DURING the eighteenth century, the house of Brandenburg, like nearly all the other royal houses of Germany, experienced numerous vicissitudes; but, worst of all, was constantly divided against itself, and agitated by domestic tragedies, which may be said to have shed a gloom on its fortunes for ever. From time immemorial, the superstitious belief had prevailed in the family, that, as a prelude to each successive catastrophe, a female spectre, habited in dazzling white, appeared in some dreary place, and at some gloomy hour, to the principal sufferer. With this tradition, every one of the princes and princesses was familiar. They regarded it as part of their destiny, and looked forward to the advent of the apparition almost as a matter of course.

The young Prince Frederic, and his eldest sister Wilhelmina, entertained a strong mutual affection, which induced them to communicate their thoughts freely to each other. This, under other circumstances, would have been a source of happiness to them. But in the palace of Berlin, happiness was a thing not to be thought of, for their father, Frederic-William, appeared to exert all his power and ingenuity to render its presence impossible. Every day, he loaded his wife and children with imprecations, threatened them with imprisonment and death, spat in the delicate dishes after he himself had been served, that they might not eat of them; attempted occasionally to commit suicide, and then took refuge in brutal drunkenness, which only rendered him still more furious and dangerous.

Frederic, afterwards, by the adulation of mankind, called the Great, was naturally driven by such paternal indulgences to seek for consolation in friendship. It may easily be supposed that he was not led by his experience to put his trust in princes. He looked for an intimate among the middle ranks of society, and the person he selected to be his Pylades was a young officer rejoicing in the euphonious name of Kat. But we must not suffer ourselves to be deceived by sounds. However unpoetical may have been his family designation, he was in himself a person of noble soul, equal to the duties of any situation, brave, romantic, generous, ready at all times to sacrifice himself for the good of others. The choice of such a friend was honourable to Frederic's judgment, and had fate permitted their attachment to become as lasting as it was strong and enthusiastic, the reputation of the philosopher of Sans Souci might have escaped many of those stains which now lower and deform it.

As the Prussian monarch, through unaccountable caprice, or the desire to wound as much as possible the feelings of his children, occasionally forbade the prince and princess to see each other, Kat was often, at such times, intrusted with messages from the brother to the sister. Misfortune almost invariably disposes people to think kindly of those who sympathise with them, no matter what may be their rank or station. Wilhelmina

beheld in Kat only her brother's friend, and as, besides being handsome, he was gentle and winning in his manners, it is not very surprising that, seeing few other men, and none that shewed any deference for her, she should have experienced a secret preference for this young officer. Sometimes, when circumstances permitted, they all three met together in friendly enjoyment. Fearing to be free with others, they on such occasions made up for their general reserve by indulging in the most unbounded confidence, passing in review the whole court, from the king and queen to the meanest gentleman in waiting.

It soon became evident to Frederic that Kat loved his sister, who, without the slightest regard to royal conventionalities, returned the feeling. An ordinary prince would have resented this; but he was not an ordinary prince, and therefore regarded not merely with approbation, but with delight, the mutual attachment of the individuals he loved best in the world. The intelligence came to him with disgust that plans, meanwhile, were in agitation at court for disposing, in the common way, both of his sister's hand and his own. Contemplating marriage from an extremely unfortunate point of view—that is, in connection with his own father and mother—it can scarcely be a matter of surprise that it should have inspired him with disgust. His French studies, also, and the practice of Germany, where nearly all princes contract what they call left-handed alliances, tended to produce the same effect. When his father, therefore, set on foot any scheme for bartering away himself or his sister, in exchange for political influence, he exerted his utmost ingenuity in thwarting him. Kat likewise, it may well be believed, made the best use of his power over the mind of Wilhelmina to deter her from entering into an engagement which would have been fatal to his happiness. These facts the Prussian king could not exactly know, though his suspicions were awakened. He had recourse, therefore, to his system of espionage. Courtiers of both sexes were instructed to keep watch over the movements and communications of the trio, who, being young and ardent, were not much upon their guard; and at length the conviction became rooted in his mind, that their singular friendship obstructed the development of his policy.

Wilhelmina had very few thoughts or feelings which she did not frankly communicate to her brother, but she had some, and among these was the strong love she felt for his young friend. He could not, indeed, fail to know that some attachment existed between them, but she shrank from confessing the extent of it, and often arranged, clandestinely, interviews with her lover. One morning, when she had just promised to meet Kat at dusk in the long elm-walk at the extremity of the royal gardens, her father sent for her into his apartments. He was suffering from gout, and sat in a great arm-chair, against which two heavy crutches, by the assistance of which he walked at times, leaned ominously. The queen stood trembling at his side, afraid to speak, but casting deprecating and imploring looks at her daughter. Wilhelmina shuddered and turned pale.

'I see,' exclaimed the king, 'that you are sinking under the weight of a guilty conscience. You know you are deceiving me, in conjunction with your mother and brother.' Wilhelmina thought of her assignation with Kat. 'I say, you are deceiving me, or at least attempting to do so. But there are more eyes upon you than you imagine. You should remember the old saying: "that walls have ears;" and that when children enter into plots, to bring trouble and disgrace upon their parents, it behoves them to display more prudence than you and your rebellious brother exhibit. But I have discovered all your schemes, and know how to punish you.'

The poor princess almost dropped to the floor. Her

father, she saw, was in a paroxysm of anger, almost approaching to madness. He turned now and then fierce and threatening glances towards the queen, who looked aside to conceal her tears, and was only restrained by terror from throwing herself into her daughter's arms. He bade Wilhelmina draw near, but she was overwhelmed with fear, and could not prevail on herself to approach him. He then attempted to rise, in order to seize her, as he had often done, by the hair of her head, but a sharp twinge of the gout supervening, he fell back in the chair writhing with agony; in the midst of which he seized one of the crutches, and hurling it with all his might at his daughter, would certainly have brought her days to a sudden conclusion, but that, bending down her head, she suffered the missile to fly unimpeded towards the window, through which it made its way with a crash into the court below. This was the signal for flight; and both queen and princess ran shrieking into their own rooms, followed as far as they could hear by the most frightful imprecations and anathemas.

As ill-luck would have it, Frederic soon after came to pay his respects to his father, whom he found entirely alone, all his ministers, courtiers, and even servants contriving not to hear his vociferations. If we had not the most unimpeachable testimony for the scene that followed, we should regard it as an extravagant fiction. When the prince entered, his father, fixing upon him a demoniacal look, accused him of entertaining some monstrous designs, which had never entered the poor young man's imagination, even in his dreams. He, therefore, repelled respectfully the charges made against him. This was too much. Anger, amounting to absolute rage, overcame the sense of pain. The king sprang from his chair, and seizing his son by the throat, dragged him with all his force towards the window, where, with the strong cords of the blinds, he attempted to strangle him. He was a large, powerful man; the son, weak and delicate; and the parricide was nearly accomplished before any of the courtiers would venture in to preserve their master from the commission of a crime which would have cast a blight over his whole life. Frederic, however, was nearly black in the face when disentangled from the cords and borne fainting out of the apartment.

An unintermitted system of persecution was now pursued by Frederic-William against his queen and his two eldest children, whose lives were thus rendered nothing but one tissue of gloom and wretchedness. His majesty's matrimonial schemes, however, suffered no interruption. As if he had been the best of fathers, he exerted himself vigorously to obtain a wife for his son, and a husband for his daughter, which he persuaded himself was all that could be desired to render them perfectly happy. His own experience of wedlock had doubtless led him as well as his queen to this conclusion! But their children remained steadfast in their unbelief, and looked upon the marriage-ring with little less horror than a compact with the Evil One. This was more especially the case with Frederic, who, in an unlucky hour, came at length to the determination to put an end to his own misery by flying into France. This resolution he communicated to Wilhelmina, with the strictest injunctions to keep the secret from her mother, who, through a mistaken sense of duty, would probably have betrayed his design. All the necessary preparations were undertaken by Kat, who, in the devotion of his friendship, braved, with his eyes open, the danger that impended over him. The slightest accident might shipwreck their project, and he knew the old king too well not to foresee that he would take a terrible revenge.

It boots not now to inquire into the means by which they raised the necessary funds for defraying the expenses of their journey, how they procured passports, and succeeded in lulling to sleep the suspicions of the

monarch and his courtiers. Kat contrived, an hour or two before his departure, to obtain an interview with the Princess Wilhelmina, who received him in her own apartment, though trembling all the while with anxiety and terror. Every footstep that moved through the corridor, every voice in the courtyard below, every whisper of the wind through crevice or cranny, represented to her in fancy the approach of her terrible father. In fact, before the young officer could make his escape from her room, the queen came rushing in to say that she was inquired for. Kat hid himself behind a screen, and when the mother and daughter had departed, stepped forth into the corridor, descended a narrow staircase with which he was familiar, and hurrying along the streets of Berlin, joined the young prince in a small grove beyond the walls, where, without companions or attendants, Frederic awaited his coming with two horses. These they mounted, and, making the best of their way towards the frontier, indulged in the flattering hope, that in a few days they should be beyond the reach of Frederic-William's pursuit or vengeance.

The Prussians even then had been drilled into tameness and submission; otherwise, as several gentlemen whom they encountered on the road knew the young prince perfectly well, they might have offered him an asylum, or aided him in effecting his escape. The utmost they did was to allow him and his companion to pass on without obstruction. This they were enabled to do during two days; but the great trial they knew would be on the third, when they should have to pass of necessity through a fortified town on the banks of a river which they could not traverse by swimming. It was with sinking spirits and the most gloomy forebodings, that they approached the gates, and beheld the walls and turrets rising like sepulchral edifices in the evening air. Frederic from time to time clasped the handle of his sword, and once inquired of his companion whether, in case of discovery, it would not be the most advisable course to imitate the ancient Romans, and put an end to their embarrassments by suicide. At the moment, he would have thought even this preferable to being dragged back to Berlin, and delivered as a prisoner into the hands of his father. As they drew near the gates, they instinctively slackened their pace, and all the philosophy of which they were masters could not prevent them from regarding each other with an expression of extreme alarm. But no choice was left but to demand admittance or to turn back. Of course, they resolved on the former; and to their surprise, the sentinels at the gate suffered them to pass without the slightest inquiry. Overjoyed at this piece of good-fortune, they resolved to make the best use of it, and pushed on to the further gate, leading over a long bridge into the open country. No one stopped them in the streets, or appeared in any way to regard them. They therefore entered the *corps-de-garde*, through which lay the approach to the gate, with reviving confidence, but in an instant were surrounded by a body of soldiers, who, before they could even think of resistance, had disarmed and made them prisoners. Frederic, almost frantic with excitement and disappointment, demanded of the officer who regulated these proceedings by whose authority he was thus arrested.

'By your father's, prince,' replied the major. 'An hour ago, you might have travelled the frontier unmolested; but a courier has just arrived from Berlin, commanding me, on pain of death, to detain your royal highness and your companion. Having myself served in the royal guards, I was well acquainted with your person, as well as with that of M. Kat, who was for some years my companion in arms.'

To this, Frederic made no reply, but requested to be conducted to the dungeon assigned for him. He was perfectly right: it was indeed a dungeon; but at first Kat was allowed to be his companion. Prussian despot-

ism, however, did not disdain to have recourse to those arts and contrivances which the princes of the house of Hapsburg have since practised with so much skill and credit against state-prisoners. By means of a small cell constructed in the thickness of the wall communicating through a narrow aperture with the dungeon, the conversation of Frederic and his companion was overheard, and carefully entered in notes, which were immediately transmitted to the king. Considering their position and their disappointment, it was no matter of wonder that they expressed themselves intemperately. Frederic did not spare his father, and Kat, unmindful of the reverence which Germany inculcates for crowned heads, indulged likewise in very strong language. When their first burst of indignation was over, they appeared to derive hope even from despair, and resolved to devote all their resources of mind and body to deliver themselves from the power of a sovereign whom they now designated as a cruel, crafty, merciless despot.

With the Princess Wilhelmina, matters were, meanwhile, little better than with them. She was under no necessity of feigning illness, for, having lost at the same time both her beloved brother and her lover, her agitation, fear, and grief threw her into a fever, during which she fell more than once into a dangerous delirium: we say dangerous, because, under its influence, her tongue lost its guidance, and syllabled perpetually the names of Kat and Frederic. In one of the intervals between one of these paroxysms, when, as it appeared to her, she was wide awake, the White Lady of Brandenburg, with a very dignified air and attitude, approached her bedside. The candles had burnt low, her only attendant was fast asleep, the wind roared fiercely in the chimney, and the hootings of the screech-owl from a neighbouring turret mingled terribly with the night-blasts. She attempted to address the spectre, which leaned compassionately over her; but no words passed between them. In a few seconds, the White Lady turned away her face, and appeared with one hand to be shrouding her eyes from some appalling spectacle, while the other was pressed closely against her bosom. Wilhelmina, in agony and trembling, watched its movements with intense earnestness. Presently, the tapers threw up a bright glare, then sank, flickered for a moment, and the chamber was wrapped in total darkness. Sleep then came to her relief; and when late, on the following morning, she again opened her eyes, the rain was beating against the casements, and her beloved friend and governess, almost in the very attitude of the White Lady, leaning over her, and wiping the perspiration from her brow.

In the course of the day, her unhappy mother, bending beneath the weight of her affliction, came by stealth into her chamber, and throwing herself into a *fountain*, hid her face in the bed-clothes, and sobbed long and bitterly. With her habitual imprudence, she disclosed to Wilhelmina the fate of Frederic and his companion, and by so doing brought on a fresh attack of fever, which nearly put a period to her daughter's life. When she saw the mischief she had caused, her regret and sorrow knew no bounds. Under the force of maternal instincts, the natural weakness of her character disappeared, and, setting her tyrannical husband at defiance with the courage of a heroine, she remained day and night by her daughter's bedside, regardless of his menaces, and for the time making light of death and life.

To describe the state of mind into which the king was thrown by his son's act of disobedience, would exceed the powers of language. It cannot be doubted that for the time at least he was mad. Encouraged by his flagitious minister, Grumeon, he resolved upon the exhibition of an awful tragedy, which should inspire all Christendom with horror. Nothing less than the blood of his son would appease his paternal resentment; and openly, in the face of day, he published his determination, and made preparations for his execution. It is

believed that the Austrian ambassador, Seckendorf, a man of the most profligate principles, likewise favoured secretly this infamous design, though all the sovereigns of Germany, as well as the king of England, exerted their utmost influence to deter the Prussian monarch from the perpetration of the crime he meditated. The greater their exertions, however, the more obstinate he became, as he appeared to regard it in the light of a victory over all the powers of Europe to put his only son to death, that he might establish universally the conviction, that he could do in Berlin whatever he thought proper, in spite of Germany and the world.

Into the political negotiations connected with this affair, our limits will not permit us to enter. We return, therefore, to the prince and his companion, who, having been removed to the fortress at which they were made prisoners, were thrown into separate dungeons in a small obscure city in the heart of Prussia. It seemed to be the object of the father to subdue the courage and constancy of his son, as well as in other respects to degrade his character, since all manner of devices were made use of to induce him to betray his friend; but to the honour of Frederic be it said, all the snares laid for him were unavailing. He persisted in his original declaration, that the plan of flight was his own, and that Kat only consented to accompany him at his earnest desire and entreaty, and after having exhausted all his efforts in the endeavour to divert him from his purpose. In this way he hoped to concentrate his father's vengeance upon himself, and save the life of his friend. Had Frederic always acted thus, no prince whose name is recorded in modern history would have better deserved to command the admiration of mankind. Kat, on his part, surpassed, if possible, the prince himself in disinterestedness and heroism. He persisted uniformly in affirming that Frederic was innocent—that neither of them, indeed, had intended serious disobedience to the royal commands—but that, in a moment of youthful frivolity, he had persuaded the young prince to accompany him on a secret visit to the French capital, where they meditated only a short stay, after which it was their intention to return to Berlin, even before their absence should be discovered.

Everything in Prussia was then conducted through military agency, chiefly because men connected with the martial profession were supposed to be less accessible than others to the weaknesses of friendship or affection. The hope of promotion, moreover, was expected to quiet any scruples which might arise in the mind respecting the humanity or justice of any transaction. Accordingly, an officer was sent to Frederic, who, having first examined Kat, came into the prince's apartment with mock humility, but with real insolence, to interrogate him respecting his views past and present—to utter the most atrocious accusations against his friend, and to extort from him, if possible, a confession of some rebellious project, which would appear, at least, to justify his father in taking away his life.

Through this ordeal, Frederic passed with great intrepidity and success. He repelled, with scorn and indignation, the calumnies attempted to be fastened on Kat, and maintained unflinchingly that the error of that gallant young officer arose solely through mistaken friendship and affection for him. The spy, who had evidently been drilled at court, now adroitly threw out certain hints respecting the feelings of Wilhelmina, which so incensed Frederic, that he instinctively moved his hand towards where his sword had used to be, and would unquestionably have run his interrogator through the body had the trusty weapon been still within his reach. Recollecting himself suddenly, he turned a look of intense scorn upon the military inquisitor, and said: 'If my father forgets himself, you would feel it to be your duty, were you a gentleman, to spare the honour of his daughter. The Princess Wilhelmina stands far beyond the reach of vulgar suspicion and calumny.

She is my sister, sir; and the time may yet come when it will be in my power to chastise all those persons who dare to cast aspersions upon her. For myself, you are welcome to heap on me every insult suggested by low and base natures. As a son and a prince, I shall submit, because it is my father's will. But let the vicissitudes which constantly take place in the affairs of this world suggest to you the prudence of remaining within the limit I prescribe to you; for, be assured, I have a memory which will treasure up whatever may be now submitted to it, whether for good or evil.'

The officer professed, and no doubt with truth, his willingness to be convinced by this reasoning. He also protested that he was acting strictly under orders, and said he would faithfully represent to his majesty the respectful and obedient state of mind in which he found the prince. Immediately afterwards he took his leave, and during the remainder of the day Frederic was not disturbed by the entrance of a single individual; even his food was forgotten to be brought to him, so that he became the victim of physical as well as mental depression. Not a footstep was heard in the neighbouring chambers, no sound of a sentinel in the court, and as he looked forth through the iron bars, he could behold nothing but a few withered leaves blown hither and thither by the wind. The sun shone faintly on the dusky walls, and a faintness came over him as the sense of absolute silence and stillness fell upon his heart. He had no books from which he might have sought some relief; his chamber was bare, containing nothing save an iron bedstead and a wooden seat, on which from time to time he threw himself in despair. The hours wore away, the shades of evening came on, and by degrees thickened into absolute darkness, and yet no attendant appeared either to bring him light or a morsel of bread. Being of a feeble constitution, this long abstinence affected him so much that in the course of the night he fainted on his bed, and remained plunged in a sort of stupor till morning.

When he came to himself, his mind was in a state of indescribable depression; stillness and silence continued to prevail throughout the fortress, where nothing but himself seemed to be endowed with life. Long he lay motionless on his hard pallet; but his feelings growing more and more painful every moment, he sprang on his feet and approached the window. Did his eyes deceive him, or was he plunged in some horrible dream? Concentrating all his soul in the sense of sight, he looked forth into the court with frantic terror. Darkness pervaded earth and air; yet through the gloom he could discern one object but too distinctly: it was the body of his gallant and intrepid friend dangling from a low gallows, which had been erected during the night, exactly opposite his window! He fell senseless on the floor, where he was found some hours afterwards by a common soldier, who, it is said, without orders, had sought the apartment out of pure compassion. For some time he supposed the prince to be dead; at length, however, he revived, though not to the same life he had lived before. The whole economy of his thoughts and the constitution of his mind were changed. He uttered no lamentations or threats, but one fixed purpose seemed to have taken possession of his soul—life and death appeared to have become indifferent to him. He refused to utter one single syllable when an officer entered to interrogate him, and the food which they at length bethought them of offering to him, he motioned away with a wave of the hand. Like his sister, he found relief in sickness, and the death with which his father had threatened him appeared for many days to be coming of its own accord.

In due time Frederic recovered, and in the course of years he became king of Prussia. He then remembered the murderers of Kat. The chief murderer was, he knew, beyond his reach; and so, when he came to make inquiries, were the others, for, bearing in mind that he

possessed a memory, they had vanished from the kingdom of Prussia, and sought refuge in other parts of Germany. Wilhelmina, whom, to the latest hour of his life, he loved tenderly, never forgot her attachment for Kat, and in the midst of war and political excitement, and the cravings of literary and philosophical ambition, Frederic often devoted whole hours to conversation with her. They then recalled the happy days they spent together with this only friend, whose memory they both cherished to the last. If it was Kat's ambition, therefore, to be loved, he succeeded, since he left in the minds of the two individuals he valued most, the deepest possible remembrance of his unexampled affection and fidelity.

### THE MONTH:

#### THE LIBRARY AND THE STUDIO.

##### THE LIBRARY.

THE Russian and Turkish books which are the natural consequences of the present state of eastern and northern affairs, are, upon the average, of a mediocre quality—got up for the market, and a great proportion of them bearing evident marks of barefaced manufacture. Only one or two works have appeared shewing traces of their authors having been actually on the field, and eye-witness to the exploits of Omar Pacha. The London morning journals, however, with their usual enterprise, have sent special correspondents to the Danube and to the Asiatic side of the Euxine. Several of these gentlemen have gone out with the regiments, and we are already receiving from them letters marked no less by intelligence than graphic power of description. The French government are despatching, under the wing of their military and naval forces, able military recorders, marine and battle painters, with that most useful class of artists—photographers. We understand that General Raglan means to convey to the scene of action one chronicler, one painter, and one 'sun artist.' Happily, many of the officers are both artists and authors, by land and sea, and we may expect a copious crop of productions in both departments, which will have the great advantage of actual authenticity, and graphic description and illustration. The Baltic, we observe, as well as the Euxine, is also beginning to call forth its describers and chroniclers. We already have travellers who either indite from the fortified towns and rocky channels of the north, or hasten to put upon paper the reminiscences of former journeyings through the Sound or the Great Belt—with perhaps a summer excursion as far as Cronstadt. At all events, there is no doubt that the history—military, civil, topographical, and illustrated—of the war east and north, will be written and portrayed in far more detail than were the great contests of the Republic, of the Empire, and of the Peninsula, in their meagre gazettes and apocryphal war-journals touted round the streets by vociferous postmen.

Turning from the literature, present and to be expected, of the war, we proceed to notice a few of the most remarkable books of the past month, and amongst these we may class M. Guizot's *History of Oliver Cromwell and the English Commonwealth, from the Execution of Charles I. to the Death of Oliver Cromwell*. Bentley.—This is an important work, full of new information of every species, from contemporary memoirs, from the state-archives both of France and England, and from histories of the era published down to the latest date. The style of M. Guizot is at once dignified, picturesque, and vigorous. The subject, indeed, demands this, and he at the same time throws the illumination of a calm and clear philosophy on the agitated state of the nation at the time, the ferocity and fanaticism of the Puritans, the fierce and vigorously

urged policy of the Protector, the great events which that produced, the dissolution of the Long Parliament, the Scotch and the Irish battles and victories. Nor are the effects of Cromwell's foreign policy neglected. On the contrary, the chapters touching them form both the most interesting and the most novel portion of the work. The execution of the king, the rapid career of success of the Puritan party, their marvellously soon acquired domination over the three kingdoms, the all but total subversion of the national church, and the enthronisation of the great leader, not in Westminster Abbey, but in Westminster Hall, where he was girt with a sword of state, clad in a robe of purple, presented with a rich Bible, and styled, if not His Majesty, at least His Highness—all these events astonished the entire continent. Once firmly established on his throne—for it was a true throne—he commenced a career of foreign policy of unsurpassed glory. He dictated peace to the United Provinces—avenged the injuries of Christendom on the pirates of the Mediterranean—seized Jamaica—and made himself almost a Puritan pope over the reformed communities of the continent, declaring to the descendant of St Peter, that 'unless mercy was shewn to the people of God, the English guns would be heard in the Vatican!' On all these topics, M. Guizot throws new light, chiefly in letters from Louis XIV. to Cromwell and Fairfax—which are now given to the world for the first time. Altogether, the last work of the French historian and statesman is one tending to diffuse great information and excite great interest in this and other countries. We may add, that M. Guizot has been fortunate in his translator—Mr Andrew R. Scoble—the style of whose English is highly commendable.

*Finland: Notes Collected in 1848, during an Excursion from St Petersburg to Torneo, by Prince Emmanuel Galitzin.* Paris.—We have here a Baltic book of a different calibre from the majority of those which we noticed at the commencement of this paper, matters political being in a very different state in 1848 from what they are in 1854. The topics of the travelling prince embrace only the themes of peace in a copious description of Finland. He descants upon its coasts, its floods, its mountains, its multitudes of lakes, offering great facilities for navigation, many of them communicating with each other—an important circumstance, since the mountain-roads are difficult and dangerous. The soil consists generally of a sandy loam; but it would appear that its fertility has declined since the tyranny of the czars has been exercised on the peasantry, instead of the mild rule of the Swedes, its rightful possessors. Finland abounds in rivers, some rapid, and all clear save one, the Cano, which is obscured with the mud of its channel. It would be impossible, in our limited space, to follow the multitudinous details touching climate, vegetation, minerals, such as lead, iron, slate, and granite, of which great quantities, and of the finest quality, are quarried. Passing, however, from mining, the prince notices the extent of cattle-rearing and fishing: he enters into more statistics of production than we have room for; gives an account of the Russian constitution of this vast province, sketches its towns, harbours, fortifications, and particularly two towns—the former Viborg, one of the most important places in the country, from its situation on sea-beaten rocks, fortified to the highest peak; and the latter, Helsingfors, which possesses the same advantages, but in still greater degree. The prince narrates at much length the varied fortunes of this fortress, which passed alternately from the Swedes to the Russians, and vice versa, until, in 1810, it was betrayed finally to the then ruling czar by the treachery of Admiral Cronstadt. This short *résumé* is intended to convey an idea only of the general character and amount of information garnered in the prince's *Notes Recueillies*. Incidentally, the accounts of the fortified

seaport towns give at this moment to the volume an interest and a value which it is probable the author never dreamed of when engaged upon his lively and comprehensive work.

*The Poetical Works of John Keats, with a Memoir by Richard Monckton Milnes.* Moxon.—Every new edition of Keats is a slap in the dead faces of his traducers. The more the pity that the poet's delicate, tender, and exquisitely poetic mind should have felt so keenly the hostility of the rude, cold, heartless, and lightless intellects which assailed him. But though kind friends supported him, and, what was better, appreciated him, of the two great literary organs of the day, the *Edinburgh* damned the budding poetic blossom with faint praise, and the *Quarterly* trampled it savagely and ignorantly beneath its rude feet. The fact is, that a new light was rising—that the luxurious, aspiring, emblazoned diction of the old poets was beginning to raise, and illumine a band of youthful aspirants, when they were set upon by the Cossacks of criticism—men who paid no reverence to, and had indeed little or no knowledge of Spenser and Chaucer, or of the mighty old dramatists, the pedestals of Shakspeare, or of the delicate subtlety and fine poetic cunning of the poets of the early part of the seventeenth century—such as Donne, or, in lesser degree, Cowley—contenting themselves with the attenuated though elegant, weak though witty, poetry of the time of Anne. These were the men who, not appreciating Keats and several of his contemporaries, Leigh Hunt, Hazlitt, and even Lamb, indulged themselves in criticism, which present reviewers would shrink from, and as Shelley well said, 'hooted Keats from life.' The present edition has nothing of novelty, but Mr Scarf's illustrations are very beautiful.

#### THE STUDIO.

Since the last 'Month,' two exhibitions have been opened—that of the National Institution of Fine Arts in the Portland Gallery, at the top of Regent Street; and that of the Society of British Artists in Suffolk Street, Pall Mall East.

The former, which comprehends among its contributors not a few mediocrities, attains, nevertheless, to a greater degree of merit than it did last year. The worst of it is, that it is flooded with landscapes, most of them—particularly those of the Williams family, one of whom alone contributes fifteen works—being of a more or less monotonous character: Welsh landscapes, moonlight effects in forests, or brooks, heaths with sheep, glens, mists, harvest-homes, English lanes, and so forth, all treated in much the same manner. No. 48, by Arthur Gilbert, is the gem of the collection, *A Calm Evening*—a beautiful effect of setting sun over a placid river, rushes, and water-plants; on the right bank, which is in shadow, but still discernible, trees magnificently depicted; in clumps on the left, with the sinking rays of the sun upon a third of their higher branches, the lower and the trunks in shade. The water is painted with vivid truth; and, altogether, this is the landscape of the exhibition. One of the best *genre* painters is Frederick Underhill. His subjects are generally rustic children, in vigorously painted bits of landscape. E. J. Cobbet is another pleasant boy and girl painter. Mr J. E. Lauder contributes several ambitious works, among them *The Ten Virgins*. Here the grouping is good; the wise and foolish virgins are flung, the wise in the light, and the foolish in the dark, telling the story. John Surtees, besides several sweet landscape bits, gives *Blooming Heather*; the heather, deer's foot, and heath, well painted; and a capital couple of young moorlanders, boy and girl, coming merrily along with bundles of furze upon their backs. Samuel D. O. Swarbrick has a remarkably clever Chester gallery, with all its quaint perspectives, its lights and shades, falling on characteristic living life and still life. Alfred Provis contributes a most delicately

painted Breton interior, and several other pieces of the same class. Mr Glass, who has produced so many characteristic cavaliers and moss-troopers, disappointed us in his *Escape of Queen Mary from Lochleven*. The royal fugitive sits with an unexpressive countenance on a stiffly galloping horse; while Douglas rides beside her and looks behind. The water of the midnight brook, through which they are plunging, is by no means well painted; and, altogether, the work is inferior to *The Raid*, or *The Guide*. With the mention of these few works, we have indicated the best specimens in the Gallery.

The Society of British Artists does not seem to be by any means keeping up its character. Its fault is a want of elevated subject. As in the National Institution, there is an overflow of landscape, so monotonous that the eye wearies under the tameness. Of historic subjects there are remarkably few compared with the number of works, 555; and of sacred subjects still fewer. Pictures of *genre* certainly abound, and of still life many highly finished specimens may be observed: *mais que valaient ils?*

To Mr Hurlstone, the president, we always look for Spanish subjects, done, as much as possible, after Murillo and Velasquez; but out of nine, six are portraits, and the remaining three are Moorish, and of these we must do them the justice to say, that they are well drawn, richly and harmoniously painted, and full of the national expression. The best of the landscapes are those by Mr Boddington, who contributes nine, all superior works, of mountain, river, and lake scenery; and those by Mr Clint, who has a stormy sea-scene off Scarborough, which shews fine feeling for marine, and rock, and gloomy sky scenery. After a charmingly painted cabinet picture, struck off to the life—the bustle of a French port—the rest of his contributions are mountain and river landscapes. Mr Pyne sends Italian landscapes; and Mr Zeiller—whose works are generally Norwegian landscapes, and sledges in snow-storms, chamois-hunters and shepherds—this year changes his quarters to Walachian mountains and mountaineers, which he paints with the same vivid snow effects, and well-drawn men and horses. There are a multiplicity of other landscapes, the general character of which we have indicated. And as *genre* cabinets, we may mention, in conclusion, Mr C. Baxter's graceful treatment of *La Pansa*; and another work of the same class, Mr Collins's *Juliet*, which is full of sweetness and tenderness of expression. Still another graceful head is that of Mr Havell's, the subject Adeleine, from Tennyson. *The Gleaner*, by Mr A. Fussell, is a small work, but of much promise.

A few days ago the Royal Panopticon was opened. This building, situated in Leicester Square, is perfectly unique of its kind: it is the only specimen of pure Saracen architecture in England—the representation, in fact, with some necessary alterations, of the most perfect hall existing in the Alhambra; the Saracen style being preserved to the minutest detail, from the horseshoe arch of the gate, to the tessellated glass of the fountain, the Moorish lamps, and the Moorish cyphers and emblazonments. Inside, the blaze of adornment is startling. The general form of the hall is round: the three galleries which run along the walls are supported by fourteen pillars. These pillars are diversely ornamented with beautiful Moorish arabesque, in various styles, and lead up to the dome, which is a blaze of decoration disposed in broad belts, each differing from the rest, and rising on a circle of horseshoe arches—a circular light in the extreme height of the roof, which is 97 feet, the diameter of the hall being the same. The building is intended to be devoted to science and to the manufacture of the most elegant of household articles, in a great variety of departments; as yet, the rule being that everything sold upon the establishment is to be made within its walls.

We only refrain now from a more extended description, because an article treating the subject at a length which would be inadmissible here, has been prepared, and will presently appear.

We looked the other day into the studio of Mr John Jones, to view the plaster casts of Her Majesty and Prince Albert, which Mr Jones had recently presented for inspection at Buckingham Palace. This is the first bust ever modelled of Her Majesty with the lips closed, and we fear we can hardly style it an improvement to the face; but tastes differ, and we shall certainly not discuss so delicate a point: at all events, both busts are exceedingly like the royal sitters. In the studio, are a similar pair of casts of the Emperor Louis Napoleon, and the Empress Eugénie, also by Mr J. Jones. Of the former we can speak: it is strongly characteristic. The empress too, particularly in her exquisite profile, is a close resemblance.

There is on exhibition in Marlborough House a very curious collection in terra cotta—and one or two in wax—of model statuettes principally executed as designs for great works by Michael Angelo, and a single specimen by Raphael. Only six or seven out of fifty are of real value. A wax model of a skeleton, by Michael Angelo, is a wonderful piece of art; and a magnificently moulded hand grasping a bowl, has been vainly attempted by hundreds of imitators. A monumental recumbent figure, for a tomb of the Medici in a church in Florence, is very striking; and a group of Hercules and Cacus, although much injured, is a most vigorous piece of struggle. The Raphael is called a Jonah, representing that personage as a prophet. The attitude is an outstretched one, shewing all the limbs, of which the modelling is the most exquisite thing that can be imagined. The collection is stated to have remained long hidden in a house in Florence. It has been successively offered in vain to the Austrian and French governments, and it is now here to tempt the English. The Jonah, we understand, is valued by several high authorities at L.1500; if so, how much for the Michael Angelos?

#### THE GREAT STEAM-SHIP.

The ways for laying down the projected immense screw and paddle steamer for the Eastern Steam Navigation Company are in the course of completion at the yard of Mr Scott Russell at Millwall. Many hundreds of tons of iron for her keel are ready to be put together, and the contracts have been signed for the completion and launching of the ship within two years. The extreme length on main-deck will be 700 feet, being 430 feet longer than the *Himalaya* steamer; extreme length of keel, 680 feet; extreme breadth of beam, 83 feet; depth of hold (forming four decks), 58 feet; length of principal saloon, 80 feet; height of ditto, 15 feet; tonnage, 10,000, or builder's measurement, 22,000 tons; stowage for coal, 10,000 tons; stowage for cargo, 5000 tons; 500 first-class cabins, with ample space for second and third class passengers, besides troops, &c.; while her screw and paddle engines will be of the aggregate nominal power of 2800 horse. She will also carry an immense quantity of sail. The principle of construction, as designed by Mr Brunel, will be similar to that of the tube of the Britannia Bridge. Her bottom, decks, and sides are to be double, and of a cellular form, with 2 feet 6 inches between. She will have fourteen water-tight compartments, also two divisional bulkheads running her whole length, so that it would appear as if the principle of the T girder, as we suggested, only in this case doubled, were comprised in the new principles of construction. The great length of the ship, it is contended, according to all present experience, will enable her to pass through the water at a greater velocity, with a similar power in proportion to her tonnage, than ordinary vessels now require to make ten knots an hour, and that speed is, in fact, another result of great size. The immense proportions will admit of carrying sufficient fuel to accomplish a voyage round the world.—*Builder*.

#### THE UNIVERSAL.

BY W. STEDMAN.

Is there an eye that looks around,  
O'er heaven and earth, o'er land and ocean,  
And sees no gentle things abound,  
To stir the soul to sweet commotion?  
No voiceless song of harmonies?  
No music sounded through the eyes?

Is there a soul that dwells within  
An eye of hazel, brown, or blue,  
That sees not, 'mid the clash and din  
Of changing worlds, a beauty too?  
Serenest sunbeams resting lightly  
O'er the volcano, burning brightly.

In every ray that falls on earth,  
And from that earth reflected rises,  
There is a joy, a gentle mirth,  
That soon the captive soul surprises;  
Sweet glimpses of the lost ideal,  
Flashing about the transient real.

The pretty flower that decks the lea,  
Each day its bosom opening wider,  
Yields choicest honey to the bee,  
But poison to the bloated spider.  
And are there hearts and eyes that see  
This difference of philosophy?

As with the part, so with it all;  
As with the flower, so with creation,  
And there's for hate, as bitter gall,  
As honey sweet for adoration.  
Ah! honey sweet, a busy bee,  
Let's work in thy philosophy.

#### PRESTIGE OF SPECTACLES.

I descended to the Kulhait river, on my route back to Dorjiling, visiting my very hospitable tipping friend the Kajee of Lingcham on the way down. He humbly begged me to get him a pair of spectacles, for no other object than to look wise, as he had the eyes of a hawk. He told me that mine drew down universal respect in Sikkim, and that I had been drawn with them on in the temple at Changachelling, and that a pair would not only wonderfully become him, but afford him the most pleasing recollections of myself. Happily, I had the means of gratifying him, and have since been told that he wears them on state occasions.—*Hooker's Himalayan Journals*.

#### THE WIDOW'S ERRATUM.

A printer's widow in Germany, while a new edition of the Bible was printing at her house, one night took an opportunity of going into the office to alter that sentence of subjection to her husband, pronounced upon Eve in Genesis iii. 16. She took out the two first letters of the word *HERR*, and substituted *NA* in their place, thus altering the sentence from, 'and he shall be thy Lord' (*Herr*), to, 'and he shall be thy Fool' (*Narr*). It is said her life paid for this intentional erratum, and that some secreted copies of this edition have been bought up at enormous prices.—*Curiosities of Literature*.

**CHAMBERS'S REPOSITORY OF INSTRUCTIVE AND AMUSING TRACTS.**—This Illustrated Work resembles in some respects the MISCELLANY OF TRACTS published a few years ago, aiming at a higher, though not less popular tone, and will satisfy, it is hoped, the new requirements of the day in regard to literary elegance—the papers being original compositions, prepared expressly for the work by popular and practised writers. A Number appears every week, a Part every month, and a Volume every two months. Nine volumes (1s. each) have now appeared.

Part XIX. just issued, price 5d.

Printed and Published by W. and R. CHAMBERS, 3 Bride's Passage, Fleet Street, LONDON, and 339 High Street, EDINBURGH. Also sold by J. McGLASHAN, 50 Upper Sackville Street, DUBLIN, and all Booksellers.

SATURDAY, MAY 6, 1854.

PRICE 1½d.

## SOCIAL POLARISATION.

THE death of the amiable Judge Talfourd at the moment when deploring, as a cause of demoralisation and crime, the separation of classes in English society and the want of sympathy between them, has lately brought those sad social facts again prominently under notice. For a few years, they have been kept comparatively out of view, in consequence, apparently, of the great changes flowing from the general liberation of industry; but, like nature, however they may be expelled, they will be sure to recur and draw attention, so long as they continue to have any existence.

It becomes a profoundly interesting question, Can this separation of classes and consequent division of sympathies and interests be remedied? With a great indisposition to consider this question unhelpfully, we must confess that, notwithstanding such partial efforts in the right direction as entertainments by masters to men, gentlemen coming forward as popular lecturers, societies for improving the dwelling-houses of the working-classes, and the interest taken by gentlefolks generally in the getting-up of schools, we see a powerful tendency to a continually widening separation—a tendency which seems inseparable from that very freedom we possess of pursuing each his own worldly interests, on which the activity of our industrial system so much depends, and against which no one will listen to a single word.

It is allowable to put this matter to the proof of a personal appeal, and we would therefore ask the best inclined master and mistress, of the middle classes, if they feel it to be possible to come to more familiar terms with their servants. We would ask any candid individual, accustomed to live independently of trade, and tuned to the proud refinements which a superiority to drudging industry produces, if he thinks the time can ever come when he will condescend to be on visiting terms with any of his *trades-people*. The responses are only too well known before they are uttered. On the continent, as we well know, there is less fastidiousness, because, less advanced in industrial organisation, the circumstances of individuals have not yet arrived there at so great a discrepancy. It is here we read a solution to the riddle, that England is voted as at once the most mercantile and aristocratic of countries. It is a thing, unfortunately, which acts and reacts, for, as the withdrawal of the high goes on, the low, from want of the influence of their superiors, are thrown lower, and, thus becoming the more repulsive to that class, tend to be further separated from them. The process may be described in a word, by borrowing an idea from one of the physical sciences: it is social polarisation.

It has revealed itself in many prominent facts of the last hundred years. We see it in the constantly increasing disposition of the more comfortable classes in large towns to draw off into *west ends* or other detached districts, leaving their inferiors to herd in large masses, free from their leavening influence. In our own city of Edinburgh, for example, high and low once lived in literally the same houses, though in different floors, and many kindly charities must then have been exercised between the rich and poor, since the one class came daily before the eyes of the other. Now, the one class lives in the *new town*, and the other in the *old*, with no connection between them beyond what may be kept up by missionaries and the agents of benevolent societies. So also in old times, when farmers were plain, drudging men, they were content to live in the same apartment with their engaged assistants. Their own sons and daughters, if they had a superfluity of them, being liable to go out and act as servants to others, they never thought of any degradation or even condescension attending this practice; and, according to all accounts, while the farmer and his family were perhaps less exalted as moral beings than they are now, the servants (if it be just to call them by such a name) were not less remarkably superior to the occupants of the *bothies* of our days. The present farmer, working a good capital in his business, and enjoying many of the refinements of life, cannot live with his servants—can still less allow his children to live with them: the servants, therefore, must needs herd with each other, without any of that benefit which they formerly derived from the moral influences, such as they were, which were exerted by their masters in their daily intercourse. In like manner, the small manufacturer of the early part of the last century had all his apprentices, and many of his other hands, as inmates of his house, where, of course, they must have been somewhat tempered by any moral force that might reside in himself. The large manufacturer of our day stands hopelessly separated, in domestic respects, from his work-people. These must needs live amongst themselves, with no spark of a sustaining or elevating social influence among them, except the comparatively abstract and weak one which the zealous clergyman may attempt to bring into play, he being at best but a visitor, not an associate or a neighbour. It is refinement that does all this. It is refinement that shuts us up in our handsome houses, that forbids us to address our servants kindly and confidentially. Such, really, is the paradox of our civilisation. Raising society at one end, it depresses it at the other. We are, in a word, *polarised*.

We have, then, great systems of industry, tending to concentrate and economise means, and to increase

wealth, but just as clearly tending to widen social distinctions, and so create great and painful problems in another direction.

But, it is said, the worker gets his fair share of the proceeds of this new style of industry: he has far higher wages than he formerly had. Quite true. From the cheapness, too, effected by the concentrated industry, the workman of our time, even though he had still only the same nominal wages, could now command a far larger share of the luxuries of life than he ever could before. As it is admitted that the working-class are in a less satisfied, as well as satisfactory state, than they were long ago, the necessary inference is, that they make a worse use of their advantages than they might and ought to do. Well, this is in a great measure true also. It has even been found that crime rises and falls amongst them in attendance on rise and fall of wages—Judge Talfourd stated this in his last speech—and it is a common observation among masters, that, as a rule, the higher paid workmen conduct themselves least respectably, and bring up their families worst. It is a fact to the same purport, though not generally seen, that we never heard till these days of large operative gains, of there being so much to find fault with in the dwellings of the working-class. Undoubtedly, were their now larger incomes managed as well as their formerly low wages were, houses would be provided for them on the ordinary principles of trade, instead of being left to the partial and inadequate efforts of employers and benevolent associations. But how comes it that the higher gains tell so ill for the benefit of the class? We have pondered much on this question, and for years found no sort of rest in it. We have turned it in all sorts of lights, and viewed it in every relation we could think of. One point we have latterly concluded upon as quite clear—namely, that for so broad and constant a result, only some large, pervading, and tremendous cause could account. There must be some terrible tendency, or some terrible deficiency, in the state of the lower labouring world, under our new industrial dynasty. Well, is it not just the widened distinction which has taken place between employer and employed?—the increased hopelessness of passing from the one condition to the other, in consequence of the comparatively large capital now required for mastership?—and not merely the larger comparative capital, but the larger comparative skill, will, self-denial, moral force of all kinds. It is notorious that the well-paid artisan, with an employed family, will realise more income than many a working clergyman or schoolmaster, while it is ten to one that he even makes the attempt to use it equally well. To lay up any part of it does not occur to one in a score, or if it occurs is set aside, with, 'What is the use of my saving? I cannot sensibly increase my income by it—it would perish at the first exigency.' There is, in short, an absence of some needful self-working principle in his case—something analogous to the cheap defence of nations—that would save us this continual distressing, worrying crusade for the elevation of the labouring masses, by making them elevate themselves. Is it not simply that the motive power of Hope—that power which causes the merchant and trader to continually strain to make the little more—is wanting in the workers, placed as they now are in a system where wealth always creates wealth in an increasing ratio, and the destruction of the poor is peculiarly their—poverty, we were going to say, but it is more just to say, a degree of means larger absolutely, but smaller relatively, and so far as its power of accomplishing progress for the holder is concerned, than formerly fell to their lot?

The fact undoubtedly is that some men rise from the condition of operatives into that of masters, for some of our greatest manufacturers are known to have been originally working-men. It is a possibility for some sin-

gularly constituted and happily circumstanced men thus to rise; but it is not sufficiently easy to do so, and the examples do not tell upon the multitude. Once a man has fairly got into the capitalised and employing position, he obtains the benefit of that gale of antagonism, which continually works to the making the master's little more, and if he possess real prudence and self-command, he probably ends in wealth. But below that point, there is continually blowing an equally powerful gale in the contrary direction. The ultimate divarication is startling. We contemplate at this moment a family of clever prudent men who have risen from a lowly sphere to enormous wealth, and are now planting themselves in the superb halls and broad estates of the ancient gentry, while the armies of their workmen are generally so devoid of any tendency to make an economical use of their gains, that it is thought to be a real, though negative benefit to them, to be called upon to purchase the necessities of life from stores established by their masters—establishments which in themselves yield the masters a handsome income. It is not merely a separation of conditions and sympathies which we have to deplore, but a constantly widening distinction in intellect, force of character, and morals. The masters, merely as human beings, become colossi; the men are dwarfed. And how is it to be wondered at, when the former see every day how additional capital and additional character are the means of improving fortune, while the latter have neither any immediate use for saved money, nor any reason to think that their morals will in the smallest degree affect their prospects?

Society may wail over this spectacle; but we more than fear that, in the circumstances, the antagonism is unavoidable and irresistible. It is a principle deep founded in the constitution of the world, and which we see working in every moral scene. It may be a strange consideration, but it is a true one, that beyond a certain point, even virtue reacts unfavourably on society. The *very good* are the cause why there are others *very bad*. It is because very good people necessarily abhor vice and error of all kinds—throw it off from them, fly from it, leave its victims hopelessly condemned, and therefore liable to become worse and worse. The moderately good, not viewing it with such repugnance, retaining still some sympathies for their erring brethren or sisters, give them, it may be said, a chance. By keeping them in their own congregation, they may even exercise some good influence in recovering them. It has often been wondered at that certain out-cast classes are so much more wretched in this country than in others; but it is simply because good society is so much more fastidiously moral here. We claim—and in all sincerity think we are acting very right in claiming, the privilege of 'cutting' this person and casting off that, of denouncing this man's guilt and that woman's sin, and resolving to have no more to say or do with this person and that person; never once reflecting what is to be their next move after our withdrawal, although we see in numberless instances that it is a downward one. In a less high-strained society, there is no such casting out, and while the best are but tolerably good, there are none so very bad.

It is a very natural idea to occur—it is no worse to you that I am much richer, more refined, more virtuous than you, and why should you complain or be envious? But there is, we see, a ground of complaint after all in these discrepancies. Great means in a few hands do most undoubtedly crush the commercial efforts of small men, although perhaps redounding to the good of the entire community. Extreme refinement keeps common breeding at a distance, and allows it no chance of improvement. Exquisite morality directly tends to produce the too well named 'abandoned.' All these things we see at work in this advanced society of ours, and blossoming abundantly in heart-burnings and

strikes among the workers, and a *lues populi*, such as nobody dreamt of when the phrase was first used. Are there any remedies to be had? No nostrums, we suspect, though facilities for small joint-stock concerns among operatives may be admitted to be a hopeful means of somewhat correcting that reckless frame of mind in which so much of the evil subsists. The thing, to all appearance, will go on, on, on, perhaps with some occasional checking and correction, but on the whole stretching the paradox wider and wider, till either it cracks in terrific confusion, or some great prophet arises to give mankind a new direction and a better destiny.

## WEARYFOOT COMMON.

### CHAPTER XVIII.

#### TRAVELS OF DISCOVERY.

THE dinner-carriages had disappeared. So had the cabs bound for the theatres. The omnibuses were few and far between; and more than an hour ago those persons who patronised neither cab nor omnibus, but walked home from business, had reached their suburban dwellings and six o'clock tea. The visible population of London had changed its character, both in respect to numbers and appearance. The females had an air of directness, as if they had chosen the hour for business; the men wore generally that solitary look which betrays the want of a family fireside; the policemen mustered strong, having sallied forth to take their promenade uninterrupted by the crowd, or to make the agreeable to Polly, who had come up from the hot kitchen, when the dinner was fairly off her hands, to breathe the fresh air on the area-steps. London was mostly within doors. Some of the inhabitants were at dinner—these were the aristocrats; some had already dined, and were chatting over their wine—these were the upper middle classes; some were at tea—these were the lower middle classes; some had left tea more than two hours behind, and were longing for supper—these were the small shopkeepers and hand-workers. The guest-rooms of most of the houses were full; so were the theatres; so were the exhibitions; so were the popular churches where evening-service was performed; and in a proportionate degree the streets were empty. But it was not a gloomy void that was thus presented; for the shop-windows blazed, and the long lines of gas-lamps sparkled like stars in the blackness of the evening.

In approaching the suburbs, the glare was gradually left behind, the shops and lamps becoming fewer, and the former sometimes disappearing altogether. The aspect of the scene, early as the hour was, became decidedly solitary; and this character was aided even by the few lights, occurring at regular but distant intervals. The road leading towards the Bayswater suburb, so busy and so gay a few hours ago, might almost be described as dreary; the country-like expanse of Hyde Park being left behind, and only the blank wall of Kensington Gardens lining one side of the way. When a solitary cab was seen to stop here at one of the turnings, the few *piétons* passing regarded it as a relief, and looked with languid curiosity at the descent of the single person it contained. Those who did so turned to look again; for although the individual was shrouded from head to foot in a black cloak and veil, with the hood drooping far over her bonnet, there was an unmistakable air of distinction in her

walk and carriage. She moved quietly along, however, up the turning, and the spectators passed on their way.

The lady walked slowly and collectedly up the street, as if she was going to her own or a neighbour's house; but when she had gained the end, she paused and hesitated. Streets were on all sides—before, behind, and on either hand. She chose the left, and thus proceeded further to the west. At the end of that street there was another pause, another self-consultation, and she turned to the right. Then came a longer pause: the evening was dark, the lamps few, the wilderness of brick and stucco seemingly interminable. Occasionally somebody passed her, and turned round to look: this made her quicken her steps. Once or twice a policeman turned the bull's eye of his lantern upon her veiled face, and then wheeling about, followed her; but gradually his pace became slower, and then he altogether abandoned the pursuit. This is an ordinary ruse of the Force, who calculate on the individual followed, if conscious of having been at any unlawful work, betraying his delinquency by taking to flight; but in the present case the veiled lady did not run, but glide at what appeared to be her usual rate of speed.

She at length seemed to regret her reserve or timidity, and looked round as if in search of some one to direct her. A servant-girl at the moment came out of one of the houses, and she addressed her.

'Kensington Gravel Pits?' said the girl. 'Oh, you must take that street opposite, and go on a good step. You are from the Tyburn way?'

'Yes.'

'Well, you see you have come out of your road. Hartwell Place? I don't know that; you must ask again when you get nearer it.' The lady bowed and glided on, and the girl stood staring after her till the black figure was lost in the black darkness.

Soon after this, while the solitary wayfarer was passing a house of some pretensions, the door suddenly opened, and from the brilliantly lighted hall several young men, who had apparently been too familiar with the wine-decanter, issued forth in boisterous merriment. One of them, struck with the nun-like figure that was gliding past, followed her, while his laughing companions incited him to the chase with a view-hollo that made the street ring. The lady quickened her gliding pace—quicker—quicker—till the gentleman fairly ran, and at his highest speed. She distanced him for a time, turning several corners, and darting across several streets, till at length he was sensibly gaining upon her, and would perhaps have ultimately won the race, had not his foot been caught by a large stone, which brought him down with a heavy fall. Two policemen turning the nearest corner at the moment, witnessed the accident, and seeing a female in the act of flight, one of them pursued her, while the other went to the assistance of the gentleman, who lay stunned upon the street.

The policeman was a still more dangerous enemy than the gentleman, for he sprang his rattle as he ran, and presently the terrifying sound was heard taken up at several points, some distant, some nearer, as if by echoes. When turning the next corner, the fugitive was intercepted and caught roughly by the arm, while the glare of a bull's eye was turned upon her face. Still she spoke no word; and when the pursuer came up, the two were about to lead her back to where the supposed offence had been committed, when the footsteps of the other policeman were heard thundering along the street, and his voice exclaiming: 'All's right—Let her alone!' When he approached, he explained that the gentleman had fallen by accident, and that the lady ran only because he had frightened her: even before he had finished she had moved away in silence as before, and was already at some distance.

'Are you sure you are right?' said one of the trio. 'Isn't it odd, that if frightened, she didn't cry out? I don't like that silence!'

'Don't the gentleman know best anyhow?' replied P. 47. 'If he don't charge, we can't take her; and sure a woman's boulding her tongue is no offence!'

When the silent lady reached a certain distance, she slackened her pace, panting like a hunted deer. But there was something resolute even in her quick-drawn breaths, and her figure was still erect and her nerves strung. She had not given in. She would carry out her project, whatever it was, in spite of fortune. But, owing to her ignorance of the locality, rendered practically darker by the darkness of the evening, she had made a mistake. She had left the cab too soon: it might have taken her far nearer the scene of action, without the slightest risk of its awakening observation. Her intrepidity was not of so common a kind as might be supposed; for until now she had never in her life been in the case of an unprotected female. She had hitherto moved through the world like a queen in a play, surrounded by domestics, court, army, and preceded and followed by a flourish of trumpets. To find herself alone and on foot, wandering in the dark, and through unknown paths, stared at like a spectre by the passers-by, and hunted like a criminal by policemen—this was a situation so absolutely at variance with her rôle, that the courage which sustained her must have been something truly heroic.

But Claudia was determined, *coute qui coute*, to ascertain a certain fact; and a few words with Mr Poringer, spoken apparently at random, had shewn her that this would be easy, if she could only reach the place unobserved. She would be fooled by nobody. She would believe nothing but what was revealed to her by her own eyes. She would distrust Adolphus; she would distrust his lackey; she would distrust Miss Heavystoke; she would distrust Oaklands; she would distrust her own father. She would see, learn, know everything herself. Her visit to the family lawyer, which was on ordinary business, might have been paid at any other time, or she might have sent, more characteristically, for him to wait upon her; but she chose to go, and at an unusual hour, that her father might be from home during her absence, and that she might have an excuse for making use of a conveyance not driven or accompanied by the servants of the family. Her meeting there with Sara, and the nature of this young person's business, which she had extracted from the lawyer, gave her a sensation so new and strange that she could not analyse it. It served to fix her resolve, however, still more firmly; it elevated her courage, it gave speed to her steps, and made her feel as if every moment was precious, as if she had already lost time, as if her fate depended upon her object being attained that evening.

The adventures she encountered had been quite unforeseen; but her habitual presence of mind had been equal to the exigency. To summon the aid of the police, to complain, to utter even a word that might seem to require explanation, would have been to run the risk of public inquiry. Even to ask her way frequently, appeared to her to be dangerous to her scheme; and it was, therefore, chiefly by dint of patient prowling, that she at length succeeded in reaching the opening of Hartwell Place, the name of which she read by the light of a dull lamp at the corner. It was at this hour a singularly gloomy-looking avenue; the gardens forming one side of the way being a mass of impenetrable shadow, while the only light in the street beyond the corner where she stood was a kind of luminous haze, thrown forth apparently from a window at the further end. This shewed her that the information she had received concerning the locality was correct; and with the same deliberate and noiseless pace with which she had been accustomed to float up the long

vista of her own drawing-room, she glided on along the solitary street. The object of her journey of discovery being simply to look in for a moment at the window, we will now give the reader a peep of the interior: but in doing this, we must be permitted to proceed in our own deliberate way.

Robert Oaklands had not been idle during the long intervals of his visits to his Wearyfoot friends. A portion of the day he gave up to writing for the weekly and monthly periodicals, for he could not afford now to wait the slow movements of a quarterly; and the rest of his time he spent in inquiry and reflection on a plan he had hitherto kept to himself. His resolution, however, had that very day been taken; and in the evening, when Mr Driftwood called, he did not scruple to mention to him and Mrs Margery what he was about to do.

'You may remember, Mr Driftwood,' said he, 'that when I came to London first, in reply to your question as to how I proposed to live, I gave you a long list of my accomplishments, and you seemed to think that even a small portion of the number would suffice.'

'I think so still,' replied the artist: 'what you want is steadiness—you won't stick to a thing when you begin it. If you had followed the painting, you might have been near me by this time; and, at any rate, if you had joined me in business, as I proposed, you might have rattled off the portraits as your share of the work, while I executed gallery-pictures that would have been a fortune to us both one day.'

'Even the portraits, I fear,' said Robert, smiling, 'would have wanted the Grecianizing hand of the master!'

'So they would—I would have touched them all over after you. Come, you shall have a chance yet: take back your word, and come to Jernyn Street to-morrow.' Robert shook his head.

'Then what are you to be after? You took to the cabinet-making, not so genteel a thing as painting to be sure, but still you would have done well enough there if you had only stuck to it. But some new crotchet came in the way, and no human being could tell what you were about for ever so long. You may have been a billiard-marker for aught I know; and even that would have been more rational than hunting about, as Margery's idea was, here, there, and everywhere, after grand relations you never saw or heard tell of in your life.'

'That is all true—sit quiet, Margery, and don't mind him—but cabinet-making, you know, would never have brought me more than journeyman's wages, and I had, and have, a strong fancy for something more. Still my projects have all failed—I admit that, and it is necessary to try something new. Now, you may remember my capabilities were not bounded by painting, cabinet-making, and authorship.'

'Oh, you could do fifty other things, I know, and I saw you myself do half of them. You are a house-painter, a glazier, a carpenter, a bricklayer, a slater, and so on—but what is the use of that? Would you be more than a journeyman for the number of your trades? You could carry a hod, too, ever so high. Stuff!—If you could get up a pole one-third of the length, and stand on your head on the top of it, it would be more to the purpose.'

'Perhaps I could do even that: I shouldn't mind trying if it came to the push. But the truth is, I think it a pity that such accomplishments as these should be lost, and lost they are in an old country where all of them are separate and crowded trades. I am going to try a new field, Driftwood; yes, Margery, and one where it will go hard with me if I cannot find a lump of gold the size of an egg at least, to send home to you. This announcement excited a great commotion in the room. The artist took it upon him to be exceedingly angry with his imprudent young friend; and Mrs

Margery, so rudely awakened from her favourite dream, could hardly find voice for remonstrance.

'And just when it was all coming out,' said she, 'exactly as I told from the first! It's a flying in the face of Providence to interfere with fate, that's what it is! See if you will get as comfortable a room in these outlandish places, or as nice a bit of victuals as any lord in the land has on his plate, or a shirt more spotless than you will find in the first drawing-room in England! And see if you will get anybody to mind your little comforts—and rise before daylight to get your breakfast the first thing, so that you may not work on an empty stomach—and think nothing of anything, but thank you for it all—and feel so proud, and so happy—happy!'—and poor Margery lifted up her voice and wept.

'What he will get,' said Driftwood, sententially, 'is cold and rage, with the damp ground to lie upon; starvation if he finds no gold, and a pickaxe through his skull if he does.'

'Don't mind him, Margery,' said Robert, soothingly—'that picture is quite in the out-of-doors-style: I shall never, it is true, either abroad or at home, meet with the comfort and kindness I enjoy here; but I can rough it as well as most people, and I can work and live where men of higher talent and higher rearing would sit down and perish. As for the pickaxe, I am not sure that I shall put myself in the way of it at all—I rather think I shall not. The mines are a lottery in which there are only a few prizes to a thousand blanks; but in the midst of a population, one-half of which is an idiot, and the other half will not work at ordinary trades, there must be numerous fields of industry and ingenuity for such as I.'

Here the conversation was interrupted by a single knock at the door, and Doshy presently ushered in a female visitor, handsomely dressed in walking-costume. It was Molly; and the two Wearyfoot friends were in one another's arms in an instant, Mrs Margery weeping on her friend's bosom, and her friend, who was never behind hand on such occasions, weeping with her, and taking the cause of sorrow upon trust. Molly, after this preliminary business was over, curtsied to Robert with some awkwardness, for, like other sensitive ladies, Molly was the victim of conventionalism. She knew that it would be improper to be so familiar with a gentleman of his figure and manners, but she longed to tell him at once how sorry she was for her late ill-humour. To sit down with him like an equal was out of the question, but there was no other room in the house with a fire, which the weather rendered indispensable; so the matter was compromised by her and Doshy getting well into a corner, while Mrs Margery occupied an intermediate place between them and the gentlemen. Molly was too much astonished at the news that was speedily communicated to her in whispers by Doshy to be able quite to comprehend it at first; but she was assisted in this by recollecting the fact she had come herself to announce, that the captain and his retainers were to set out the next day on their return home. There seemed to her to be something strangely sympathetic in the two movements—the one to Australia, the other to Wearyfoot; and she took the liberty of thinking, that, for all Mrs Margery's experience, there was as much genuine fate in the one denouement as in the other. Robert received the intelligence without apparent emotion; for he got up presently, as if to fetch a book from the shelf at the further end of the room. But he did not find what he wanted; for he returned, and then went back again, and so kept wandering up and down the floor, as if he had lost himself on the Common.

'It is very easy,' said Driftwood at last—for he, too, had been in a reverie—'it is very easy to talk of going here and there—but how is it to be done? You will want money, Oaklands, money to get you an outfit, to

take you to the antipodes, to enable you to travel from the coast to the mines, and to keep you alive till your earnings begin to come in. For my own part, you see, these confounded guineas are very slow, and my gallery-pictures have not yet been found out by the connoisseurs. In another year or so I should be able to give you a cheque for a thousand easily enough, and that would insure your success; but at present, why'—

'For the present,' interrupted Robert, 'I cordially accept your good wishes instead. A smaller sum than you mention would indeed make the adventure easy, and expedite my return, perhaps by many years; but talking of that is of no use—I see my way towards raising by and by what is actually necessary, and hard work, perseverance, and time must do the rest. Come, instead of a thousand pounds, you shall give me a couple of your spare brushes, Driftwood; and I will take as much care of them as I did of the cake Molly made for me at my first exodus from the Lodge. I kept that cake, Molly, for months, and it did me more good than any cake I ever ate before or since.' This made Molly burst into a nervous laugh that ended in a gush of tears—with which she half-drowned a little girl who had the mishap to enter the room at the moment.

This little girl was followed by two little boys. They were the children of a poor widow who lived in the upper part of the house, and were in the frequent habit of receiving lessons in reading from Robert in the evening when he was at home, besides a good hunch of bread and butter from Mrs Margery. The little creatures were very poorly dressed, but clean and tidy, and had been so kindly treated by their hosts that they felt and behaved as if they were members of the family. Robert had already one of the boys by his knee, with the lesson-book open on the table; another was climbing into Mrs Margery's lap; and the girl was struggling to get away from Molly, whose intentions she was not altogether sure of—when that young lady let her go suddenly, head over heels upon the floor, and gave a loud scream.

Margery flew to her friend, and Robert and Driftwood likewise rose hastily. Molly, however, answered not a word to their questions, but sat staring at the window, with her round eyes dilated even beyond their usual size, and absolutely blazing with astonishment. There was nothing at the window to account for her scream. If the evening had not been so dark, it might have been supposed that the waving of the trees in the gardens opposite had excited her imagination; for Mrs Margery had been in the habit at Wearyfoot of dispensing with shutters, the kitchen windows opening into the garden, and her present abode being the last house in the row, and there being no passage beyond, she still kept up the custom.

'What ever is the matter with you, Molly?' said Mrs Margery; 'have you lost your senses since you came to London?' At the moment a carriage chanced to pass the end of the street.

'There—there!' cried Molly; 'I knew I could not be mistaken! It's a face nobody could mistake who had once seen it, and it was lighted with two eyes that were like gas jets looking in at the window!'

'Is it a spirit you fancy you have seen?' asked Driftwood.

'O no, sir; I know better than that—a spirit doesn't go off in a carriage, but in a flash of brimstone! Though it was like a spirit too; for its black mourning-dress seemed only a piece of the black night; its black hood was raised over its brow that it might stare in upon us the better, and so the lighted face looked as if it was floating in the air.'

'Molly,' said Robert, earnestly, 'of whom are you talking?'

'Of Miss Falcontower.

'The girl's crazy,' cried Driftwood, indignant at having been betrayed into excitement by so palpable an absurdity.

'Did you ever see the lady,' said Robert with much vexation, 'you have so thoughtlessly named?'

'Oh, I saw her come out of her carriage, and I was told who she was.'

'That accounts for your illusion. Her face being a very remarkable one, has dwelt in your imagination; and that dark window with the panes glittering in the fitful light of the candle and the fire, has supplied you with materials for a picture.'

'Oh, that's all very well for you, Master Robert,' said Molly, somewhat sullenly; 'but for my part, I can't see nothing but what's before me; and if this was my last moment, I'm ready to make oath that what I did see was neither ghost nor picture, but Lord Luxton's daughter.'

Robert was much struck with the earnestness of this declaration. There was obviously no intentional deception on Molly's part, and the chance of her being under a delusion herself seemed at least to diminish. But how to account for the presence of that unfathomable Claudia? Could it be that the wild notions of Margery—for he now understood how these had been confounded with his apparently more tangible expectations—had reached the ears of the Falcontowers? Could it be that he himself was suspected of being at the bottom of the fraud, and that Claudia's was a visit of espial, intended to ascertain from external appearances his real position in the world? But this idea merely flitted across his mind for a moment; for how could she have known of Margery's custom—a very uncommon one in London—with regard to the window; and, ignorant of this, could it have been her intention to inquire from door to door into his circumstances? More than all, how was it possible to suppose that one with so many dependents at her command would undertake in her own person so singular a task?

To reason on the subject, however, was vain; and, taking up his hat, he proposed, as he sometimes did, to accompany Driftwood, who was now preparing to go, to the end of the street. It was arranged that the artist should have the felicity of escorting Molly home; but that young lady, saying that she would join him presently, lingered behind to bid a confidential good-by to Mrs Margery. Her friend had by this time dried her tears, or else the triumphant smiles that broke on her good-looking face had absorbed them naturally. As soon as the gentlemen were gone, she whirled Molly to a corner of the room, out of view of the window, and laying her two hands on her shoulders, and putting her mouth to her ear, said in an eager whisper—

'Don't you see, girl? Isn't it all coming out, just as I told you from the first? And isn't the denouement hastening on as fast as ever it can?'

'What's coming out?' said Molly in astonishment, 'when Master Robert is going to the other world, and Miss Sara to Wearyfoot?'

'Hush, not a word! You don't know anything about it: you are as blind as a mole, for all your great eyes. What would Miss Falcontower be doing here this blessed night, unless it was a-coming? How should you have seen her yourself prowling about, and flattening her nose, I dare be sworn, against our window, like my cousin Driftwood, as round as a crown-piece? I tell you, girl, it is as sure as fate itself—and that is seldom put out of its way, except by foolish people who don't understand it. And you will be married, Molly, out of hand; and a comfortable match you will make of it, now that the young baker has succeeded to his father; and your first girl will come up here as soon as she is old enough, and join me in the business, and have it all to herself when I am dead and gone. See if that doesn't come out too!' Mrs Margery, in the triumph of her art, would perhaps have gone on arranging, in the most

satisfactory manner, the destinies of numerous generations, but Molly was not in the vein to listen. The spectral face of Claudia was before her imagination still; and it affrighted her so much that she would fain have taken refuge in ignorance from the preternatural illumination of her friend, just as when a child she had been accustomed, from similar feelings, to hide her head in the bed-clothes.

The two ladies, however, took a loving farewell of each other, uncertain whether they were ever to meet again in this world; and Molly, with wandering steps and slow, pursued her solitary way down the dark street to join her convoy.

## SLAVERY, CANDLES, AND WAR.

A STRANGE grouping of words this! War and slavery may act and react on each other; each may produce the other; and both are bad, let them be produced how they may. But how candles can be materially affected either by slavery or war, or could act as a moving agent against those evils, is not so apparent. Nevertheless, there is an intelligible link of connection; and this connection may perchance become more intimate than it has hitherto been. The reciprocal action of war and slavery, without an intermediate agent, we will at once dismiss—it is too political a subject for these pages; but we can promise the reader that there is much that is interesting and instructive in the answers to these two questions: How may war affect candles?—and how may candles affect slavery?

How may war affect candles? By a very simple commercial operation—raising the price of tallow. We must not talk about recent news, or the Chancellor of the Exchequer will search for the penny-stamp on the corner of this sheet; but it is not venturing too boldly to state, that we are now at war with Russia. Now, Russia is our great storehouse for tallow. We kill 'beeves and muttuns' in large numbers, and these beeves and muttuns are richly supplied with fat. But still we cannot satisfy the wants of the tallow-melter: our meat-fat is good, and much of it finds its way to the spit, the oven, and the saucepan; and even if this were not the case, the manufacturing requirements for soap and candles could not thus be met. We make something like 200,000,000 lbs. of soap annually, besides a quantity of candles, the amount of which is not known, because no Excise duty is paid upon them. The home supply of fat and tallow is quite inadequate to this demand; we are beginning to receive cargoes from Australia, and we receive cargoes from countries nearer home; but those from Russia far outweigh all others. The tallow of home produce is prepared by persons called renderers; the fat and suet received from the slaughterers and butchers are chopped into pieces and boiled in water; the greater part of the fat melts out of the membranes, floats to the top, and is skimmed; another portion is squeezed out by powerful presses; and, finally, the dried and pressed membrane, under the name of 'graves,' is used as a fattening food for poultry. In Russia, the processes are analogous in principle, though differing in details. The cattle which roam over the vast steppes of Southern Russia, are driven to the *salgans*, or tallow-factories, where they are fattened for slaughter—the fat for tallow, and not the meat for food, being the main object in view. When slaughtered, a little of the offal is removed, and the rest of the carcass is cut up into pieces; these are thrown into boilers, each of which is of such monstrous size as to contain the substance of twelve or fifteen oxen. The boiling, and the skimming, and the pressing produce three or four kinds or qualities of tallow, which are packed in barrels, and sent to market. Now, of the 250,000,000 lbs. said to be annually sold by Russia to other countries, England takes so large a quantity, that any interruption

to the trade between the two countries will be seriously felt by the cattle-owners and tallow-factors of Southern Russia. We have imported in the last six years no less than 7,654,908 hundredweights of tallow from Russia, giving a yearly average of 1,275,818 hundredweights, or more than 140,000,000 lbs. If the import becomes impeded by the operations of war, we shall suffer by paying higher for our tallow, and consequently for our candles and soap; and if the impediment becomes still greater, the sellers will be nearly ruined, for they will lose for a time their best customer. It is thus that war may affect candles, by raising the price of the raw material out of which they are made.

How may candles affect slavery? This is a far more interesting question, both morally and commercially, than the one which we have just considered. In order rightly to understand it, it may be well to notice a few facts in the chemistry of candle-making.

Until within the last few years, ordinary candles were made wholly of tallow; those of better quality and higher price being made of wax and spermaceti. The tallow was melted just as it came out of the casks, and the candles were dipped or moulded with this hot material. M. Chevreul, however, an eminent French chemist, bethought him that it might be worth while to inquire a little into the chemistry of tallow, to ascertain whether the whole substance is combustible, or whether it contains anything which, by being incombustible, retards rather than assists the burning of the candle. He began his labours in 1811. In 1813, he succeeded in separating a substance which he called margaric acid, from tallow; he next separated another, the oleic acid; in 1814, he discovered a third, which he called stearic acid, or stearine. Now, he found that all these three acids, one liquid and two solid, are combustible; but that they are combined in tallow with a fourth substance, which he named glycerine, and which is incombustible. Hence came a question: whether candles would not burn better if the glycerine of the tallow were removed? Some years afterwards, Gay-Lussac proposed to Chevreul the establishment of a company, or industrial association, for the manufacture of margaric and stearic candles. Chevreul consented, and the two distinguished chemists set to work with the patent which they obtained; but chemistry and commerce are not always equally well understood by the same persons; and the company, whose formation was proposed in 1825, proved abortive. What failed to the chemists, however, bore fruit to others: M. Bonnet made 'bougies stéariques Rue de Buffon;' and MM. Milly and Motard made 'bougies de l'Etoile;' both kinds being improvements on the old tallow-candles. By 1833, the sale of the 'bougies de l'Etoile' had risen to 25,000 kilogrammes (about twenty-five tons) annually.

Here, then, was a satisfactory point attained: candles could be made with the noncombustible materials left out; and in respect to guttering, and smoking and snuffing, they were a vast improvement on the old tallow-candles. But at what price had the improvement been obtained? Ay, 'there's the rub.' It was found that five pounds of tallow were required to produce two pounds of the purified material, which raised the price of the candles to eighteen or twenty pence per pound. This would never do for general consumption. Something must be done; some new fatty substance must be discovered or thought of as a substitute for tallow. *Palm-oil* was hit upon for this purpose. Dr Hempel and Mr Blundell took out a patent, and Messrs Blundell and Spence introduced palm-oil candles—which, however, being dark in colour, never came into general use. Meanwhile, Mr Soames had taken out a patent for cocoa-nut oil candles; this patent was sold to Messrs Wilson and Lancaster, and became the groundwork of the celebrated Vauxhall establishment,

'Price's Patent Candle Company's Works.' These cocoa-nut candles required snuffing; but it was now discovered that a mixture of cocoa-nut stearine with palm-oil stearine produced a material for candles, and which yield a beautiful light, require no snuffing, and could be sold for 1s. per pound. Thus matters went on; a powerful company was formed; numerous patents were taken out by the company, and others purchased by them from other inventors; and at length matters arrived at the enormous scale on which they are now conducted at Vauxhall.

There may seem to be only little progress made yet in arriving at a solution to our question: How may candles affect slavery? But we are approaching it by very legitimate steps. The largest candle-factory in England, and probably in the world, uses *scarcely an atom of tallow*. This is a great fact. Vegetable fat is used instead of animal fat. The Vauxhall fraternity are vegetarians, in this sense. Their vegetable provender consists chiefly of cocoa-nut oil and palm-oil. These oils are very interesting in their nature, source, and mode of procuring. In Ceylon and other parts of the East, there are extensive forests and plantations of the cocoa-nut palm-tree; the trees take about ten years to arrive at maturity, and they then yield about 100 nuts yearly on an average for nearly a century. The kernel of the nut contains oil; it is first dried, after being gathered, then crushed under edge-stones, and then pressed both hot and cold; the resulting liquid is cocoa-nut oil. The other substance named above, palm-oil, differs from cocoa-nut oil in this—that while one is obtained from a kernel within the fruit, the other is obtained from a soft rind external to the fruit. The fruit is about the size of a pigeon's egg, with a golden-coloured exterior pulpy envelope. This pulp is bruised and boiled in water; a yellowish oil separates, rises to the top, and cools to the consistence of butter. The natives of Guinea collect the oil in calabashes or large gourds, and bring it down to the British factories or warehouses on the coast; they bring it as they make it, even if it be but a single pound, and barter it for articles of English manufacture.

The company's works at Vauxhall are not unknown, by reputation at least, to the readers of *Chambers's Edinburgh Journal*. In No. 446 of the Second Series, under the title of *Lights for the Night*, an account was given of the admirable schools established by the company, chiefly through the energy of Mr J. P. Wilson, for the boys and girls employed by them. These schools have become quite famous, as shewing what may be done if a commercial company will throw a little heart as well as head into their work. We notice the works now in this place, only for the sake of saying a few words concerning the employment of palm-oil and cocoa-nut oil for candles. These oils, together or separate, undergo many chemical and mechanical processes, until they present the form of pure solid stearine, or 'composite,' or 'Belmont sperm,' or one among many varieties which are adopted for different purposes. The candles are then made in moulds, none of them being 'dips' or 'store' candles. The company require thousands of tons of palm-oil annually; and as for cocoa-nut oil, they have purchased a thousand acres of cocoa-nut plantation in Ceylon, that they may be certain of a supply of material.

The subject, then, has approached this stage—that beautiful candles are now made of solid stearic acid, which burn better than those made of unpurified tallow; that palm-oil yields this stearic acid at a lower price than tallow; and that palm-oil is obtained from the very part of Africa which yields the unfortunate victims of the detestable slave-trade. Now, it has occurred to many persons that the cultivation and extension of the palm-oil trade may be made a means of lessening the slave-trade. Barbarous tribes sell their neighbours

into slavery because they can obtain a good price for them. But what if they could obtain a good price for palm-oil instead? They will then need the men at home to make the palm-oil, and will of course give up selling them into slavery.

Mr G. F. Wilson, managing director of Price's Patent Candle Company, gave a lecture before the Society of Arts in 1852 on the stearic candle manufacture, in which he drew attention to this very important question. A committee of the House of Commons examined the subject a few years ago, and obtained evidence, among other persons, from Mr Hutton, whose firm had been engaged in the African trade for more than forty years. He stated that the palm-oil trade is carried on in British vessels; that it is a barter-trade, the palm-oil being almost entirely paid for in the manufactures of Manchester, Birmingham, and Glasgow; that the trade might be very much increased gradually, but not suddenly; that it employs a very large proportion of the population of the districts where it, the oil palm-tree, is grown, in gathering, preparing, and bringing the oil down to the British factories; and that he considered it an indisputable fact, that the legitimate trade and produce of Africa are, in every respect, the most desirable means that can be applied to the suppression of the slave-trade.

Another witness examined was Mr William Jackson, well acquainted with African trade, but still better known as the chief among the energetic founders of Birkenhead. He stated that palm-oil is a produce that may be indefinitely multiplied, and that we are only in the infancy of our trade with the west coast of Africa. He states his opinion, that whatever be the demand, the supply would rise to meet it, although there may be delay in certain seasons. It appears that, until 1826, the English merchants sent out such articles as beads, small looking-glasses, and other trifles, which attracted the simple curiosity of the natives; but new tastes were acquired, and the blacks sought to obtain utilities in exchange for their palm-oil. On one occasion, Mr Jackson's firm sent out a portable house worth L.1000, to King Eaman of Old Calabar, to be paid for in palm-oil.

Captain Forbes, in his *Dahomey and the Dahomans*, written since the evidence was collected by the above committee, says that 'the inhabitants of a vast extent of coast have been led to give up the slave-trade, because they have been taught the immense increase of the value of the palm-oil trade over that in slaves;' that 'the taste for British goods runs high, and if these could not be purchased with slaves, palm-oil would be manufactured to obtain them;' that 'one-third at least of the extent of the slave-coast has been already conquered by civilisation and legal traffic, and it requires perseverance alone to reduce the remainder. All the high-roads to Central Africa, the Delta of the Niger, in which I include the Benin, the Cameroons, the Calabars, &c., have submitted to the laws of civilisation, and the inhabitants scout with disgust the idea of selling their fellow-men.'

It is said that no less than 20,000 tons of Liverpool shipping are engaged in the palm-oil trade alone. The trade has indeed become very large. In the five years, 1849 to 1853, the imports varied from 448,589 hundred-weights to 636,628 hundred-weights, being already a very important relative percentage to the imports of tallow. The African region over which the tree grows whence this palm-oil is obtained, is wide-spreading; but Dr Kehoe, an official gentleman stationed at Sierra Leone, recommends the point at which a junction is formed by the Niger and the Tchadda, as the best place for a British trading-station with the whole region, commanding, as it does, the whole internal system of water-communication. The Shea butter—a vegetable fat of rather more solid consistence than palm-oil—is produced from a tree growing in nearly the same

localities as the oil-palm; and it is conceived that the same commercial establishments which would open a trade in the one would do so in respect to the other.

After dwelling on the commercial aspects of the question, and the importance of England freeing herself somewhat from dependence on Russia for tallow, Dr Kehoe proceeds to say: 'But it is the Africans who will be chiefly benefited by our trade; and we have every rational reason to expect that, in the course of time, it will greatly check or destroy the foreign slave-trade. . . . Though it is absurd to suppose that commerce can work miracles at once, or at once stop the slave-trade, yet its tendency unquestionably is to humanise and civilise; it gives men new ideas and new wants, and causes them to exert themselves to gratify them by their own industrial efforts; we may therefore fairly hope to see, under its influence, all classes of Africans gradually improve.'

These hopes may possibly be too sanguine; but they will shew how, in many minds, there is just now a chain of connection between Russia and War, and Candles and Palm-oil and Slavery.

## PIERRE DUPONT AND HIS POETRY.

UNKNOWN and unnoticed by us, a new poet has arisen among our Parisian neighbours, who has, in seven years, attained a high degree of popularity. His name is Pierre Dupont. The advent of any writer whose words penetrate to the hearts of his countrymen, is an event worthy of attention. His utterance, though in a foreign tongue, must not pass by unheeded, for song is the common property of the world, and the true singer should be universally welcomed.

The songs of Pierre Dupont are peculiarly deserving of observation; not for their intrinsic merit, which is, however, considerable, but on account of the public feeling they embody—the political and moral sentiments they evidence, and of which Pierre Dupont is the echo.

The French nation degenerated morally under Louis-Philippe. Peace, with its economical blessings, brought many vices; and during the latter years of the monarchy, a merciless spirit of avarice pervaded all ranks of society. Head triumphed over heart, and the maxim, *enrichissez-vous*, excluded, by not including, the principles of justice. Oppression and revolution were the result. Avarice is all selfish; for, although riches may stand as a guarantee of respectability and order, there must be an end of high feeling when they are held up to a nation as the sole aim of individual exertion. At this juncture, when impulse and poetry languished, some fresh, pure, nature-loving chansons were heard for the first time at certain public and private concerts in Paris; and a volume of graceful pastoral lyrics found its way to the pianos of the *bourgeoisie*. With this volume commenced the Parisian life of Pierre Dupont.

The infancy and youth of the poet resembled that of most men who have raised themselves to celebrity. They record little incident, yet suffice to interpret the life they preceded. Domestic affections, early love, restraint, and the spirit of resistance, combined to make a poet. He was born at Lyon, the city of French industry, on the 23d of April 1821. His family were artisans; and the spectacle of constant work, of order, of the daily creation of wealth, had its effect in forming the mind of the youth. At four years of age he lost his mother, and being adopted by an aged priest, a relative, was sent, for the purpose of education, to the

religious seminary of Largentière. On leaving this establishment, he was placed in a banking-house; but his taste revolted from the dull routine of business, from the accounts, the books, the punctuality, and he shortly threw up the situation in disgust. He now first began to turn his attention to literature, and wrote his book, entitled *Les Deux Ages*.

At Provins resided a grandfather of Pierre Dupont, whom he frequently visited, and there he had the good-fortune first to meet M. Pierre Lebrun of the Academy. Through the kindness of this gentleman, a subscription was raised to defray the expenses of publication; and *Les Deux Ages* was about to be given into the hands of the printer, when the poet was drawn in the conscription, and compelled to join a regiment of hussars. Fortunately, the yet unemployed subscription remained in the hands of M. Lebrun; the fund was devoted to the purchase of a substitute; Dupont was released; and his public life, earned by the first effort of his pen, began in earnest.

A second subscription was raised, and the book published. Faulty, incomplete, undeveloped as it was, this volume obtained the prize at the Academy, and the writer received his first literary employment as an assistant in the formation of a dictionary. Dry as these labours must undoubtedly have proved, there can be no question as to their utility in establishing and augmenting his taste for rhetoric. He learned to appreciate the full meaning and value of words—to weigh the lightest shades of expression, to distinguish the brief, the true, and the comprehensive. All this is evident in his poetry. His tones have the ring of the true metal. He is neither diffuse, artificial, nor forced; he uses no long words. His lines are idiomatic, earnest, tender, brimful of straightforward feeling. His gaiety is as bright as the spring sunshine; his tears well up from the overflowings of a beating, passionate human heart. He puts the best word in the right place; and here we think he owes not a little to the drudgery of the dictionary, to the stormy Academical discussions on grammar and rhetoric, and to the lively disputes of M. Cousin with M. Victor Hugo. But soon Pierre Dupont found the Academy almost as wearisome as the banking-house. He felt that to be happy he must be entirely free, and he longed to live alone. He withdrew entirely from the employment of this institution, preserving, nevertheless, his friendship and gratitude for M. Lebrun.

His exquisite collection of songs *Les Paysans, chants rustiques*, next appeared—an elegant edition, illustrated with graceful lithographs, and clad in an appropriate cover. This venture was destined to meet with a complete success: the circles of Paris were grateful to the poet for having introduced an element of truth and nature among the frothy and artificial strains of their musical soirées. Even the fastidious *habitué* of the Italian Opera listened with unaccustomed pleasure to the mingled and various emotions which found a voice in these rustic pages; and the least enthusiastic were moved by the simple melancholy and the innocent joy of some, as well as by the hardy accents of the labouring peasantry, which were forcibly presented in others of the series. Meanwhile, advancing upon the path which seemed peculiarly to belong to his genius, Pierre Dupont wrote and composed a song which may well be deemed one of the most remarkable productions of the age, and deeply significant of the times in which it was produced. We allude to the *Chant des Ouvriers*, published in 1846. Appearing on the eve of a great revolution, conceived at a crisis most eventful in the history of nations, this song is worthy of more than ordinary consideration. It awoke an echo in the breasts of thousands; its melancholy truth, and the fitful gaiety of the refrain, more sad even than the rest, vibrated instantaneously upon the hearts of the inhabitants of a great city. At a period when the merciless greed of the few was purchased by the sufferings of the many—when the ruler

of the state, intent solely upon the aggrandisement of his own power, built higher and higher the unstable fabric which was soon to be his destruction—when the cries of suffering were changing, unheeded, into the distant murmurings of revolt, a song like this *Chant des Ouvriers* attained a superior value; it became a political omen, the type of a new thought; and the people spoke from the mouth of the poet.

The state of trade, and the condition of the French operatives six years ago, could not fail to touch the impressionable heart of a poet like Pierre Dupont. All at once, that ill-paid and unhappy multitude who were daily breathing the poisonous effluvia of mercury, white-lead, phosphorus, and other chemical ingredients—sleeping amid vermin, toiling in ateliers, and inhabiting the wretchedest quarters amongst thieves and chiffonniers—all at once this neglected class received an advocate and a poet in Pierre Dupont. His song was speedily in every mouth. Would it be too much to say, that perchance this very song may have aided to hasten the great outburst of popular feeling that ensued, and so have contributed to the downfall of the Bourbon dynasty?

Whatever may have been the results of this lyric, it has certainly obtained an immense popularity in Paris; and few persons, especially those who have been so fortunate as to hear M. Dupont himself sing those memorable verses, will readily forget the first impression thereby produced upon them. It is with extreme diffidence we venture to subjoin the following version of a poem that must unavoidably lose so much of its original fire in the process of translation as this:—

## SONG OF THE WORKMEN.

We light our lamps before the dawn of day,  
And wake from sleep at Chanticleer's first warning;  
We rise, and toiling for our scanty pay,  
Return and seek the anvil before-morning.  
Our hands, our arms, our feet for bread are sold;  
We with our bodies labour on in sorrow;  
And yet, against the pangs of wintry cold,  
Or coming age, we cannot shield to-morrow!  
Then let us love, nor pause to think,  
While still we pass the can!  
Though the cannon's sound may thunder round,  
Drink, drink—  
The liberty of Man!

'Tis our unresting arms that from the earth  
And jealous ocean wrest those hidden treasures  
Which feed with pomp the idle pride of birth,  
Rich meats and clothing, and all selfish pleasures.  
Gems, metals, diamonds, pearls from the deep,  
Fruits from the hill, corn from the level plain,  
We win for kings. We are the hapless sheep . . .  
What mantles from our wool the masters gain!  
Then let us love, &c.

And with what fruit does industry endow  
The back that bends beneath such labour mean?  
Whence rise the dews that bathe the workman's brow?  
Alas! the workman is but a machine!  
Our Babels rise to Heaven—from us her trade,  
Her wealth, her wonders, doth the world derive;  
But when the golden honey-store is made,  
The master burns the bee within the hive!  
Then let us love, &c.

Our women, placing their own babes aside,  
Take to their breasts the offspring of another;  
And he, in time, taught by ancestral pride,  
Disdains to sit beside his foster-mother.  
From day to day, as groaning France can tell,  
The master's hand weighs heavier upon her:  
Law is despotic; and our daughters sell  
To midnight revellers their tarnished honour.  
Then let us love, &c.

Arrayed in rags, and dwelling out of sight,  
Down in the cellars, up beneath the eaves,  
We live with owls and bats that love the night,  
Or crouch in gloomy holes amid the thieves.  
Meanwhile the ruddy blood leaps in our veins  
Impetuously warm, and every one  
Would fain be out upon the woody plains,  
Or basking 'neath the oak-leaves in the sun!  
Then let us love, &c.

Each time the rushing torrents of our veins  
Have flooded trembling Paris, we have bled  
To crush our tyrants and to burst our chains;  
And ne'er in vain that bloody dew was shed.  
Then mark the future—never glance behind—  
Stronger than War is Love! With song and mirth,  
Let us await the rising of that wind  
Which wafts the clemency of Heaven to earth!  
Then let us love, &c.

From this time the destiny of Dupont was decided: he had nothing to do but to press forward. To sing the joys, the griefs, the dangers of every class, to investigate all the aspects of humanity, to lighten the horizon of suffering, and to give encouragement to labour by the administration of a gentle and consoling philosophy—such were the duties that fell to the province of his muse, and these he yet continues to fulfil. The revolution of February 1848 burst upon Paris, and all the hopes and misfortunes of that movement found an echo in the poetry of Pierre Dupont. *Le Chant des Soldats*, *Le Chant des Etudiants*, and *Les Deux Compagnons du Devoir*, rang like a war-trumpet amid the ranks of the army, rousing the *ouvrier* in his workshop, and the student amid the seclusion of the schools. Still, the more tender and simple accents of rural poetry had not lost their attractions for the popular lyrist; and every now and then, in the pauses of his political labours, some rustic ballads found their way to the public ear, as refreshing amid the clang and tumult of war as the murmur of a mountain-waterfall. Among these, *Les Boeufs*, *Ma Vigne*, and *Le Noël des Paysans* may be especially indicated.

The works of Dupont divide themselves obviously into three parts—pastoral, political, and philosophical songs. The last, the most significant, perhaps, of the poet's own individuality, are enveloped in a pensive obscurity, which may be deemed either a defect or an additional charm. The secret of Dupont's philosophy is love. His intense worshipping of nature, his frank reliance upon the innate virtue of the human heart, his belief in love and truth through all the darkness of suffering and want, his trust, and his sympathy, form the great inner charm of his writings. Love is, according to his creed, the universal panacea; and even in his war-songs this gentleness and forbearance are peculiarly apparent. For instance, he has said:—

Le glaive brisera le glaive,  
Et du combat naîtra l'amour!

On reading these chansons, we find in them one all-pervading under-current of meaning, which, though not always expressed in words, is universally apparent—that chain, connecting song to song and heart to heart, is the love of humanity. We believe this principle to be a new element in French poetry; and we hail the advent of Pierre Dupont as a bright omen for the destinies of his countrymen. Already others are following in his footsteps—already a portion of his task is achieved.

Poetry is a divine and beautiful thing; and when, in a pure and noble guise, she finds her way to the workshop, the attic, the hospital, or the dungeon, who can say how blessed a revolution she may not there effect?

We will conclude with a translation of one more song, which celebrates the day set apart by the Roman

Catholic Church for prayers for the dead, under the mournful title of—

THE DAY OF THE DEAD.\*  
(LE JOUR DES MORTS).

Wifeless and childless now for thirty years  
I've dwelt alone, my home's surviving member;  
I deck my hat with cypress, wet with tears,  
When dawns the second morning of November.  
Then through the misty field and marshy dell  
I faltering walk, and never once look back,  
Pursuing to the church the tolling bell,  
Where door and shrine are draped with black.

*De profundis!*

O God, with mercy-loving hand  
Conduct my dear ones to the skies,  
And take the dead of every land  
Unto your holy Paradise!

More crowded than on Sundays, until late  
With kneeling suppliants filled, the church appears  
A widowed bride in mourning for her mate,  
Clad all in sable, gemmed with silver tears.  
Now rolling like the tempest far away,  
The organ swells, then thunders through the gloom  
Loud as the trumpet of the judgment-day. . . .  
I feel my heart oppressed as in a tomb!

*De profundis!*

O God, with mercy-loving hand  
Conduct my dear ones to the skies,  
And take the dead of every land  
Unto your holy Paradise!

Next in the grave-yard I kneel down to pray  
Upon the grass beneath the elder-trees;  
And so I pass the rest of this sad day  
With body bent—with wet and aching knees.  
Yet colder far in winter frost and snow  
Are those who lie beneath in weary beds!  
In spring 'tis better, for above them grow  
Sweet violets, and grass waves o'er their heads.

*De profundis!*

O God, with mercy-loving hand  
Conduct my dear ones to the skies,  
And take the dead of every land  
Unto your holy Paradise!

My cypress branch, keep green until the spring,  
And be not planted o'er this grave in vain—  
Keep green till blossoms grow and linnets sing!  
Farewell, my dead!—I homeward turn again.  
Now, going back, I think of glories fled;  
Of comrades long forgotten, battles won.  
They tell me now those gallant hearts are dead,  
And cold the greatest far—Napoleon!

*De profundis!*

O God, with mercy-loving hand  
Conduct my dear ones to the skies,  
And take the dead of every land,  
My friends who formed that gallant band,  
Unto your holy Paradise!

But if this hero, whom all hearts regret,  
Lies buried in fair Paris, as they say,  
I will go there when blooms the violet,  
And on his grave one parting garland lay.  
Yes, I will go before I seek that bed  
Where emperor and shepherd equal lie;  
For I, like others, must rejoin my dead,  
Since I have earned by grief the right to die!

\* A charming edition of the chants and chansons of Pierre Dupont is now publishing in Paris, at fifteen and twenty centimes the number. Each *livraison* contains an exquisite steel-engraving after Tony Johannot, Andrieux, and others, and is accompanied by a page of music giving the melody of each song, whereof Dupont is the composer.

*De profundis!*

O God, conduct with loving hand  
My wife and children to the skies,  
And take the dead of every land,  
Mine ancient friends, that gallant band,  
Unto your holy Paradise.

## THINGS AS THEY ARE IN AMERICA.

OHIO—CINCINNATI.

A HUNDRED and more years ago, when the French still possessed so large a portion of America that the English were sometimes not quite sure of being able to keep their ground against them, there stood on the sloping and woody frontier of Michigan, a pretty little French village of wooden houses, forming a post for carrying on trade with the Indians, and called Detroit, from its situation on a narrow part of the river which flows from Lake St Clair. In these quiet old French times, an occasional canoe laden with peltry was perhaps the only craft which made its appearance at the landing-place. Now, in the hands of the Anglo-Americans, we see on the spot a series of substantial quays, at which a long line of sailing and steam vessels are drawn up, and when we land in this far-inland mart of commerce, we feel very much as if amidst the bustle of a seaport.

Walking into the city, everything is indicative of change. In two or three places, you may notice dingy wooden buildings of antique construction, with verandas, in which, in the days of yore, Frenchmen in queues smoked their long pipes, and Frenchwomen knitted the family stockings—relics of the old village now all but gone, and swallowed up by tall and handsome edifices of stone and brick. The streets and avenues, broad and ornamented with trees, are thronged with business; and banks, stores, and hotels meet the eye at every turning. The situation seems to be adapted for carrying on an extensive traffic with the lakes, and being near the terminus of the Great Western Railway of Canada, it cannot fail to become an important centre of intercommunication. By taking this railway at the Falls of Niagara, passengers will run across Canada to Michigan, not only in a much shorter time than they could pursue the line along the southern shore of Lake Erie, but they will in every respect enjoy greater comfort in the transit. The Erie Railway has become notorious for disorderly conduct, and interruptions take place at different points by a change of gauge; likewise, at Cleveland, a badly-regulated ferry requires to be crossed. Already, the citizens of Detroit have expressed a wish that the mails for Michigan may be sent by the Canadian route.

At Detroit, the traveller perceives that he is on the threshold of that great west, which is now only opening up for settlement, and he can scarcely avoid hearing accounts of the marvellously rapid progress which is making in the states of Illinois, Wisconsin, and Iowa. Probably, the most surprising instance of this kind is that of Chicago, a city of Illinois, on the western shore of Lake Michigan, which was begun in 1831, and already numbers 60,000 inhabitants. A gentleman mentioned to me that, forty years ago, he could have purchased the whole ground on which the city stands for 500 dollars; now, as large a sum as 10,000 dollars for the site of a single store would not be considered extravagant. Boundless, however, as is the field for settlement in Illinois, Michigan, and other western states,

I should recommend emigrants from Europe not to attempt going beyond Canada or Ohio; either of these being sufficiently far distant, and having the advantage of being readily accessible from the Atlantic cities. The west may be best settled by American pioneers, with constitutions and habits adapted to the new regions beyond the lakes.

As the boundary between Canada and the States, the river St Clair, or Detroit, is not seen without a certain interest. From the city of Detroit, we look across to the British shore, half a mile distant, and observe that behind the frontage of wharfs forming the railway terminus, there extends the village of Windsor, with a number of pretty villas scattered about its outskirts. It will be recollected that the river at this and other points, is that eagerly sought-for line of separation, to which fugitive slaves from the south direct their flight. Having succeeded in gaining the Canadian shore, and being therefore safe from pursuit, the refugees disperse to offer their services as waiters in hotels or steamboats, or to settle down as cultivators of the soil. At a spot called Dawn, a short way within the frontier, they have established themselves in considerable numbers, and are said to be in a thriving condition.

Down the beautiful river Detroit to Lake Erie, I proceeded in one of the splendid lake-steamers, bound for Sandusky in Ohio, which was reached after a voyage of six hours. The vessel wound its way among various islands at the head of the lake; but these, level, and generally covered with trees, possessed no strikingly picturesque features. The shores of Lake Erie are for the most part of the same character; though fertile, and blessed with a fine climate, the country is tame in outline, and all that usually meets the eye is a fringe of trees overhanging the low and muddy banks. On one of the islands in the lake, a vineyard is successfully cultivated.

Sandusky, situated at the bottom of a bay on the southern shore of the lake, is another of the old French villages, expanded and modernised into an American city. From this place, I proceeded by the railway-cars to Cleveland, the line pursuing the lake-shore nearly the whole way, sometimes going across inlets, on posts sunk in the water, and at other times darting through masses of forest, amidst which were occasionally seen the log-huts and clearings of settlers. The land seemed rich, apparently a heavy alluvial deposit, fit for any kind of grain crops.

Beside me in the car there sat an aged personage of lanky appearance, with thin clean-shaved cheeks, and a broad-brimmed white hat, rather the worse for wear. He spoke continually, either in ejaculatory remarks, or in inquiries about everything. The car had just got under-way, and all had settled in their places with the ordinary gravity of American travellers, when my neighbour began in a pretty high key, addressing nobody in particular, and pausing about a minute at the close of every sentence:—

'Well, here we are all safe, I hope . . . It's a pleasant thing to know you are going home . . . O yes! . . . Not so cold as yesterday; no . . . The train seems to be running across the lake . . . We have nothing but water on both sides . . . O, I see I was mistaken; there is a pile of lumber . . . Great lumbering trade hereabouts, I guess . . . I have been as far as Milwaukee, to see my daughter, who is settled there—she is very comfortable . . . I am going home to Boston . . . A long way that . . . But there's a fine sunset, at anyrate' . . . (Looking at me)—'How far do you go, stranger?'

'I am going to Cleveland, and then to Cincinnati.'

'O, you're travelling that way, are you? Perhaps in the dry-goods line?'

'No. I am not travelling for business; only making an excursion to see some of the more interesting places in America.'

'Why, sure! You are from the old country, I guess.'

Well, now, that is strange. What part of England are you from?' 'I am from Scotland.'

'Are you? Well, we've no want of Scotch in the States; they're a 'cute set of chaps—well posted up on most things. I suppose you're married . . . You might be at anyrate' . . . (Here he again began to maunder, speaking straightforward to the atmosphere.) 'Well, well, marriage is a proper thing; no doubt . . . I have seen a good deal in my time . . . Just before leaving home, I received a letter from a niece in New York, inviting me to her wedding . . . I sent word, that I wished her and her proposed husband much happiness; and the only advice I could give them, was to mind themselves, and take charge of their own babies . . . Yes, yes, a strange world this . . . Many people think they have nothing else to do, but make a present of children to uncles and grandfathers, as if they had not had enough to do looking after their own. . . Won't do, no how, for me, *that*' . . . (Conductor goes through the car.) 'I say, conductor, are we in the right track? . . . This the way to Cleveland? . . . When do we change? . . . O ay, yes, yes, all right; I thought so . . . A man can't help being anxious . . . I am going home . . . Ah, it's a long way . . . But I can sleep in the cars . . . Of course I can . . . I always carry a cap in the crown of my hat . . . Nothing like taking little luggage . . . And so you are from the old country? . . . Yes, yes, you have plenty to see . . . I declare it's getting quite dark . . . Well, I daresay we'll get to Cleveland in good time.' And so on he went with little intermission to the end of the journey. 'I see,' said he, 'they're slowing the train . . . There's the engineer's bell . . . We shall stop in a minute.'

And true enough, the train drew up. The passengers hurried out, and walking down an inclined platform, reached the bank of a river, and placed themselves upon what seemed a raft, without railing or guard of any kind along the sides. As it was exceedingly dark, I cannot venture on a description of this extraordinary ferry-boat, which crossed the Cuyahoga river with the passengers and their baggage in a manner by no means pleasant. Several times, in passing under the mooring-lines of steam-vessels, we were told to duck down our heads, to avoid being swept from the unprotected deck; and at these times, while there was a general prostration, might be heard the eccentric Bostonian speaking to himself aloud: 'Ay, ay, one does meet sometimes with curious things . . . I hope the rope won't take off my hat . . . I felt it graze on my back just now . . . I am glad we are now near the other side . . . There's a man with a lantern . . . I think I see the omnibus . . . Well, I'm thankful it's all over.' 'And so am I,' said another of the passengers. 'It's the last time in my mortal existence they catch me on them tracks any more.'

Amidst these audible mutterings, the ferry-boat touched the quay; and in the scramble which ensued, I saw and heard no more of my loquacious fellow-traveller—the only person, by the way, of an inquisitive and prattling turn of mind whom it was my fortune to encounter, and probably one of the few survivors of that by-gone class of characters supposed to be peculiar to America. In the present day, so far as I could see, the people of the United States have too much to do to mind anybody or anything further than what concerns themselves; and so far from troubling you with questions, they are absolutely indifferent as to who or what you are, and let you go your way in peace.

In arriving at Cleveland, I had come upon the great thoroughfare of emigrants between New York and the valleys of the Ohio and Mississippi—the point where they turn off from the lake-shore road towards Cincinnati. On getting to the railway-station, a scene of prodigious confusion presented itself. Some hundreds of Germans and Irish of both sexes were seen bivouacked

beside vast piles of trunks and bags. Some had lost sight of their baggage, and ran frantically about looking for it everywhere, at the risk of being run over by locomotives. In proportion as the cars filled, the hubbub gradually lessened; and at length, after securing my seat, the train set off with its immense freight of passengers, most of whom were in quest of a home in the New World. The journey occupied about twelve hours, and was latterly through one of the finest parts of the state of Ohio—namely, the valley of the Miami, which, with rich sloping fields, and bounded by picturesque woody hills, presents a variety of landscapes, such as are seen in the more beautiful parts of England. Falling into the Ohio, the Miami River, in its descent of 150 miles, affords valuable water-power for numerous manufactures; while the valley through which it flows admits of a canal being carried from the Ohio to Lake Erie; and thus the district is the great channel of communication for traffic between the lake countries and the Southern States.

It was about nine o'clock on a bright sunny morning, that, coming down the valley of the Miami in the cars, I first saw the Ohio, a river of large volume, but, from a long-continued drought, much smaller now than usual, and with steep sloping muddy banks on both sides, surmounted by green hills, here and there dotted with the white mansions of a settled and thriving population. Turning down the valley of the Ohio, close under the high grounds, Cincinnati, the Queen City of the West, was revealed in all her beauty, seated on terraces amidst picturesque knolls on the right bank of the Ohio, and looking complacently across the broad river towards the garden-like lands of Kentucky. Settled for a few days at the Burnet House, one of the largest and best-conducted hotels in the United States—and more like a palace than a house of public entertainment—I had time to make myself acquainted with some of the more remarkable features of this extraordinary city and its neighbourhood, as well as to hear something of Ohio and its adaptation for emigrant settlers.

When speaking of the rapid advance of civilisation westwards, Cincinnati is usually referred to as affording the most striking instance of progressive increase, not only as regards population, but manufactures, commerce, and every attribute of refinement. The mind can hardly realise the fact, that till 1788, or just sixty-six years ago, there was not an Anglo-American settlement in Ohio; and that the only whites were a handful of French fur-traders on the borders of Lake Erie. What is now the population of this magnificent state? Upwards of 2,000,000! Its metropolis, Cincinnati, was in 1800 only a village of 750 inhabitants—in 1850, its population was 115,000; and many thousands of fresh settlers are added every year. We do not, however, observe any rawness in the appearance of the place. Fronting the Ohio, there is a long quay lined with substantial though not very regular buildings, and from this exterior quarter, thronged with shipping, streets ascend to the higher grounds, and are intersected by others at right angles. The houses are, for the most part, built of a reddish-coloured sandstone, tall, massive, and crowded with stores and business offices—every floor, in some instances, to the height of six stories, being a different concern. Several streets are lined in the American fashion with trees; and at intervals we come upon churches of tasteful architecture, with spires shooting up above the tallest buildings. One peculiar feature is everywhere observable—the number of sign-boards in German. This language is seen inscribed on doorways, and so frequently heard spoken, that one almost feels as if he were in Hamburg. Of the entire population, 51,000 are foreigners, of whom 30,000 are Germans, 13,000 Irish, and 3600 English. The number of Scotch is singularly small, being only 771. This scarcity of an element generally

found wherever there is any prospect of well-doing, is probably to be accounted for by the absorption of Scotch emigrants in Canada, and the states immediately west of it. While Ohio has been strangely neglected by settlers from Great Britain, it has become a land of promise to Germans, who, fleeing from the dull despotisms of central Europe, find here a boundless scope for their genius and persevering industry. They find, likewise, a region resembling that of their own dear Rhine—a country of corn and grapes, rich in every valuable product, and possessing those genial seasonal influences which clothe the earth in flowers.

Placed on the Ohio, 1600 miles from the ocean, steamers are seen at the quay of Cincinnati, taking on board freight and passengers for New Orleans, and all other places of importance on the Mississippi, and its larger tributaries. Vessels of less burden proceed up the Ohio to Wheeling and Pittsburg, whence there is now a communication by railway with Philadelphia and Baltimore; and keeping in recollection the ready access by railway and canal to Cleveland, on Lake Erie, it will be seen that Cincinnati is the centre of a circle which bears on the Atlantic in the east, the vast prairies on the west, the lake countries on the north, and the Gulf of Mexico on the south. It is only by a perception of this wide and comprehensive radius, with its enormous and ever-accumulating demand for products of mechanical industry, that we can understand the character of those manufacturing establishments which are making Cincinnati one of the wonders of the new world—and which, after all, are nothing to what they must ultimately become when the population of the great West is consolidated.

When one thinks of a carpenter's shop, he has probably in his mind two or three rude-looking apartments, with at the most a dozen men in paper-caps working at benches with planes and chisels, or leaning over a plank with a hand-saw; or with experience a little more extended, he may perhaps get the length of fancying a cabinet-making establishment with fifty picked hands, turning out several handsome pieces of furniture daily. The idea of a factory as large as a Lancashire cotton-mill for making chairs, tables, or bedsteads by machinery, would hardly present itself to his imagination. Yet, it is on this factory-mill system that we find house-furniture produced in Cincinnati. Curious to see such places, I spent a day in rambling about the outskirts of the city, where manufactories of various kinds are conducted upon a scale that went very far beyond my previous notions of what can be done by machinery.

The first establishment I visited was the furniture-factory of Mitchell and Rammelsberg—a huge brick building, five stories in height, with a long frontage at the corner of two streets, and in which 250 hands are employed in different departments. Many of these are occupied merely in guiding and superintending machines moved by shafts and belts from a large steam-engine on the ground-floor. Every article receives its shape in the rough, by means of saws; and these move with such rapidity, that their teeth are invisible to the eye. The articles are next planed, or turned, and morticed, in the same inconceivably rapid manner. In the planing operations, some surprising effects are produced. A rough deal, or other piece of wood, being arranged on a bench under the action of a plane which revolved horizontally, was in a few instants smoothed as if by the finest hand-labour. Chairs of a common class, but neatly turned and painted, were the principal article of manufacture. The number produced almost goes beyond belief. I was informed that the average quantity was 200 dozen every week, or at the rate of 124,800 chairs per annum, worth from five to twenty-four dollars per dozen. Among these, a large number are rockers. The machinery for scooping out and shaping the seats was exceedingly ingenious. The

next article in importance is chests of drawers, of which 2000 are manufactured annually. Baby-cribs are another important item; but the number of them produced could not be definitely stated. Much of the lighter kinds of work, such as painting and varnishing, is done by boys, who make from four to eight dollars each in weekly wages. Many of the workmen—all being on piece-work—realise twelve dollars per week; but some have even higher wages. My attention was called towards the process of ornamental hand-turning, chiefly executed by Germans. One of these clever mechanics went through his work with astonishing speed and precision; his keen eye never being for one instant raised from the whirling lathe before him. This person, I was told, made eighteen dollars per week, and being a sober, well-behaved man, he had already realised property to the value of 5000 dollars (L.1000 sterling). Many other workmen in the establishment were spoken of as having accumulated property by their industry and economical mode of living. The most steady hands were stated to be native Americans or Germans. 'English and Scotch were good workmen, but not usually well educated, or of sober habits.' I heard the same thing said elsewhere.

The next establishment I looked in upon was Mudge's bedstead-factory, in which similarly improved machinery was employed to cut out and finish various parts of the articles required. As many as 1000 bedsteads are turned out every week, valued at from four to twenty-four dollars each. Some other works were visited, but it is undesirable to enter on details respecting their products. In the fabrication of iron stoves, locks, and hinges, window-frames, ornamental cabinet-ware, upholstery, firearms, hats, boots and shoes, machinery, axes and other edge-tools, carriages and numerous other things—the operations were on a similarly gigantic scale. In one of the boot-and-shoe factories, there are wrought up annually 10,000 sides of sole-leather, 40,000 sides of upper leather, 20,000 sheep-skins, 2500 calf-skins, 5000 poundweights of boot-nails, and 600 bushels of shoe-pegs. The wages paid away in this establishment amount to 60,000 dollars per annum. On hearing facts of this kind, the question continually occurs: Where do all these manufactures go? Of course the explanation is found in the perpetual demand over the vast regions of which, as has been said, Cincinnati is the centre. Every day, thousands of fresh families are making a settlement in the wilderness, and each needs bedsteads, tables, chairs, and other articles of domestic use. On the quay at Cincinnati, therefore, you see vast piles of new furniture, iron stoves, tinware, cases of boots and shoes, and everything else needed by settlers, preparing to be despatched a thousand miles by steamers on the Mississippi and its tributaries. One manufacturer of cabinet-work told me he had received an order to make the whole furniture of a hotel in California!

Like all travellers from England who visit the factories of the United States, I was struck with the originality of many of the mechanical contrivances which came under my notice in Cincinnati. Under the enlightenment of universal education, and the impulse of a great and growing demand, the American mind would seem to be ever on the rack of invention to discover fresh applications of inanimate power. Almost everywhere may be seen something new in the arts. As regards carpentry-machinery, one of the heads of an establishment said, with some confidence, that the Americans were fifty years in advance of Great Britain. Possibly, this was too bold an assertion; but it must be admitted that all kinds of American cutting-tools are of a superior description, and it is very desirable that they should be examined in a candid spirit by English manufacturers. In mill-machinery, the Americans have effected some surprising improvements. At the machine-manufactory of Messrs Burrows, of Cincinnati,

is shewn an article to which I may draw the attention of English country-gentlemen. It is a portable flour-mill, occupying a cube of only four feet, and yet, by means of various adaptations, capable of grinding, with a power of three horses, from fourteen to sixteen bushels per hour; the flour produced being of so superior a quality, that it has carried off various prizes at the agricultural shows. With a mill of this kind, attached to the ordinary thrashing-machines, any farmer could probably grind his own wheat, and be able to send it to market as finely dressed as if it came from a professed miller. As many as 500 of these portable and cheap mills are disposed of every year by the Messrs Burrows; and they are seen at work all over the southern and western states. Surely it would be worth while for English agricultural societies to procure specimens of these mills, as well as of farm-implements generally, from America—a little of the money usually devoted to the over-fattening of oxen would not, I think, be ill employed for such a purpose.

In some of the wholesale stores of Cincinnati, articles of English manufacture are kept; and the imports of foreign liquors and luxuries of the table seemed to be considerable. On the whole, however, it was pretty evident here, as at other places, that the Americans aim at independence in every branch of trade; and indeed they can scarcely avoid doing so; for the drawing of supplies of so vast a nature as they require from distant nations is totally out of the question. Besides, here is every raw material on the spot. Iron, wood, and coal, and other grand necessities of manufacture, are at hand in inexhaustible abundance. The coal-fields of Pennsylvania, on which are based the prosperous iron-foundries and engineering establishments of Pittsburg, are, from their extent, a kind of geological marvel, and render this great country independent of the pits of Durham and Northumberland.

The most curious thing of all about Cincinnati, is its system of pig-killing and pork-pickling. The place is known as the principal hog-market in the United States. The hogs are reared in the country around on the refuse of the corn-fields after harvest, and among the extensive forests, where they pick up food at little or no cost to their owners. Brought in steamers from a great distance, they are seen marching and grunting in large herds through the streets to the slaughtering establishments in the neighbourhood. The season in which they begin to make their appearance is the fall, when they are in prime condition, and when, from the state of the temperature, their carcasses can soon be cooled by the air, and rendered fit for pickling. The greater number of the hog slaughter-houses are behind the town, on the road towards the higher grounds, and are generally wooden structures of a very plain description. Each is provided with a series of pens, whence the animals walk in single file along an enclosed gallery towards the apartment where they meet their doom.

When a pig is killed in England, the sufferer usually takes care to let the whole neighbourhood hear of the transaction. On such occasions, it is the prescriptive right of the pig to squeak, and he is allowed to squeak accordingly. In Cincinnati, there is no time for this. Impelled along the passage from the exterior pen, each hog on entering the chamber of death receives a blow with a mallet on the forehead, which deprives him of consciousness and motion. The next instant he is bled to death; and by means of an extensive system of caldrons and other requisites, the carcass is speedily cleaned, dressed, and hung up to undergo the proper cooling, previous to being cut in pieces and pickled. The largest of these establishments is situated in Covington, on the opposite side of the Ohio, and consists of a series of brick buildings, which cover nearly two acres. Here an inclined plane leads from the ground to the top of a house four stories high, and along this the hogs are driven to an upper floor to be

slaughtered, and where as many as 4000 can be accommodated at a time. The processes of cleansing, making lard, and so forth, need no description. In most cases, the business of curing pork is separate from that of slaughtering; but here they are united; and the arrangements for cutting up, pickling, barrelling, and branding, are all on a vast scale. An idea of the work gone through is obtained from the single fact, that the pickling takes place by steeping in nine brick-built tanks, each of which holds 400 barrels of pork. Upwards of 12,000 hogs and 8000 oxen are killed, pickled, and packed here in a season. Altogether, about half a million of hogs are so disposed of per annum in Cincinnati; but the number varies according to circumstances; and questions as to the extent of the 'hog crop,' are as gravely discussed as the crop of wheat or Indian corn. Much of the export of pork is to the European markets.

Something more may be said of the Queen City of the West—what concerns her literary and educational establishments not having yet been touched on—but this may be left for the commencement of next chapter. W. C.

### SOMETHING NEW ABOUT THE AURORA.

To say that attempts have long and often been made to explain the cause of the aurora, is not new; but it will be new to many readers to hear that progress has been made in reasoning about this interesting phenomenon, as well as in the demonstration of facts less difficult of proof. According to theorists, the cause was to be found in certain effects of refraction, or antagonisms of cloud strata, or the presence of metal in a gaseous form in the atmosphere, or to cold, or to electricity; while others regarded it as cosmical—belonging to remote space. Among so many explanations, which was the true one? This was a question not easy to decide, and so savans have gone on experimenting and speculating with praiseworthy diligence and curiosity, for the one as well as the other is essential to the progress of science.

Professor de la Rive, of Geneva, is one of the few who have made the aurora a special object of study. Nearly twenty years ago, he suggested that to one and the same cause was due the origin of hail, of electricity, of the variations of the magnetic needle, and of the aurora; and he now finds himself in a position to state, that the view then put forth has been confirmed by all subsequent observations. As chroniclers of the advance of science, we think we may worthily offer a brief outline of his theory, as developed by him in the *Bibliothèque Universelle de Genève*.

Let us premise that an aurora borealis is always preceded by the formation of a sort of vaporous veil on the horizon, which rises slowly to a height of from 4 to 10 degrees. Presently, that portion of the sky which is in the magnetic meridian of the place of observation, begins to darken with a brownish hue passing into violet, and embracing the segment of a circle. The edge of this segment is bordered by a luminous arc of brilliant white light, that sometimes quivers and dances, and appears in a strange kind of effervescence for hours together. A play of colours, through every tint, from the darkest to the lightest, with bewildering rapidity, long streamers flash upwards to the zenith, and a sea of flame, traversed by dark rays, floods the northern sky. Then at that spot to which the magnetic needle points, the rays curve together, and form what is called the crown of the aurora. This result is, however, rare: when it does take place, it always announces the conclusion of the phenomenon. The vivid colours and undulations disappear, and soon nothing but a few pale ashen gray clouds are seen in the heavens.

These appearances, which are familiar to many

persons, are attended by certain remarkable phenomena: a crepitating noise, for example, not unlike the rapid flutter of a distant sail, which has been popularly described as the noise made by the petticoats of the merry dancers; and this sound is accompanied by a peculiar sulphurous odour. Positive electricity, too, has at such times been found in the air; the direction of the magnetic needle undergoes perturbations more or less intense, and so unfailingly, that M. Arago, when pursuing his researches in the lower vaults of the observatory at Paris, could always announce the appearance of the aurora in our hemisphere from the movements of his needles. During an aurora in November 1848, the instruments of the electric-telegraph between Florence and Pisa were as strongly magnetised as though the batteries—which was not the case—had been in action. The compasses of ships at sea have been at times so disturbed by the aurora, that the vessels steered a false route; and the error was only detected after the phenomenon passed away.

We thus see a very intimate relation between the aurora and certain magnetic or electrical effects; and now we may proceed to M. de la Rive's theory. The atmosphere, he says, in its normal state is constantly charged with a considerable quantity of positive electricity, which increases in proportion to the height; while the earth, on the contrary, is charged with negative electricity. Between these two, a process of recombination or neutralisation takes place; most frequently by the humidity of the air; at times, by the fall of rain or snow; and less frequently by thunder-storms and water-spouts, which, in a very-energetic form, exhibit the tendency of these two accumulated electricities to unite. The winds serve also to mingle them, wafting the positive to the negative, and the reverse.

It has been proved that the earth is an almost perfect electric conductor, and that it is constantly traversed by electric currents. According to M. de la Rive, these currents are produced by the positive electricity of the atmosphere which enters the earth at either pole, because those points being always covered by condensed vapours, present the best conducting medium. This is the normal process for establishing an equilibrium between the two electricities; the intense electrical discharges which take place, particularly within the tropics, constitute the variable or accidental process.

It is at the poles that the great electrical discharge takes place. 'This discharge,' says M. de la Rive, 'when it has a certain degree of intensity, will be luminous, especially if, as is nearly always the case near the poles, and sometimes in the higher regions of the atmosphere, it meet on its way with those extremely tenuous frozen particles out of which the loftier clouds and mists are formed.' Of the existence of these particles, and in inconceivable numbers, there is no sort of doubt. In the balloon ascent of Barral and Bixio at Paris, in 1850, the aéronauts found themselves on a sudden, although the sky was cloudless, in the midst of a thin transparent haze, which was alone produced by needles of ice so small as to be scarcely visible. Lunar halos, rain and snow, almost invariably precede an aurora; it is to the presence of these needles that the halos are due, and the rain and snow to their condensation of aqueous vapours. They form also the auroral veil, through which, owing to their tenuity, the stars are visible.

From simultaneous observations made by observers forty or fifty miles apart, the parallax of the aurora has been ascertained, and its height above the earth determined. This ranges from six to ten miles; the phenomenon, therefore, takes place within the limits of our atmosphere. With respect to the auroral arch, there is reason to believe it to be a luminous ring, with its centre at the northern magnetic pole, and cutting the magnetic meridians, which converge towards that pole, at right angles. Hence it is that the apparent summit

of the arch always appears to be in the magnetic meridian of the place of observation. The arch, moreover, is supposed to have a sort of rotary movement from west to east, which is precisely what might be predicated from the course of the electrical current.

The nearer we approach the pole, the more frequent are auroræ; and as the appearances take place in all northerly latitudes, it sometimes happens that the observer is surrounded by the auroral matter escaping from the earth, and he then hears the fluttering or rustling noise which has been alluded to. It is only when too distant that the noise is not heard. On this point, M. de la Rive speaks positively. He considers the cause to be 'the action of a powerful magnetic pole on luminous electric jets closely surrounding it;' and by means of an ingenious apparatus, he has succeeded in producing a similar noise with attendant phenomena. The sulphurous odour proceeds, as in thunder-storms, from the conversion of the oxygen of the air into ozone, by the passage of electric discharges. Like the noise, however, the odour can only be perceived by an observer situated in the midst of the auroral matter.

It is well known, that in some of our arctic expeditions which might be considered most favourably situated for observation, no movement of the magnetic needle has been seen to accompany the aurora. The reason is, as M. de la Rive explains, that those high latitudes are inside the circle described by the aurora around the magnetic pole, and are not under the influence of the electric currents which circulate outside of it, but neither below nor above, as demonstrated by observation.

The aurora is of daily occurrence, and sometimes actually takes place while the sun shines; but it is of very variable intensity. May, June, and July are the months of fewest appearances; March, September, and October of the most; the latter because the auroræ are strongest at the equinoxes, especially the autumnal. The number actually observed in a year varies from 200 to 300.

A striking fact remains to be noticed; it is one that appears completely to identify the aurora with other electrical phenomena: the auroral light is not polarised, neither is there any trace of polarisation in the light obtained from electricity by artificial means. No better proof of the identity of the two classes of phenomena could perhaps be furnished.

We have mentioned an ingenious apparatus contrived by M. de la Rive. With this, he brings his theory to the test of experiment, and, as we believe, makes out his case. It consists of a glass globe, in which is inserted an isolated bar of soft iron, bearing a copper ring, which communicates by a wire with the conductor of an electrical-machine. On exhausting the air within the globe, and exciting the electricity, all the luminous phenomena of the natural aurora are produced around the ring and the bar.

#### A SIGHT OF PAUL JONES.

After dinner, walked out with Captains Jones and Landais, to see Jones's marines, dressed in the English uniform, red and white; a number of very active and clever sergeants and corporals are employed to teach them the exercise, and manœuvres, and marches, &c.; after which, Jones came on board our ship. This is the most ambitious and intriguing officer in the American navy. Jones has art and secrecy, and aspires very high. You see the character of the man in his uniform, and that of his officers and marines, variant from the uniforms established by Congress—golden buttonholes for himself, two epaulettes—marines in red and white, instead of green. Eccentricities and irregularities are to be expected from him. They are in his character, they are visible in his eyes. His voice is soft, and still, and small; his eye has keenness, and wildness, and softness in it.—*President Adams.*

## BURYING-PLACES OF POETS.

Chancer was buried in the cloisters of Westminster Abbey, *without* the building, but removed to the south aisle in 1555: Spenser lies near him. Beaumont, Drayton, Cowley, Denham, Dryden, Rowe, Addison, Prior, Congreve, Gay, Johnson, Sheridan, and Campbell, all lie within Westminster Abbey. Shakespeare, as every one knows, was buried in the chancel of the church at Stratford, where there is a monument to his memory. Chapman and Shirley are buried in St Giles's-in-the-Fields; Marlowe, in the church-yard of St Paul's, Deptford; Fletcher and Massinger, in the church-yard of St Saviour's, Southwark; Dr Donne, in Old St Paul's; Edmund Waller, in Beaconsfield church-yard; Milton, in the church-yard of St Giles's, Cripplegate; Butler, in the church-yard of St Paul's, Covent Garden; Otway, no one knows where; Garth, in the church at Harrow; Pope, in the church at Twickenham; Swift, in St Patrick's, Dublin; Savage, in the church-yard of St Peter's, Bristol; Parnell, at Chester, where he died on his way to Dublin; Dr Young, at Walwyn, in Hertfordshire, of which place he was the rector; Thomson, in the church-yard at Richmond, in Surrey; Collins, in St Andrew's Church at Chichester; Gray, in the church-yard of Stoke Pogis, where he conceived his *Elegy*; Goldsmith, in the church-yard of the Temple Church; Falconer, at sea, 'with all ocean for his grave'; Churchill, in the church-yard of St Martin's, Dover; Cowper, in the church at Dereham; Chatterton, in a church-yard belonging to the parish of St Andrew's, Holborn; Burns, in St Michael's church-yard, Dumfries; Byron, in the church at Hucknall, near Newstead; Crabbe, at Trowbridge; Coleridge, in the church at Highgate; Sir Walter Scott, in Dryburgh Abbey; Southey, in Crossthwaite Church, near Keswick; Shelley, 'beneath one of the antique weed-grown towers surrounding ancient Rome'; and Keats beside him, 'under the pyramid which is the tomb of Cestius.'—*Barker's Wensleydale*.

## NIGHT-SCENE.

The night was closing in apace; even the hum of busy insect life was dying away. Long streaks of orange and purple shewed where the sun was sinking into his glorious repose; while the topmost branches of the forest-trees were still surrounded with a halo of light, against which the dark bed of foliage stood forth in relief as in a golden frame; the ripple of the burn, as it murmured amongst the pebbles, appeared to grow louder with the stillness of evening; the good-night of each peasant rung on the air like heartfelt blessings; it seemed that the flowers exhaled a richer perfume; that the night-breeze was more soothing than in the daytime. It is said of the blind, that deeper and keener perceptions are bestowed upon them to compensate to them for deprivation of sight, so on the night doth it seem that nature sheds sweeter and gentler blessings of repose and stillness, to compensate it for the absence of the glorious light.—*Cochrane's Florence the Beautiful*.

## HOW INDIA-RUBBER SHOES ARE MADE.

Contrary to the general impression, India-rubber, in the process of manufacturing, is not melted, but is passed through heated iron rollers, the heaviest of which weigh twenty tons, and thus worked or kneaded, as dough is at a bakery. The rubber is nearly all procured from the mouth of the Amazon, in Brazil, to which point it is sent from the interior. Its form, upon arrival, is generally that of a jug or pouch, as the natives use clay-moulds of that shape, which they repeatedly dip into the liquid caoutchouc, until a coating of the desired thickness accumulates, when the clay is broken and emptied out. The rubber, after being washed, chopped fine, and rolled to a putty-like consistency, is mixed with a compound of metallic substances, principally white-lead and sulphur, to give it body or firmness. Those sheets designed for the soles of shoes are passed under rollers having a diamond-figured surface. From these the soles are cut by hand, and the several pieces required to perfect the shoe are put together by females on a last. The natural adhesion of the rubber joins the seams. The shoes are next varnished and baked in an oven capable of

holding about 2000 pair, and heated to about 300 degrees, where they remain seven or eight hours. This is called the 'vulcanising' process, by which the rubber is hardened. A large quantity of cotton cloth and cotton flannel is used to line shoes, and is applied to the surface of the rubber while it is yet in sheets. Not a particle of any of these materials is lost. The scraps of rubber are remelted, and the bits of cloth are chopped up with a small quantity of rubber, and rolled out into a substance resembling pasteboard, to form the inner sole. The profits of this business have been somewhat curtailed of late by the prevailing high price of rubber, which has varied within a year from twenty to sixty cents per pound. The demand, however, is very large. A species of rubber-shoe lined with flannel, is extensively used in some parts of the country as a substitute for the leathern-shoe.—*New York Journal of Commerce*.

## SCENERY OF THE COAST OF THE BLACK SEA.

I forbear giving way to descriptions that could say nothing of the glorious natural spectacles which the coast, beheld from out at sea, afforded in luxurious abundance. The foaming breakers, the rocky banks, the impenetrable woods, losing themselves in endless distance; the ranges of hills, with their many tints and leafy crowns; and behind them all the great mountain-chain, with its incessantly shifting play of colours. Here, unless a perfectly serene day, such as April seldom offers, secures a clear and steady view, all is continual change. A dense mist concealing all things, is often drawn before the peering eye; and vainly does the baffled sense then seek for a relieving point of vision; until a sun-glance rends the ashen veil, and a shining beam, like a golden magic-wand, charms into sight a world of beauty; and wood, hill, and glacier are gleaming in new splendour around.—*Bodenstedt's Thunesen and One Days in the Morning Land*.

## SYRIAN NOTIONS OF MEDICAL SKILL.

A doctor is thought nothing of here unless he resorts to violent remedies. I was told a curious anecdote of a *mid-disant* doctor, who acquired a great reputation in Belian. He was much given to administering emetics, and having a very delicate patient, resorted as usual to this method of cure, leaving in the hands of the patient's brother three strong doses of emetic, which he directed should be administered at intervals of three hours. The brother, finding the first powder had no immediate effect, gave the unfortunate invalid the remaining two within five minutes. The result was violent sickness, succeeded by spasms and cramp, which in a few hours terminated fatally. Next day, the doctor was astonished to learn, on inquiry, that his patient was dead, and evinced his concern in his face. 'Never mind,' said the brother; 'it was so fated; but, *Mashallah*! you are a great doctor: the medicine you gave never ceased operating till the moment of my brother's death. It was a fine medicine, and if it couldn't cure him, nothing earthly could.'—*Neale's Eight Years in Syria*.

## PURSUIT OF THE FINE ARTS UNDER DIFFICULTIES.

The prisoners are allowed to be seen by no one, but some of the cells are exhibited. One of these I particularly noticed, the walls of which were really beautifully painted by a man who had been in prison for five years before he came here. He stayed and decorated his cell here for another five years, and when discharged he commenced stealing again, and in less than two months was condemned to two years in another prison. He decorated the walls of that cell in a most elaborate manner, and is now in Baltimore Jail for another theft, and has begun his old pursuit, which, as he has some ten years to stay, will result in some grand master-piece in the fresco style. This odd talented creature is a German, and extracts his colours from the yarns given out to him for weaving.—*Transatlantic Rambles*.

Printed and Published by W. and R. CHAMBERS, 3 Bride's Passage, Fleet Street, LONDON, and 239 High Street, EDINBURGH. Also sold by J. McGLASHAN, 50 Upper Sackville Street, DUBLIN, and all Booksellers.

## CHRISTMAS-DAY ON THE NILE.

THE voyage up the Nile from Alexandria or Cairo to the Cataracts has now become as common as the Rhine-trip was some years ago. The regularity and dryness of the climate have induced many London physicians to send patients there who suffer from chest complaints: the number of such travellers in pursuit of health is, accordingly, becoming greater every year. The East India Company allow their officers on leave of absence to remain on full pay while they are in Egypt; so, many of the heroes of Scinde and the Sutlej, of Cabool and Afghanistan, taking advantage of the permission, meet friends from England, and enjoy a three months' holiday on the Nile. A supply of antiquaries is never wanting, where every mound conceals a buried town, and every hillside is excavated by tombs filled with the remains of the past. Many enthusiastic clergy also are yearly found treading in the track of Moses and the Israelites. Many a sportsman takes a Nile boat, in order to try his rifle and his skill on a crocodile. Many an artist may be found undertaking the same journey, to sketch the various costumes of the people, the scenes on the river, the busy streets of Cairo, the mosque and the minaret, the majestic columns of Karnac, and the mud-hut of the peasant surrounded by its palm-grove: past and present alike suit his purpose. Then we have the author in various shapes, from the lady who writes letters not intended for the post-office, but honestly directed to her publisher, and the gentleman whose notes are never intended for publication, but are brought to light at the earnest solicitation of too partial friends, to the diligent investigator of the secrets of history or the marvels of ancient art; such as Lepsius and Sir Gardner Wilkinson. Nor are lady-travellers wanting. In one boat may be seen the fair blue-eyed daughter of a remote Scotch village, who has followed her husband from Calcutta to the Indus, who has lived the life of camps, but not lost an iota of her feminine gentleness, and now supports the feeble steps of him whose strength has fallen before the climate which the slender girl has withstood. In another, a widow is alone with her only son, hoping to obtain for him the health everybody but herself can see will never return. Further on, are the daughters of an English noble, who have left the many enjoyments of home-life without a sigh, to tend a sick mother and an aged father; not only enduring what are privations with cheerfulness, but even finding in them in so good a cause—the kind friends and successful rivals of the artist and the author—the consolation of all that is graceful in manner and intent. This is no fancy picture. Many

who not long ago passed a winter on the Nile will remember for many a day the harmonious voice which gave additional charm to a conversation where the object of each was the pleasure of making others happy. They will remember the cheerful affability, the natural, unforced politeness, and the frank kindness of some who perchance may read this paper, and be reminded by it of Christmas on the Nile.

When the incentives to travel are so numerous, and it is known that security to person and property is as effectually secured from the Mediterranean to the confines of Abyssinia, as from Charing Cross to Temple Bar, no one will wonder when we state that every winter about sixty boats are hired from Cairo and Alexandria, by English travellers only, for the Nile-trip. On a certain day towards the close of December, fifteen of these boats were assembled at Thebes; most of them were lying close to the village of Luxor, but two or three were on the opposite side near Gournou. It was agreed, however, on Christmas-eve, that all should meet next morning, and spend the day and dine together as best they could, in memory of Old England. The assemblage was a peculiar one. Some were on their way towards the Cataracts, others returning. Messrs Brown, Jones, and Robinson, having hired a boat together, had hurried up to the second cataract without waiting to see anything on their way, intending to visit the lions on returning; but they had been delayed by contrary winds, were tired of each other, and bored by the whole affair. They were now hurrying back to get letters; and although Brown thought he might be laughed at in England if he had not seen Karnac, after going so far to do so, and had therefore smoked a cigar among the ruins, yet he would not go to the Tombs of the Kings; and Jones and Robinson, hearing that there were plenty of snipe in a marsh near Medinet Habou, went off with their guns, and returned in great glee with a contribution of twenty couple of birds to the Christmas-dinner, far better satisfied with themselves than if they had been 'dawdling about old walls.'

Mr Spooner, and a German doctor who was travelling with him, went off with a gentleman in green spectacles, who measured the height, length, and breadth of all the largest stones; while the doctor instructed the lady in the language of the Egyptians, and made sketches of her seated on her donkey, with the most charming little rows of lace round the frilled edges of the inexpressibles which ladies who ride donkeys in Egypt do well to wear. The Rev. Thomas Grindler, who was coaching three pale and hopeful youths for their 'little go,' and farmed them for the trip, rode about expounding the wonders of nature and art to his half-starved pedestrian pupils. Sir Charles Gaunt, a gay old beau about town,

was travelling that he might have something to talk about at London dinners from April to August, and was improving his time by flirting most desperately with the smiling young wife of an old, sour East Indian, who had lost his liver in some Bengal jungle. A handsome young naval officer, in the last stage of consumption, whose mother, with all the beautiful hopefulness of a mother's love, had left husband and home to tend and comfort her son in his search after health, had just received news of his promotion, and, while the flush of death sat on his cheek, was busy with hopes and plans of still further advancement in his noble service.

We need not portray our Nile party further than to state, that all the above, with sundry others in shooting-jackets and wide-awakes—some with a turban round a straw-hat, others with an umbrella—a small proportion of ladies in cloaks and hoods—a number of sketch-books—a photographic machine—a whole herd of donkeys and their drivers, with guides and interpreters, formed an assemblage which would have mightily astonished Pharaoh, had he risen up among the ruins of his palace. It was indeed a curious sight. Among the vast remains of the stupendous works destroyed 3000 years ago, and after 3000 years of ruin and successive spoliation still remaining the grandest monuments of ancient art in the world, wandered the sons and daughters of the island whose power and dominion is greater and more extended than ever was that of Egypt, Greece, or Rome. Here, upon the fallen fragment of the colossal statue of an Egyptian king, sat an English girl, shading her fair face from the sun with a parasol made in London, sketching the remains of the once proud sovereign, for the edification of her maiden aunts as they sat over their tea in Little Pedlington; there, astride upon a sphinx, dreaming of some 'capital run' in Leicestershire, sat Brown, quietly basking in the sun, and perfuming the air with his Havannah; a little further on, a half-naked Arab was uncorking a bottle of Bass's Pale Ale, which our friend the Indian was taking instead of an antibilious pill; then followed a merry party on donkeys, trotting off to the Colossi. The English newspapers up to the 12th of November, just arrived from Cairo, took more than their share of attention from the hieroglyphics. Sheshonk led into captivity with his Hebrew subjects, sunk into insignificance beside the last accounts of the Mannings; and the efforts of the Protectionist party excited almost as much interest as the struggles of Miss Snowdrop to free herself from her fallen donkey.

The day was spent in sight-seeing; and a glorious day it was for the purpose—a bright sun, a clear sky, and a fresh breeze—perhaps a trifle too warm in the sun, and rather too cool in the shade for the invalid or the fastidious, but thoroughly enjoyable, and in most striking contrast with the frost and snow which make an English fireside the type of all comfort at Christmas.

There was far too much to see for one day. A volume might easily be written about what the different members of the English party who met that day at dinner had seen in their morning rambles. The said dinner was a rare one. None of the boats was large enough to hold the whole party, so an extempore tent was fitted up on the bank, near the water's edge. A number of oars were driven into the sandy soil, and to them the sails of the boats were attached. A lofty pole in the centre supported the canvas roof. Tables were joined together—chairs contributed from different boats—table-cloths, knives and forks, glasses, &c., were collected in the same manner; and the service, if not uniform, was tolerably complete. There were one or two little mishaps. Some of the cooks had quarrelled; and one, according to the custom of the country, had nearly succeeded in strangling another by twisting his turban round his neck. A tin case of turtle-soup, which Sir

Charles brought from his stores for the express purpose of delighting Mrs Jamieson, when opened and served up, proved to be more odoriferous than palatable. For the first time, Sir Charles thought Mrs Jamieson's smile unpleasant. Some English roast-beef, also in tin cases, was a failure; but the mutton and fowls of the country, the mock-turtle, made of pigeons by an Arab cook, the omelettes and the mishmish (or apricots and rice), to say nothing of the plum-pudding, were all perfect in their way, and formed as good a dinner as any epicure could desire. The conversation was an odd mixture of Old England and Ancient Egypt, toasts to absent friends, and compliments to new acquaintances. One was full of his morning-visit to the Tombs of the Kings, enraged at the depredations of Lepsius, who had carried off twelve shiploads of sculptured stones, and damaged ten times the quantity he could not carry away. One friend discoursed in most poetical style upon the narrow gorge or deep valley, the 'valley of the shadow of death,' in the rocky sides of which these sepulchral galleries are excavated. The long low entrance-galleries, the descending staircases, and the great halls with the painted walls and the huge sarcophagi, were all subjects for declamation. The painted figures of the different races of people known to the Egyptians, the endless processions, the figures of men and women engaged in all the concerns of daily life, from birth to death, as fresh in colour and distinct in outline as when painted more than 3000 years ago, brought before us the manners and customs of the people who built the temples and palaces we had been visiting—the concerns of indoor-life, the pursuits of agriculture, the ceremonies of the court and the altar, the offerings to the king and to the gods, the chase and the amusements, the rewards and punishments, the birth, marriage, and death, and the judgment of the soul after death, forming a pictorial history of Egypt which 'he who runs may read.'

A large party had also been the round on the western bank, from the temple-palace at Gournou to that at Medinet Habou, including the Memnonium and the two seated colossi of the plain. There is little to see at Gournou, beyond the portico of the temple-palace, which is a long row of simple columns in the form of stalks of water-plants tied together near the top, and a central hall sixty feet in length, supported by six columns. The whole building, indeed nearly all the buildings about Thebes, are of a sort of freestone very much like our Bath-stone. A walk of about a mile along the edge between the desert and the cultivated land, brings us to the Memnonium or Remeseum, one of the most beautiful monuments of Egyptian art. There still remains a central hall 100 feet by 133, with twelve massive columns, 21 feet in circumference, along its centre, and eighteen on either side, 18 feet in circumference—making forty-eight columns supporting a flat solid roof, studded with stars, on a ground which still preserves its blue colour. The walls are covered with sculpture of curious battle-scenes—the chariots and the horsemen, the suppliant and the captive, the siege and the retreat, all being so graphically represented that they might serve for illustrations to a new Egyptian Iliad.

The colossal statue of Rhamses is overthrown, and many parts are destroyed. It was the largest in Egypt, and is computed to have weighed 887 tons. Very near, sit the two colossal statues of the plain—the vocal Memnon and his companion. Some of our English friends visited them at sunrise, to satisfy themselves whether any sound could be heard from this wonder of the ancients. The height of these statues is 60 feet. The pedestal of that of Memnon is covered with inscriptions in Greek and Latin of those who heard the sound at sunrise; among others, that of the Emperor Hadrian. Various explanations have been given of this sound, and there can be no doubt that it

was some natural phenomenon, which ceased when the statue, which had been overthrown by Cambyse, was repaired by Septimius Severus. It was heard before the mutilation as well as after it, as is fully proved by many ancient authors, but no authentic instance can be found after the repair.

We might talk for hours of the great temple at Medinet Habou, and the battle-scenes on its walls, of the statues, obelisk, and temple at Luxor, and of the far-famed Hall of Columns at Karnac, 170 feet by 829. This is the great sight of Egypt, and with its central avenue of twelve columns, 66 feet high and 12 in diameter, with one hundred and twenty-two, 42 feet high and 9 in diameter, is grand beyond description. When it is known that all these columns are covered with painted sculptures, that the outer surrounding walls are also filled with hieroglyphic inscriptions and sculptured battle-pieces, our readers may be inclined to think that Brown, who spent Christmas-day smoking his cigar among them, spent it better than Jones and Robinson, who preferred snipe-shooting. Those who ate the snipe, however, did not think so at the time, and gave the sportsmen a parting cheer, as their boat was swept towards Old England by the downward stream and a light breeze, soon after the dinner-party had separated to their respective boats. Some who read this paper will well remember that day; and amid the festivities of the London season this year, will think of the deep-blue starry sky, and the clear fresh air of Egypt—will hear again the monotonous chant of the boatmen—will remember the palm-grove and the watch-fire, the filling sail and the ripple of the stream, and will shed a tear over the memory of some now gone, with whom they spent their first and last Christmas-day on the Nile.

#### THE SICK-NURSE AND THE SICK-ROOM.

WERE we to take a census of the female population of England, which should include all individuals between the ages of fifteen years and fifty who considered themselves entitled to be reckoned amongst the genteel classes of society, and from that census were to arrange in two columns, on the one hand the names of all who could play tolerably well on some instrument, and had a fair knowledge of French, German, or Italian; who could dance, dress tastefully, and were competent to take a share in the entertainment of an evening-party; and on the other were to place the names of those who well understood the humbler arts of managing a household; directing the conduct of their servants; controlling family expenditure; and last, though by no means least, that important duty of nursing and comforting the sick, and shedding sunlight over the chamber of the invalid—how lamentably small would be the number of those whose place was in this latter column in comparison with those who made a good figure in the former!

It is not that we would by any means discourage our countrywomen from the pursuit of those branches of study we have named, or from that of any others which would conduce to the cultivation of their minds and talents, or give them pleasant occupation for a leisure hour. We do not desire to see the daughters of our land return to the habits of ancient days, when to superintend the labours of the still-room, the kitchen, and the embroidery-frame, alternated with repeating *Aves* and *Credos*, and dressing the wounds of captive knights—nor would we have them like the modern Berezovian women of whom we are told in that amusing work, *Revelations of Siberia by a Banished Lady*: “The culinary art constitutes the principal branch of

education among the fair sex, and far from blushing when detected in this employment, they pride themselves on their proficiency in it as the highest of female accomplishments.’ This would certainly a little exceed our wishes; but we do not perceive why an art so very important to household comfort should be wholly neglected. It would be amusing to observe what would be the effects of a law enforcing ‘that no lady under the grade of the titled aristocracy should be permitted to enter into the matrimonial state until she had creditably passed such an examination as should satisfy competent authorities that she possessed a sufficient degree of knowledge in all points connected with household economy, to entitle her to a certificate of her capability “of discreetly conducting a family, and directing its management in the parlour, the kitchen, and the nursery.”’ Under such a regulation, how busy would the young ladies be in studying the art of cookery; and if, in addition, the following Berezovian rule were adopted in our land, how eagerly would their fair hands dabble amongst flour and butter, preserves and pickles! The rule to which we allude is, that ‘every young bride on her arrival at her husband’s house must invite guests to a dinner *prepared by her own hands*, and this repast is considered as a test of the education she has received at her parents’ house. Shame and disgrace are the consequences should she be found deficient on such an occasion, and shame also to the parents who did not attend to that essential branch of her education.’ But this is not what we desire. We would not thus occupy the whole of a woman’s time; but we would have every female well consider whether in making a good knowledge of modern languages, or a skilful performance on the harp or piano, the first object, or even the second in her children’s education, she is doing her duty: whether she is leading them to fulfil the object of family relationships and social bonds.

It is no new remark amongst thinking people, that to attach an undue value to the elegances of education is an error at present but too prevalent in all classes of society; and it is a fact which daily presses itself on our notice, that the young females in most families, however competent they may be to amuse a gay circle by their well-cultivated talents and highly-informed minds, are sadly deficient in the details of common life: needle-work is neglected, a knowledge of housekeeping undervalued, whilst even the humblest degree of insight into the practice of cookery is absolutely scouted. As to the art of nursing the sick, it is one so absolutely unknown to young ladies, that though the loving daughter or sister may evidently desire to take the charge of her suffering relatives’ comfort, she sorrowfully feels that none of her early instructions or habits have tended to prepare her for this, the dearest task of women; and she withdraws from the effort, seeing that the hired nurse, or the lowest servant in the household, performs those coveted duties more quietly and satisfactorily to the poor sufferers than herself, inexperienced and untaught as she is.

There are more qualifications requisite to the formation of the character of a good nurse than would at first sight be supposed. Patience, firmness, self-denial, all are important graces for her to possess who would fill that office well; but there are several other requisites. Sound judgment and delicate tact are most valuable adjuncts, and a quiet, cheerful spirit is inestimable both to the patient and the nurse herself.

Everything about a sick-room should wear an air of cheerful repose. In what degree the appearance of cheerfulness should prevail must depend on the nature of the patient's case; but that bright fairy should always be there, and ready to display herself when permitted; for although the acuteness of disease may be such as to require that an extreme of quietude and stillness should reign throughout the apartment and over all around it, yet lugubrious faces and dismal tones are never welcome to a sick person, and are more likely to distress and injure him than even an undue amount of gaiety. With a view to this most desirable end, 'cheerful repose,' be very careful that the chamber over which you, in your capacity of nurse, are to rule, shall always present as much as is possible of a pleasant and comfortable aspect. Never allow any cups, basins, or other relics of meals, to remain in the chamber. A sick-room, littered with such utensils, with an unswept hearth, and a couch or bed disarranged and untidy, is an unpleasant spectacle to every one, and tends to anything but cheerfulness.

How different is our feeling on entering a room where, if in winter, we see a clear bright fire burning in the grate; or in summer, an open window and a vase of fresh flowers, a table with a little work, and a few books, together with clean linen on the bed, and unsullied purity around, all indicating that a watchful eye and a friendly hand has been there—from that which we experience when dirty cups and jugs, a dusty hearth, and an array of medicine-bottles and powder-papers meet our eye, and tell of nothing but sickness and neglect. We have spoken of flowers in the sick-chamber, and it is well that they should be there; for nothing gives so cheerful and lifelike an aspect to a room as a glass of bright and well-arranged flowers; but it must be only during the day they should be suffered there. By day, flowers are wholesome and cheering friends, but at night they are deadly enemies; and for this reason: during the hours in which light prevails, all vegetables throw out that gas so highly important to animal life—oxygen, and absorb that of which an undue amount is most deleterious—carbonic acid. Under these circumstances, they are friends; but in the hours when darkness reigns, then they reverse the order they have before observed, and absorb from the atmosphere the oxygen, returning to it the carbon. For this reason, no flowers or growing-plants should ever be kept in a sleeping-room at night, but more especially in one where an invalid reposes. No very lusciously scented blossoms, however, should at any time be allowed a place in the sick-chamber. Jasmines, lilies, heliotropes, and others, which exhale a heavy and rich fragrance, must, alas! be excluded; but carnations, geraniums, a rose or two, mignonette, and other aromatic scented flowers, will afford a safe enjoyment, and acting as a reminder of God's beautiful creation in the garden and the field, will supply to the poor sufferer a fund of wholesome and refreshing thought. But they should be daily renewed, and not even allowed to stand long in the same water, as—especially in hot weather—the stems are apt to induce putridity and an offensive smell, which must of course be injurious.

A constant systematic attention to the management of light, temperature, ventilation, sound, and motion, are all important to the comfort and wellbeing of your charge. As much light as the patient can bear without a feeling of distress, should always be admitted into a sick-room. Doubtless, when the eye or the brain is affected, this will be but little: in such cases, the medical attendant will of course dictate; but in ordinary cases, light is beneficial, not only as adding to the cheerful appearance of the room, but as a chemical agent in purifying the atmosphere, and restoring it to a healthy state. Care should, nevertheless, be taken that no overbright light, either reflected or otherwise, should

be allowed to fall either on the eyes of the patient, or on any lustrous object within his sight, as that is sure to annoy. A candle inadvertently set down so that its rays may be reflected by a mirror or any other shining object within his range of vision, will be as likely to disturb a sick person as the sight of the candle itself. A similar degree of precaution should be used lest flickering lights from the fire should harass him.

A careful watch should be kept also over the temperature and the ventilation of a sick-chamber. An overheated room, or one in which the air has been allowed to become stagnant and loaded, is more injurious to the sensitive invalid than can well be conceived. Sixty degrees of Fahrenheit seems the highest standard of heat suitable for most invalids. There should always be either a fire or an open window or door, so that the air may be frequently changed in the room; yet great care should be taken that the patient is not exposed to draughts of cold air. A little management will easily effect this in most chambers; but if the weather or other cause should render it undesirable to keep either door or window open for any length of time together, one or other of them may be set a little ajar for a few minutes once in two or three hours, which will effect your purpose.

With regard to sound, you can scarcely be too careful—we do not mean that unbroken silence and stillness should be observed: this may be needful in some cases, but ordinarily it would be undesirable, and would prove oppressive to the patient. A nurse who possesses the charm of a serene and mild countenance, a cheering smile, and a soft clear voice, is always the most welcome in a sick-room. You should never whisper either to the patient or to any one in the room; but always draw near to the person you are addressing, so as to be easily heard, and speak in a distinct and audible, though low-toned voice; and having asked a question, give your full attention to the reply, so that you may catch the meaning at once, and then act, if possible, without further interlocation.

Avoid all irritating noises, and especially eschew silk gowns which rustle, and shoes which creak or tap the ground in walking: we have known a person ill with fever rendered delirious by the former cause, and rave of nothing but his nurse's silk gown for hours. Never make a bustle in the room. If you have occasion to call on an attendant to arrange any matters in the apartment, always give your directions out of hearing of its inmate, and then guide your assistant in performing your wishes by signs and single words rather than prolonged directions. Nothing worries more than the shaking of curtains, and knocking about of pans and brushes, that sometimes accompany a 'putting to rights.' If you take charge at night, or if your patient is nervous and sensitive of sound, have a cloth on your table, so that no clatter of putting down scissors, snuffers, or other articles, may assail his ears or break his slumbers. But one of the greatest triumphs of a skillful nurse is to manage her fire noiselessly, so as to supply it with fuel and keep it alive and bright. It is quite possible to do this, and to maintain a good fire throughout the night without making any sound that would awake the lightest sleeper—we have ourselves often achieved this feat, and consider it one that reflects more credit on us than most things in which we have been concerned. But to compass this end, a lady must stoop very low indeed! even so low as to condescend to lift every bit of the coal with her own delicate fingers, and with them to push the jetty lumps into the place in the fire where their presence is most needed. She may put on gloves if she pleases—and certainly she will be wise to do so; but if she wishes to be successful in keeping in her fire quietly, she must utterly ignore the existence of those noisy implements, the tongs and shovel. But how is she to stir the fire? how to clear the lower bar from the

ashes? Easily enough: the poker must share the banishment of its confrères, the tongs and shovel, and a stiff stick become its substitute. With this, and a good supply of patience, she will do very well. Insert the said stick slowly and softly into the best place for lifting your fire, then very, very gently, and very, very slowly insinuate it further, and press it further down, and so by slow degrees raise the fuel, and give it the necessary movement. After a time repeat the process in another part; but all must be done with as much caution as an Indian bheel would use in carrying off a booty which lay under his sleeping master's pillow. So to manage matters may take you perhaps a quarter of an hour, whilst one good emphatic stir would do the work in a second of time; yet you may account your quarter of an hour well spent if it avails to preserve to you that precious friend and companion a fire, without subjecting your charge to a rude and hasty awakening. You should scatter some ashes on the hearth and inner bed of the fender, so that cinders and ashes which may fall may make no noise to disturb the sleeper; and whilst speaking of the management of this important functionary, the fire, a recipe for keeping it alive during a long night, when none is watching over it, may not be ill-placed. Get a clear, bright bit of fire in your grate, not more than half filling it; on the top of this lay some small lumps of coal in a moderately thick layer, and thereon place a layer of equal thickness of damp deal saw-dust; above this, a few bits of stick, and bank up the whole at the top with a thickish layer of damp small coal. The fire will penetrate the lumps, and stop and smoulder in the saw-dust. The sticks are not expected to burn during the night, but to get dry and hot, and be in a state for speedy ignition when pushed in between the bars in the morning. A fire thus managed will keep in for twelve hours or more without overheating the room or expending fuel, and afford, at the last, sufficient materials for making a good fire in an instant. If you are preparing to keep watch at night, be careful to have everything you are likely to want brought on a tray at once, and placed within your reach, so that you may be able readily to supply any little nourishment or medicine to your patient comfortably and without noise.

Your movements in a sick-chamber must be in a great degree regulated by the character of the illness of the person over whom you are watching. There are, no doubt, occasions where a stealthy step, and slow, cautious movement are essential; but unless in cases of emergency, a free and natural action is in general better—care, of course, being taken that no sudden or impetuous movements should startle and annoy a sensitive invalid. It would seem a reasonable and common-sense rule, that the less a sick person is reminded, by external circumstances, of his state, the more hope there will be of his mind and spirits being kept in a healthy condition; and therefore it is better to keep off everything that is found to annoy, so far as it may be practicable to do so, and to preserve in his rooms as much as possible a *natural* tone and aspect.

The guardians of the sick should at all times be very cautious not unnecessarily to instil into their patient's mind any thoughts of an anxious or an alarming character. Never repeat any sad stories or startling reports, nor induce suspicious or uneasy thoughts relative to the conduct of any of the servants, children, or other members of the family. Be at all times careful, both in conversation and in selecting subjects for reading, not to bring forward anything of a too exciting nature, avoiding all harrowing tales and terrifying newspaper statements. Be watchful, also, never to fatigue your patient's mind by exercising it on too argumentative or difficult subjects. You must not gauge the mind of an invalid by its measure when the body was in a more healthy state; for the mind that is

when depressed by sickness, as incapable of it as the lowered and attenuated body of a sick man is of using the athletic exercises in which, in a state of greater vigour, he may have excelled; and, on the same principle, never dispute with a sick person any point which it is possible, with propriety, to yield, for the spirits—perhaps the temper—become irritable from indisposition.

The clear and practical knowledge of some of the simpler branches of the art of cookery which we have before advocated, is essential for a good nurse. We have seen food presented to the sick such as it was impossible for them to eat, and which was of course rejected with disgust, when neither patient nor nurse was aware that its disagreeable appearance or smell was merely an accident arising from bad cookery, and not an essential feature in the article itself.

And now let us say a few words that may aid in regulating the conduct of an ardent young nurse, and pilot her away from those rocks on which she will be but too likely—as we ourselves, alas! have done—needlessly to make shipwreck of her own health. It will seem strange to some if we say that a very refined sort of selfishness is at the root of much of the excess in nursing which we sometimes see injuring the health and paling the countenance of the loving wife or child who has the charge of nursing an invalid during a time of severe and prolonged illness. She cannot bear the pain of feeling that she is missed, and still less does she like that another should take her place, and perform for the beloved one those little offices which it is her delight to consider as peculiarly her own; and therefore, in despite of remonstrances, in defiance of warnings given her in the form of exhaustion of mind and body, she persists in standing at her post by the sick-bed, taking too much on her, declining rest when, without injury to her patient, she might properly take it; refusing to take a sufficient degree of nourishment, and perhaps pressing on in her self-imposed labours many hours together without any food, and also secluding herself wholly from air and exercise, which she needs, and ought to obtain; and thus she goes on sometimes for weeks and months together, obtaining praise for self-sacrifice, when, in fact, she is rather guilty of self-indulgence. And what is the end of all this? In all probability, a sudden failure of strength arises, illness overtakes her, and she is at once withdrawn altogether from the cherished task, which, but for her wilful over-exertions, she might have retained to the last; and her illness forms a heavy additional call on the energies of an overtasked household, and a painful source of anxiety and distress to the precious object of her affections in whose service she has been working. Every nurse ought, as a matter of duty—not only to herself, but to her patient and the family of which she forms a part—carefully to guard against such want of moderation as we have named. If she sits up at night, she should seek some hours of rest during the day, *whether she likes it or not*; she should daily go into the open air, for half an hour at least; and in respect of food, as well as in every other way, should sedulously guard the health which is so highly important to the household. It is a sort of common family treasure of which she is the guardian, and if she suffers it to decay or be lost unnecessarily, she is guilty of a moral delinquency, and her family should exclude her from the post she covets until she becomes amenable to the laws of common sense and sound judgment.

Of course we are aware that there are cases in which this extreme of effort which we have been condemning is really necessary. In such, let the young nurse go forward and trust in God to preserve her, and to bless her in her work; but let her be true-hearted and faithful in deciding whether such exertions are really necessary, or whether they do not arise from some

that, although she may stand the brunt of such an unnatural state of life on one, or even more occasions, she will surely in the end be worsted if she does not listen to reason and take care, remembering that the better part of valour is discretion.

## WEARYFOOT COMMON.

### CHAPTER XIX.

#### A DOUBLE SEPARATION.

A LADY of our acquaintance used to express her surprise that it was considered indelicate or unpolite to say to anybody—more especially to one of her own sex—How old are you? and that the person so questioned should be unwilling to give a straightforward truthful reply. If I am asked, said she, how long I have resided in such a place, I do not think of evading the question, but mention the time as well as I am able; and when the inquiry relates to the number of years I may have been a denizen of this world of comings and goings, why should I feel or speak otherwise? The fair reasoner might have gone further in her philosophy of common-place. She might have said: Since this earth is but a stage on a journey taken by us all, why do we mourn when a friend reaches the goal before us? and whence is our desolateness of heart when a separation takes place for a probably shorter space, and when even in this world we have the prospect of meeting again?

Such reasonings do very well to exercise the judgment; but we question whether they have the slightest effect upon the heart. No one, for example, was better aware than Robert of the transitory nature of this mundane scene, or less inclined to wish that it were indeed an abiding-place and a continuing city; and yet the leave-taking that was before him the next morning seemed to his imagination like the rending asunder of soul and body. On his long walk to Bloomsbury his feet seemed to cling to the ground, his head hung upon his breast, and the usually vigorous and energetic young man presented a complete picture of desolation.

But the parting itself was not so bad as the anticipation, at least in its external phenomena. It never is. The very effort to conceal the feelings divides them, and the heart is shared between grief and pride, desolation and triumph.

'Well, Bob,' said the captain, when he went into the room—'you are off, I hear, for the other side of the world? I don't blame you—I did something like it myself; and you will have a better chance of getting on there than in a place like this, where people can't stir their elbows for the crowd. But as you are not going for some time yet, you will run down to Wearyfoot to bid good-by? Yes you will?' Robert shook his head. 'No? I thought so. Perhaps you are right—it's of no use. But I am not like you, full of strong young life, and I can't help feeling down in the mouth a little. I am getting an old fellow, Bob; I noticed in the glass this morning that my hair is almost white; and if it had been so ordered that you were to have been with us down yonder for a few years, till you helped to carry me quietly—and I am sure you would do it lovingly—to that lonely little Wearyfoot churchyard, where the grass grows so trimly among the white stones, and where the weary foot is indeed at rest, why?—'

'Darling uncle!' cried Sara, throwing her arms round the veteran's neck in a passion of tears. Some large

drops rolled, one after another, down the waxen cheeks of Elizabeth. Robert alone seemed unmoved; but when he spoke, his voice was constrained and husky.

'The grass in Wearyfoot church-yard,' said he, 'will, I trust, be many times alternately green and withered before you, my beloved benefactor, are carried thither. But when that does take place, my consolation will be to know, that your last moments were soothed by the cares of those you loved, and your kind true heart laid in the grave by tender hands.'

'And you, Robert?' said Elizabeth—'will not the wanderer be with us even at the end of many years?'

'The wanderer,' replied Robert, 'may by that time have found a grave himself.'

'But if not?' said Sara, almost inaudibly. Robert paused before answering, and a struggle of some kind appeared to take place in his mind. When at length he spoke, his cheek was slightly pale:

'This side of the ocean,' said he, 'I have not found fortunate—not from my very birth. Why, then, should I wish to return? I will not even suffer myself to think of the ordinary changes brought by time—of new ties, new feelings, new graves; the things and persons of the present will remain with me as they are for ever; and so I shall be able to defy the evil fortune before which I have hitherto succumbed.'

'All this means,' cried the captain, 'that you are not coming back! You are a fine fellow, Bob, and a good fellow; but I don't understand you: I never did, even when you were a boy—even when I was teaching you to fence, and when Sara was teaching you to dance. I can understand your going—that's all very right; but why not come back?—and when you know, too, that not one of us will have any pleasure in life till you do. Why, your letters from London filled up our time and our thoughts from one letter to another. Even Margery's pothooks were precious, and they did Sara so much good, that poor Molly wouldn't open them herself. Isn't it true, Sara?' Sarah did not reply; she was shaking from head to foot, and Robert determined to cut short the painful scene. A double knock at the street-door afforded him an excuse.

'There are your friends,' said he; 'I saw them pass the window. They are doubtless coming to escort you to the railway, and that will enable me to attend to some pressing business of my own. I had a thousand things to say, but they will be better said by letter—we shall have time for quite a long correspondence before my departure. Farewell!'—and he clasped the veteran's hand and covered it with fervent kisses—'may God requite you for all your goodness to the beggar and outcast!' The captain strained him in his arms for a moment, coughing savagely away some desperate sobs, and then Elizabeth threw herself upon his bosom, and wept helplessly. Sara was just vanishing at the door of the inner room; but Robert followed her, and as the visitors were at the moment announced, he shut the door after him.

'Do not part, Sara,' said he, 'without shaking hands! If you only knew the cost of this self-sacrifice!—'

'I know nothing,' said she, turning quickly round—'speak!' and she fixed her eyes eagerly on his. Another struggle seemed to take place in his mind, and this time of so terrible a nature that large drops of sweat rolled down his brow.

'I dare not,' said he at length—'Farewell!' and he released her hand. She walked silently away; and presently, the hardly audible sound of the opening and shutting of the door informed her that Robert was gone.

Robert was strong in his consciousness of rectitude. With the exception of the conflict of the last parting moment, the only temptation that had assailed him that morning was suggested by Sara's question as to his return. They were both young. Would not a few years have a fair chance of enriching him in

country where wealth is sometimes collected in a few days? This thought darted like lightning through his brain, but like lightning it vanished. To set Sara's life-long happiness at stake on the mere chance of his success—to buoy her up with a hope which was as likely to be illusive as otherwise—and lead her on from year to year in a dream, in the course of which both her cheek and heart might wither, was not to be thought of. Let the prospect be closed at once; and if love still survived, why, then, who could tell what might happen after the lapse of years?

Robert had another scene to get through that forenoon; and the one that had just closed, instead of weakening his energies, nerved him for what was to come. It was with inexpressible bitterness of spirit he took his way to Lord Luxton's house. The evening before, there were no stars visible in the heavens to consult; but he had taken counsel of the void darkness, and did not return till that began to be edged with the cold gray light of the dawn. It seemed clear to him now that the Falcontowers had been in error as to his family position; that they had considered this, however comparatively obscure, not to be such as would reflect disgrace upon them; and that, detecting the falsehood of the report that had reached them regarding his noble birth, they had determined to observe with their own eyes the true nature of his social status. From his knowledge of Claudia, he was not at all surprised that she should leave her father in the carriage at the end of the street, and come alone to the window; and perhaps, under other circumstances, it might have given him even amusement, to imagine the feelings with which the high-born and haughty slave of conventionalism must have beheld the unaccustomed scene that was then presented to her eyes. But the same meanness which could induce them to defraud the man of low birth of the fairly earned reward of the successful writer, would afflict upon him—whose interest seemed alone to be interested in the affair—the stigma of suborning others to bolster him up by means of fraud and falsehood. This he would not submit to. Instead of sending for his papers, and allowing the unfortunate connection to drop in silence, as had been his intention, he was now on his way to the house in person, to force upon Lord Luxton such explanation as he might find necessary.

The new peer and his daughter were in the library, according to their ordinary custom, conversing on their affairs. The father was sometimes a good deal puzzled by the manner of the young lady, which, always decisive, was this morning what in a man would be called stern. Her words were few, abrupt, uncompromising. She looked older. The lines of time, whose appearance she had hitherto contrived to repress, were now visible in the unusual paleness of her countenance; and her eyes, in general so lustrous, looked heavy, yet feverish, as if they had not been recently closed in sleep. Lord Luxton, who was ignorant of her evening expedition, and of the adventures which had doubtless disturbed her equanimity, supposed that Claudia permitted her mind to dwell too earnestly on the turn taken by public affairs, and he was kinder in manner than was his wont. The young lady, however, was not in the vein for anything like either pity or affection, and received such demonstrations with a coldness allied to scorn. The conversation, therefore, was not agreeable, for the subject was perplexing; the ministerial crisis becoming more critical every hour, and Lord Luxton in corresponding difficulty as to his line of action. In the midst of it the door opened, and Robert Oaklands walked into the room.

His admission was quite accidental, and yet natural. The porter, in whose capacious mind rested the fate of visitors, like other dignified functionaries was late of coming to his post—at so early an hour of the forenoon, his countenance would have been thrown away; and

the door, therefore, was opened by one of the footmen who knew Robert merely as one who was admitted as a matter of course, and allowed to find his way unannounced to the library. Both Claudia and her father had recognised his straightforward, resolute knock, to which perhaps on the present occasion his feelings added unwonted sternness. The peer made no remark, his orders, he thought, having rendered him safe from unpleasant intrusion; but the quicker ear of Claudia had caught the visitor's step, light as it was, as he approached the room, and without looking towards the door till he entered, she drew herself up, pale, cold, rigid, impassive.

A slight bend of the head received the visitor, and Lord Luxton motioned to a chair. Robert, however, remained standing behind it.

'I have called, my lord,' said he, 'in consequence of a circumstance which occurred yesterday evening, and which compels me to suppose that you labour under some mistake as to my real character. A report, I understand, reached your ears before you left town that some mystery attached to my social position, and that I was entitled to occupy much higher ground than I did. Is this the case?'

'It is.'

'It is clear, then, from the circumstance I have alluded to, and from your not putting direct questions to me upon a subject in which you appear to have felt so condescending an interest, that you supposed me to be a party in what seemed to you a fraud—probably the chief party concerned, the suborner of the false testimony you received.'

'Having made no accusation, Mr Oaklands, either direct or implied,' said the peer with dignity, 'I feel myself under no necessity of replying to the remark; more especially as it is put in a tone which gives it the form of accusation rather than defence.'

'Defence! I mean no defence, my lord, whatever. All I have to say is, that the idea, if you entertained it, is erroneous, and betrays a very mean capacity for the appreciation of character. The report originated in the enthusiasm of, I may say, natural affection, and may have received some apparent confirmation from a misconception with regard to it under which I laboured myself; for I believed the hints that were dropped respecting my approaching elevation referred to the expectations you yourself had held out to me for a very considerable time.'

'I understood, sir,' said Lord Luxton, 'that you were aware of the importance, even as regarded your own interest, of concealing those expectations till I permitted you to speak?'

'You are right; and I cannot tax myself with having betrayed them. The equivocal was caused by my supposing it to be just possible that in some moment of domestic musing an unguarded word may have dropped from me which was caught at by the ignorant affection I have referred to, and made to harmonise with its own idiosyncrasy.'

'Very well. With regard to the expectations themselves, it is necessary to be frank. Independently of the difficulties of the ministry'—

'Pardon me, my lord, I will not hear a word on that subject. I came here to place my own character in a proper point of view—I have nothing to do with yours. Having now accomplished my purpose, I will, with your permission, collect my papers, and bid you good-morning.' Robert then walked with quiet dignity into the inner-room, the scene of his long and thankless labours.

Claudia had taken no part in this conversation. She did not move; she hardly seemed to breathe; she looked like a statue, only with living eyes that were fixed upon Robert with an intensity in their gaze, which did not appear to stop at the features, but to penetrate to the very soul. When he withdrew, she

turned slowly, as if on a pivot, those strange eyes following his firm but noiseless step, and watching his calm proud bearing, till he disappeared in the study.

'I am glad we have done with him,' said her father in an under-tone; 'he is an insolent young fellow, and wants to be taken down. Don't you think so?' Claudia did not hear: she was still looking towards the study, and listening to the movements within.

'His refusing to hear my explanation is quite enough, even without the ministerial crisis: what do you say?' She said nothing—she was probably deliberating within herself as to what she should say to him. Presently he reappeared; and, with a slight bow to the two, was just leaving the library.

'Stay, Mr Oaklands,' said Claudia suddenly; 'having claimed the liberty of explanation for yourself, you have no right to deny it to others. Lord Luxton was about to explain to you, when you interrupted him, that a ministerial crisis, which occurred during our absence from town, would render it difficult, if not impossible, for him to exercise his influence in your favour to the extent he desired. But that is not all. Whatever your ideas may be on the subject, we who live in the world are obliged to conform to its laws and customs; and his lordship cannot, as an individual, even if his own wishes tended thereto, overturn the order and reasonable gradations of society. For a man of obscure family to rise gradually to distinction is nothing new in this country; but to do so suddenly, his family must be either literally obscure, kept entirely in the background, or their obscurity must be merely that of poverty, from which they may be able to rise gracefully with the man himself.'

'I quite understand,' said Robert, with a cold, half-contemptuous smile: 'his lordship fancied that connected with me there were some small faded remnants of gentility, attenuated merely through famine, which would be no great drawback to my success in life, and he therefore promised to put me in the way of fortune—for a consideration. He now finds that there is no gentility at all in the case; and although he has received the consideration, and knows that I was completely ignorant of his mental reservation, he withdraws from his promise.'

'The statement is not complete,' said Claudia, quite unmoved; 'there is unfortunately not merely no gentility, as you phrase it, but something quite the reverse—in the case of one like you, appallingly so; and this obliges him to break his promise so far, simply by destroying his freedom of action.'

'In the case of one like me! Why so, if I may presume so far?'

'Because you are not a man of society; because your family is a part of yourself; because they must rise with you, if you rise, side by side; because you would flaunt their vulgarity and ignorance in the eyes of the public; because you would endeavour to extort for them the same respect to which you were entitled yourself; and because the attempt would cover with ridicule not only you, but your supporters and everybody connected with you.'

'You speak truly,' said Robert, 'so far as mere vulgarity and ignorance are concerned; but my case is worse than you suppose.'

'Worse! Were your parents ever married?'

'Probably not.'

'Was not your mother a menial servant?'

'Worse!'

'Do not your brothers and sisters wear on their very brows the ineffaceable stamp of poverty and low nurture?'

'Worse! worse!'

'What do you mean?'

'I mean that my origin is far lower than you imagine.'

'What, then, were your parents?'

'Vagrants—beggars—probably thieves. If I have brothers and sisters, the stamp they bear may be the stamp of Cain.'

'If? Then you do not know? You have shrunk with loathing and contempt from the contamination they would have brought?'

'I did not shrink; I do not loathe or condemn. What right have I to do so? I was born one of them, and we shared alike, doubtless, in those qualities that are a part of the gift of life. In me, when we were separated by circumstances I did not seek, these qualities were developed and grew healthily; in them, they either withered in embryo or sprang up into poisonous weeds. Me this education of circumstances introduced into the library of—a right honourable; them it conducted, too probably, to the workhouse or the hulks. I may loathe and despise their crimes, but I cannot do otherwise than love the criminals; and with regard to myself, I can only reflect with gratitude and awe on the accident, so to call it—as mere an accident, madam, as that of birth!—which has enabled me, to a certain extent, to control the circumstances by which I am surrounded, and has thus raised me to the dignity and freedom of a man.'

Robert looked proudly into those wild eyes he had so often controlled before; but the blaze they now encountered was as powerful as the one it met, because sharing in its own nature. Claudia's pale cheek was overspread with a glow which entirely obliterated the faint lines of time, and restored all its radiant beauty to her countenance.

'Then you are truly,' said she, 'as I have heard, the foundling—the waif—of Wearyfoot Common! You are free to pursue your fortune in the world—to dare—to combat—to conquer it! You are alone, are you not?—alone, I say—alone!' and her figure seemed to expand, her nostrils dilated, her eyes lightened, and she looked with an aspiring and defiant gaze, as if at some object in the far distance.

'I am alone,' replied Robert, catching no inspiration from the tone—'alone! I have no blood relation that I know of on the earth; and even between the strangers to whom I owe everything and the homeless vagrant they educated into a man, there will soon roll—as soon as I can accomplish it—many thousand miles of ocean.' He spoke low and despondingly, for he felt as if the faint lone star of the Common was at the moment vanishing in the heavens; and the unequal breathing of Claudia was heard distinctly in the silence which his words seemed to mark rather than interrupt.

'But do not think,' said he, recovering—'do not think that the avowal demands your pity any more than your scorn. The world has in our day entered into a new cycle; and the weak prejudices that still linger among us owe such shadowy vitality as they possess to little more than the mean traditions and abject imitations of the novelists. The light of knowledge, which has resolved the nebulae into stars, has established the individuality of men. No longer crouching behind our ancestors, and concealing our insignificance under coats of arms, we stand forward, each according to his own lights, and look the heavens in the face. And even so are we judged by public opinion; and even so by the loftier, nobler spirits of the small fraction of the people to which such as you belong. Worth, talent, energy, are now more valuable than a whole gallery of family portraits—which serve only to afford a means of comparison. In most cases a humiliating one, between the feeble descendant and the strong ancestor. Look at us both, my lord, at this instant, and say which has the more cause for pride—I who have kept my engagement, or you who have forfeited yours?—I, who give you my time and labour as an alms, or you who pretended to purchase them?—I, the individual man destined to carve out my own fortune, or you, swathed as helplessly

and hopelessly in by-gone generations as a mummy in its folds of perfumed linen?

'As for you, Miss Falcontower, I can only lament the blindness which darkens a fine spirit, and withdraws to mean and trivial objects those noble powers that if properly directed would achieve greatness and renown. To you I owe more than the interesting study you have yourself presented: I owe the materials for large and enlightened views of a section of life which is hidden from the vulgar in myths and symbols; I owe those revealings of the social world which one like me could acquire only through the teaching of an accomplished and high-bred woman. This debt I shall probably never be able to repay; but it may chance that I shall one day make such use of what I have learned as will give you the satisfaction of knowing that your kindness and generosity have not been in vain.' Robert bowed deferentially as he concluded and withdrew.

'Insufferable insolence!' cried Lord Luxton—'Claudia'—

'Hush! hush!'

'How is it possible to do anything for this man?'

'Hush, I say, hush!' She was looking towards the door, and threw back her hair impetuously from her ears to listen the more intently. An expression of doubt, wavering, terror was in her face, as she seemed to count the receding footfalls that would have been inaudible to ears not abnormally excited. Presently this expression changed, rapidly but not instantaneously, into courage, confidence, resolve. Then a single expiration of the breath seemed to burst the chains of years, and give her impatient spirit to life and freedom; a joyful and dazzling illumination overspread her face; she bounded with the elasticity of a girl to the door, flung it wide open, tossed up her curved arms laterally to give her lungs play, and as she threw forward her chest, gave forth her magnificent voice in a long, wild, exulting cry—

'Mr Oaklands!' The house rang with the sound, which quivered with a thrill between pain and pleasure in the ears that heard it.

But it was lost to him for whom it was intended in the loud shutting of the street-door, and after a terrible moment of suspense, her high-wrought feelings collapsed, and Claudia for the first time in her life fainted, and fell senseless upon the floor.

## OCCASIONAL NOTES.

### SCHOOL DISCIPLINE.

We have always thought flagellation, as ordered by a judge, a most unjust mode of punishment, simply because there is no making sure beforehand of how severe or how light the specified number of stripes may be. An executioner of Edinburgh, in the time of George II., hit what we mean when, in answer to an inquiry on this point, he said: 'I lay on the lash according to my conscience.' Think of so much being left to the arbitrament of an executioner! The school authorities of Harrow appear to have never considered the matter in this light, for they have deputed to one set of the boys, called 'monitors,' a title to flagellate the rest, whenever they may think it necessary. In a quarrel between a monitor and another boy, the monitor has the pleasant advantage of 'whopping' his antagonist, to within an inch of the boy's life if he pleases, under colour of law, and in perfect safety from retaliation. The public, we need scarcely remark, have become aware of this curious peculiarity of the discipline of Harrow, in consequence of an instance of the use of the privilege by a certain Master Platt, in reference to a Master Stewart, who had to submit to thirty-one blows of a cane on his naked back, for

merely having had some altercation on the playground with Master Platt (in which it appears he was in the right), and whose back was consequently left in a state which called for medical care, and drew the attention of a justly indignant parent. A medical man thus described the suffering part: 'I found the whole of the back across the shoulders, from the border of the left armpit to the top of the right shoulder, *one entire mass of bruises*, the colour varying from a bright red to a deep black. There was one deeply blackened spot on the upper and broad part of the shoulder, covering a space of very nearly four inches square by measurement.' It is tolerably evident from this in what a state the 'conscience' of the flagellator had been at the time of the infliction. As to its condition afterwards, we are left in little doubt, for the young gentleman, so far from expressing any compunction, has justified himself by representing that he has known severer punishments inflicted by monitors for less offences—that is to say, Master Stewart has, after all, got less than his deserts. What a testimony to the humanity of the Harrow School discipline! And what a specimen of the sense of justice inspired into its pupils! It is to be feared that Master Platt's sentiments of conscientiousness in matters where his own interests and passions are concerned have, under such discipline, been raised to a painful pitch of intensity; and were we connected with him in any authoritative relation, we should be deeply concerned to watch over him in future years, lest this probity towards himself should lead him into more serious scrapes than the present.

Harrow is an ancient and eminent school, and such dignified establishments are usually not very open to advice. Yet it is a fact which might be worthy of the regard of Harrow, that there are other schools, and passably successful schools too, which, so far from multiplying the lashing-power in this extraordinary way, have almost abolished or dispensed with it even in the masters. It is a world of change, and, many think, of progress; and among its changes is a gradual doing away with the law of force, and a promotion of that of gentleness. It is rapidly becoming a prevalent opinion as to schools, that the necessity of force is simply in proportion to the incompetency of the teacher, and the inadequacy of the moral superintendence. The public, generally, have been startled at the barbarism—for so they term it—of the idea of allowing one set of boys to subject the rest to a cruel and degrading punishment. They feel even an injustice in the case of Platt, who is first allowed, or rather trained to, the gratification of his revengeful feelings, and then marked with a stigma for gratifying them somewhat in excess. Let Harrow lay this to heart, were it only for its own interests as a school. Assuredly, its having a few conscientious young executioners like the one now under notice, might be felt by many rational, not to say kind-hearted parents, as something of an objection to contributing fresh pupils to the establishment.

### UNITED ASSURANCE AND GUARANTEE.

In conducting life-assurance business, it is always important to hold out the prospect of additions, or bonuses, from accumulating surplus of funds, as it feeds hope, and thus proves an inducement to the virtuous act of insuring upon life. In the cognate business of probity-assurance, or *public guarantee*, it is, we understand, felt as a discouragement, that the

annual premiums are wholly, as it were, lost money. A clerk who may have paid five pounds a year to guarantee his intrusions to his employers to the amount of £1,000, feels at the end of fifteen years that he is minus not much less, perhaps, than a year's income, with nothing to shew for it. On this account, the security of friends and relatives is still clung to by many in preference, though there can be no doubt that it is a great hardship to individuals to be subjected to such risk, when a public company can satisfy the needs of the case equally well. To obviate this objection, Mr James Knight has suggested and advocated a plan for absorbing guarantee in a connection with life-assurance; and a company of respectable means, and under excellent auspices, has been started for carrying the idea into effect. As an original conception aiming at a social improvement, we deem it worthy of notice. For a sum just about the same as that commonly exacted in many old life-assurance offices, £500 will be insured upon the life, and half that sum as guarantee for fidelity in trust—this for the first five years; after which a lower sum is demanded, being that solely required for the life-policy, it being considered that the value of the life-policy is then sufficient for the guarantee, the more particularly as it is covenanted that, in the event of infidelity to trust, the life-policy is forfeited. At the same time, the holder of the policy, if he remains so a sufficient time, becomes entitled to share in the 'profits'—that is, surpluses—of the concern. Seeing that the taking of a life-assurance policy is in itself so laudable and proper a step for nearly all sorts of persons, the effecting of guarantee, with *that* in addition, can only be considered as so much the better, even without regard to any special advantages in the point of economy, or in any other respect. When these advantages, however, are also held in view, we think there can be little doubt that Mr Knight has done a valuable service to the public in suggesting and realising the plan.

#### IMPROVED LIFE IN THE NEW DWELLINGS FOR THE WORKING-CLASSES.

Dr Southwood Smith has published some striking statistics, shewing 'the power of good sanitary conditions to secure to the working-man and his offspring the like measure of health and life as is possessed by the wealthier classes.' Some years ago, a philanthropic company prepared several sets or blocks of dwellings for operative families in London, all of them arranged and constructed in such a manner as to give advantages too often denied to that class of inhabitants. In the first place, the site was thoroughly drained; secondly, there was free admission of air and light to every apartment. Water was furnished to every house, and each had its own system of drainage. The speculation has been satisfactorily successful in point of return for the money laid out, and the sanitary results have been most remarkable. Out of a population of 1343, the mortality in a year has been 10, or 7 in the 1000, while in the whole of London it has been at the rate of 22 in the 1000. Amongst children under ten years of age, 490 in number, the mortality has been 5, or say 10 per 1000, while in the whole of London the mortality in the same class has been at the rate of 46 in the 1000. After allowing something for the selected character of the inhabitants of these dwellings, we can scarcely doubt, with such results, that the good sanitary conditions have had a very great effect. Such a fact ought to be an encouragement to further efforts for the rearing of an improved kind of working-men's dwellings; and what ought further to stimulate the process, is the fact presented in a late intelligent pamphlet by Mr Cheyne Brady,\* that, out of a multitude of such speculations

in London, Edinburgh, Glasgow, Dublin, and other large cities, not one has as yet failed to yield a fair, while some have actually afforded a very handsome percentage.

#### MAY-FLOWERS.

MAY is come, and all nature seems to be awakened from her winter's sleep. As a fair young maiden, who has arisen at dawn from her couch, and, refreshed by an early bath, goes forth in her morning-robe, looking more lovely in that light and simple attire than when at night she moves amidst a courtly throng, decked in rich silks and glittering jewels—so does May appear. She is not dressed in the gorgeous hues of summer: most of the flowers which form her fairest decoration are of delicate tints; and the green mantle, which she seems to have thrown on in haste, is of the most light and tender hues; and yet is she, thus clad, more welcome to us, and more lovely in our eyes, than June with her glowing roses, or July with her 'streaked gillyflower' and many-tinted exotics.

But what are the flowers that give her charms to May? There is the sweet, sweet cowslip, the airy cradle of that most exquisite conception of the poet's brain, Ariel:

Where the bee sucks, there lurk I;  
In a cowslip's bell I lie:  
There I couch when owls do fly.

And what did our fay see around him in his cowslip-bell, ere the breeze had rocked him into slumber? He must have seen, as he glanced around, that above him rose a long pale yellow tube, in the centre of which was a globe of green, from which hung a long green pendant, terminated by another and smaller sphere, also of tender green, all beset with little glittering gem-like processes, like a chandelier in a regal hall. On the sides of this tube, and a little above the chandelier, he would discern five grooved and moulded ornaments, all powdered over with gold-dust, as it might seem, and depending from five pointed stems wrought out of the substance of the wall of his tubular ceiling. This tubular ceiling he would perceive widened out around him into an alcove formed of five arched divisions, each cleft half-way up, and all of a brilliant golden hue. On each of these divisions rested a bright orange-red mark. These red marks Puck explains to us—

Those be rubies, fairy favours;  
In those freckles lie their savours.

But we doubt this fact: we should rather say that these 'savours' exhale from the sweet honey-like coating which lines the inside of the tube, and hangs in a luscious-looking crop at its summit—that which tempts the bee and butterfly to invade Ariel's home, and rifle it of its sweets. Now, we cannot doubt that our fay, when not lying in the cowslip's bell, would have sometimes been swinging on its fragile stem, and climbing its stalks, and nestling among its leaves; so we may as well describe what he saw there also.

The cowslip is of the natural order *Primulaceae*. The leaf is much like that of the primrose, but never so large. The leafy expansion, when it has reached about half-way down the fleshy midrib, narrows into a mere margin: it is of smoother texture than that of the primrose, less downy and less wrinkled. These leaves are all radial, and grow in thickset tufts, with many blossoms arising from amongst them.

The heads of flowers in fine specimens often contain from twelve to twenty separate corollas, each of which is furnished with one pistil and five stamens (the chandelier and ornaments of our fairy's cell). The calyx is tubular, and, like the petal, ten-cleft. The blossoms are disposed umbel-wise on the summit of a common stalk, which is hairy, and often tinged with red. Few people

\* London: Edward Stanford. 1854.

are aware that the primrose is also an umbellate flower. Trace one of the flower-stalks to the earth, or a little below it, and you will find that it is connected with several others of what appear to be separate flowers—the only difference in its structure from the cowslip being, that in the one, the greatest length of the stem lies between the corolla and the junction with the common stalk, and in the other, between the root and the junction of the stalk and flower-stems. The oxlip is a link between the two, the junction in that flower occurring at about midway between the corolla and the root.

In moist hedgerows, amongst mosses, and generally near some brook—or in shaded woods, basking among the dried leaves round the trunks of old trees, or even sometimes growing on them, we find another of the gems which adorn the coronal of May. This is the pretty little wood-sorrel (*Oxalis acetosella*), called by old Gerard, and the people of his day, Alleluya, or Cuckoo's Meate; 'because,' he says, 'either the cuckoo feedeth thereon, or by reason when it springeth forth and floweth, the cuckoo singeth most, at which time Alleluya was wont to be sung in the churches.' He describes it as 'a three-leaved grasse, a lowe, base herbe, without stalk, the leaves immediately rising from the root on short stems—at their first coming forth folded together; but often they do spread abroad, and are of a fair light-green colour. Amongst these leaves come up small and weak tender stems, such as the leaves do grow upon, which bear small starlike flowers of a white colour, with some brightness of carnation dashed over the same. The flower consisteth of five small leaves, after which come little round knops or huskes, full of yellowish seed.' It is a most lovely and delicate little plant. Its trefoil leaves are of a brilliant emerald hue, tinted with crimson beneath; its stem and root of that transparent carmine tint which adorns the red-stalked rhubarb, and the stalks of both flowers and leaves are of an extremely slight and fragile character. In some states of the atmosphere, the leaves close together, and form a sort of triangular-peaked canopy; and the blossoms, except when under the influence of a full sunbeam, are closed up, and hang on their stalks like drops of congealed dew. The seed-vessel, when ripe, bends downwards, so as to be completely hidden by the leaves, whence the wood-sorrel is usually considered to bear little or no seed. This peculiarity of structure is noticed by a poet:—

Wood-sorrel hangs her cups,  
Ere their frail form and streaky veins decay,  
O'er her pale verdure; but parental care  
Inclines the shortening stems, and to the shade  
Of closing leaves her infant race withdraws.

The whole plant is strongly acid, and from its leaves the poison oxalic acid is drawn. This is done by soaking them in water; and in the sediment they deposit in their decay may be found small crystals, which are the oxalic acid. There is a species of this genus which grows only in the south and south-western parts of England, and is very rare—*Oxalis corniculata*. This bears yellow flowers and long horn-like seed-vessels, and is altogether of a much larger growth.

In the meadows where the floods have but lately retired, or perhaps even yet linger, we find wealth of flowers. There grows the large marsh-marigold (*Caltha palustris*) which

In green and gold refulgent towers,  
And isles of splendour shine, whose radiance throws  
A glory o'er the scene.

There, too, is that noble plant the corn-flag (*Iris pseudacorus*), throwing up its finely formed sword-like leaves in dense forests from the swampy ground, and displaying its bright yellow blossoms; and the many coloured milk-wort (*Polygala vulgaris*), and the rich purple orchises, and the lovely blue hyacinth (*Hyacin-*

*thus nonscriptus*), cluster on every bank, and begem every copse in richest luxuriance, abundantly mixed with the pretty white stitch-wort (*Stellaria media*). This common little flower, which grows everywhere, is one which ought to receive more notice than usually falls to its share. It is a plant of great beauty, from the clean firm growth of its leaves, the very delicate and peculiar tint of the green which they exhibit, and the fine spring of its shoots, buds, and calyxes: the little star-shaped corolla, though pretty, is the least of its beauties. It is also interesting from the circumstance of its having been from this little plant that Linnaeus first obtained his idea of what he calls the *sleep* of plants. In the evening, the leaves approach each other in pairs, so as to enclose between their upper surfaces the tender buds of the plant; the pair of leaves next below the upper pair have longer petioles than the others, so that they can close over the terminating leaves, and thus protect the end of the branch. The flowers are only open for three hours in the day—namely, from nine till twelve o'clock—they do not unfold even at this time, except in sunshine, keeping erect when open, but drooping when folded. After heavy rains, they often remain closed for days together.

But fair as are the meadows in May, the woods and coppices outrival them. What are any of the plants we have named in comparison with the hawthorn, that sweet flower, which so especially belongs to this month, that it even derives its most common name, May, from it? Well may Chaucer eulogise the 'white hawthorn, which so sweet doth smell;' well may every shepherd choose to—

Tell his tale

Under the hawthorn in the dale.

Shakspeare, too, fails not to praise the hawthorn; and Burns, that sweetest of nature's minstrels, can find no dearer name for her he loved than that of this plant, and says—

The hawthorn I will pu', wi' its locks o' siller gray,  
Where, like an aged man, it stands at break of day;  
But the songster's nest within the bush I winna tak away—  
And a' to be a posie to my ain dear May.

Truly, 'the May-flowered hedges scenting every breeze,' are most lovely and attractive objects; and he who has no appreciation of their beauty, must be wanting in some essential qualification for enjoyment. With the hawthorn, we may see the white guelder-rose (*Viburnum opulus*), or, as the Germans call it, the 'snow-ball tree,' beginning to shew its white blossoms, which will, in due time, be followed by those clusters of semi-transparent coral-berries which so beautify the woods in autumn; and there also are the tassels of snowy cherry blossom, and the fine carmine-tinted wild-apple bloom, glowing in their pure beauty, and affording a feast to the 'sedulous bees' humming among the branches. The birds now carol from every spray—the lark, aloft in mid-air, pours out her song of praise; whilst every here and there we see the pretty 'orange-tip butterfly,' or some of the broader winged sulphur coloured, or others of more varied hues, skim along in the air, or pitch among the flower-laden branches; whilst huge dragon-flies hawk about over the brook, in search of their prey of little insects, their gossamer wings glittering like jewels in the sunlight.

But of all the scented gems which 'flowery May' throws prodigally from her lap, which can exceed in sweetness the pearly lilies of the vale? Old Gerard calls them emphatically 'May lilies;' and in that sweet month they may be found hanging their pure white bells beneath the broad shadow of their tent-like green leaves, and scattering odours of unrivalled sweetness throughout the more sheltered and secluded spots in the deepest woodland glades. This fair flower has at all times been considered as the type of that lovely and heaven-born grace—humility.

We all know the value of the lily as an ornament to a lady's parterre, or a set off to her drawing-room table, and we all know how frequently this delicately formed plant has been selected as a model for the sculptor, the painter, and the worker in silver or mosaic, but we may not all be so cognizant of the virtues which our old herbalist Gerard ascribes to it. First of all, he states that 'the flowres of the valley lily distilled with wine, and drunke, the quantity of a spoonful restoreth speech unto those that have the dum palseie,' &c.; adding, 'and comforteth the heart'; secondly, he affirms that 'the water aforesaid doth strengthen the memory that is weakened and diminished;' and thirdly, 'the flowres of May lilies put into a glass, and set in a hill of antes close stopped for the space of a moneth, and then taken out, therein you shall find a liquor that appeaseth the pain and griefe of the gout.' This flower boasts the botanical name of *Convallaria majalis*. The Germans call it *Mayen Blumen*.

No month will furnish so rich a plateau or vase of wild-flowers as this most lovely May. You may cluster together the exquisitely delicate green of the young oak, just started into leaf, and with it the light catkins, which are just being developed, and the carmine-tinted bunches of oak-apples, which in some years cluster so thickly on its young twigs as to make you almost fancy, that instead of being a mere blight, theirs must be a pleasant fruit; and then mix with this tender green the blue of the hyacinth, the rich purple of the various tinted orchises, the snowy anemone, and the blushing wild-apple blossom, and you have such a varied and brilliant ornament for your table, as can never be culled save from the hedges and meads in early spring. Or if you prefer a high vase, where will you find such perfect grace as in the drooping tassels of the different carices and rushes, the irises and sedges, and the abounding variety of form and colouring which are supplied you by the different species of meadow-grasses? Oh, May is a lovely month! The nightingale tells you so as she thrills her rich notes in the moonlighted glade; the thrush and black-bird, and all the thousand choristers of hill and dale, tell you so as they greet the first glances of the sun; the lark tells you so, as she mounts on high through the liquid ether, raising her clear notes of praise; and above them all we may hear the voices of young lovers rejoicing in the spring of life, the May of human existence, and telling you that this season of returning warmth, and light, and beauty, is but a transcript of the warmth, and light, and joy which irradiate hearts where faithful love and well-grounded confidence have taken up their abode, and which are already cemented by ties which no chilling blasts of the future shall ever have power to dis sever, because God himself has bound them to each other and to himself.

## THINGS AS THEY ARE IN AMERICA.

### CINCINNATI TO NEW YORK.

'The life of a Mississippi steamer is five years,' said a gentleman with whom we were conversing on the subject of river-navigation; and he added, that there was so constant a demand for new vessels, that about thirty were built every year in Cincinnati. I went on board several of these splendid but short-lived steam-boats, as they lay on the banks of the Ohio, and would have gladly descended to New Orleans in one of them, if not warned to keep at a respectful distance from the lower Mississippi, on account of the prevalence of yellow fever.

From the centre of the long quay where the steamers draw up at Cincinnati, a large and commodious ferry-boat crosses the Ohio at short intervals to Covington, a town still in a rudimental state, but becoming a place

of residence for persons whose business connects them with Cincinnati. There are a few manufactories in the place, but with these exceptions, Covington does not shew any marked signs of activity, and the contrast with the bustle of business on the Ohio side is somewhat striking. The comparative dulness is ascribed to the disinclination of free emigrants and workmen to settle in Kentucky, where they would be brought in contact with slavery.

To say nothing of slavery abstractedly, anything calculated to retard the development of industrial occupation in this fine part of the country is much to be lamented. The Americans themselves are scarcely aware of the productive powers of the sunny banks and fertile and far-spreading valleys adjoining the Ohio. The grape, which is grown with advantage in various parts of the States, here attains that peculiar perfection which adapts it for the manufacture of wine. Several enthusiasts in horticulture, among whom may be mentioned Mr Longworth, have, for the last twenty years, in the neighbourhood of Cincinnati, devoted much attention to the grape; and now, within a circle of twenty miles, there are upwards of 800 vineyards, which lately produced in one year 120,000 gallons of wine. I had the curiosity to taste two of the best kinds of this native product, made from the Catawba grape: one resembled a dry hock, and the other was an effervescing champagne, light and agreeable to the palate. So popular have these become, that at no distant day foreign wines of a similar class will cease to be imported. I found, likewise, that under the encouraging auspices of a horticultural society, the strawberry is brought to great perfection on the banks of the Ohio, and that, during the season, as many as 200 bushels of this fruit are brought every day into the market of Cincinnati. Not satisfied, however, with this large local sale, the producers, I was told, are opening a trade with New Orleans, to which the strawberries are sent packed in ice. Sixteen hundred miles seemed to me rather a long way to send strawberries to market; but when did an American think of distance?

Public education being enjoined, and liberally provided for, by the laws of Ohio, the stranger who takes any interest in such matters will find in Cincinnati numerous schools worthy of his notice, in which instruction of the best quality is imparted without charge to all pupils indiscriminately. Where free education exists in England, it is a charity: here, it is a right. The natural fruit of a system so exceedingly bounteous, is an educated population, possessing tastes and aspirations which seek a solacement in literature from the materialities of everyday life. I do not know that I ever saw a town of its size so well provided as Cincinnati with publishers, libraries, and reading-rooms. The Young Men's Mercantile Library Association has a most imposing suite of apartments fitted up as a library and reading-room—the number of books amounting to 14,000 volumes, and the reading-room shewing a display of desks on which are placed nearly a hundred newspapers. Cincinnati is, I believe, also favourably known for its cultivation of the fine arts; and its exhibitions of pictures at any rate shew that its inhabitants do not employ all their time in mere money-making. In the cathedral of St Peter, there are some valuable paintings by European artists; one, by Murillo, having been a gift from Cardinal Fesch.

My return from this interesting city of the West was made by means of the railway to the flourishing city of Cleveland, whence I proceeded by a continuation of the line to Buffalo, at the foot of Lake Erie. In quitting Ohio, where so many indications of advancement present themselves, I would take leave to remind intending emigrants, that for fertility of soil and geniality of climate, they will find few places within a moderate distance which can match this exceedingly fine state.

For its crops of Indian corn and wheat, its wool, beef, and pork, it enjoys a wide celebrity; and, as has been seen, its southern and picturesque frontier, with an Italian climate, yields a much-admired variety of wines. In the more cleared parts of the state, land, of course, sells at a comparatively high price—say, at from thirty to fifty dollars per acre; and therefore this is not a district for the settlement of a humble class of emigrants, who look to the immediate acquisition of property.

In travelling through the state of Ohio, some of the land is seen to be still under forest; and in numerous places, to accommodate the line of railway, a passage has been cleared through the dense growth of trees. Here and there we pass small towns of neatly painted houses—the germs, it may be, of great cities; and wherever the cars stop, there is a considerable traffic in the exchange of passengers. The train that carried me from Cincinnati consisted of six cars, including among the passengers a number of pedlars, who, with basket in hand, went from car to car, while the train was in motion, offering books and newspapers for sale. One of these travelling merchants went to work in a methodical manner. First, in making his rounds, he left with each passenger a circular descriptive and recommendatory of a particular book, and in due time returned for orders, which he executed on the spot. On some of the lines of railway, peddling in this and other forms has become so offensive, that it is now forbidden. Besides visits from the traffickers in books and newspapers, the passengers in the train were waited on every hour by a negro boy, supplying glasses of water. With a tin watering-pot in one hand, and a tumbler in the other, he respectfully addressed each person in turn. The providing of water in this manner, seems to be part of the railway system in the United States. I, at least, saw few trains without a supply of water for passengers. Sometimes a vase and drinking-glass occupy a spare corner in the car, and every one is left to take care of himself; but more frequently the water is carried round for general accommodation. As vases of water are likewise exposed for public use in many of the hotel-lobbies, one is impressed with the belief that the Americans are the greatest water-drinkers in the world—whether as a matter of taste or necessity I am not able to say.

It is an unfortunate peculiarity in American railways, that certain states have adopted different gauges, so that a break necessarily takes place in passing from one to another. In the journey I was now performing, I had occasion to leave the state of Ohio; pass through about twenty miles of the state of Pennsylvania; and finish in the state of New York. In each of these states, the tracks were of a different width, and the shifting was anything but agreeable. One of the changes took place at the town of Erie, which, as may be known by scraps of intelligence in the English newspapers, has lately gained a most unenviable notoriety for unlawful outrages. The cause of this disreputable procedure is singular. The proprietors of the line being desirous to extend the New York gauge through the adjoining part of Pennsylvania, and so make one break less in the length of railway, the people of Erie became alarmed at the prospect of trains passing through their town without stopping; and to prevent this calamity, they tear up the rails as fast as they are laid down. I believe that in attempting a uniformity of gauge at the spot, so as to avoid breaking bulk, the railway is transgressing some pre-arrangement with the parties interested; but into the actual merits of the quarrel I do not go. What is to be lamented, is the continuance of a series of outrages for months, to the derangement of traffic and the great scandal of the American people; for foreigners who hear of these strange doings, naturally impute them to a disregard for law, and a culpable negligence or weakness on the

part of the executive power. Assuming that the inhabitants of Erie should ultimately and legally enforce the stoppage of trains and breaking of bulk within their city, it will be interesting to note what the country to the west will do under the circumstances. Meanwhile, it is not the least curious and incomprehensible thing about the Erie outrages, that they are promoted by the mayor of the city, and are sympathised in by the governor of the state of Pennsylvania!\*

Arriving at Buffalo, where I spent a little time, I found another remarkable example of the sudden growth of a populous city; for, although it was laid out so lately as 1801, and burnt to the ground during the miserably conducted war of 1812–18, it now numbers 60,000 inhabitants, and is a substantially-built and most respectable-looking town. Considering its situation, Buffalo could not have failed to expand into importance. It stands at the foot of Lake Erie, at the opening of the canal to the Hudson; and besides having a large traffic from this cause, it is now a central point for several railways, the latest of its advantages in this respect being its connection with the Brantford and Goderich line, now opened through Canada. The town has a fine prospect over the lake and the Canadian shore, to which large ferry-boats are constantly plying. The building of steam and other vessels for the lakes is carried on to a large extent, and to all appearance, I should say, Buffalo is one of the most thriving marts of trade and commerce in the United States.

After seeing so much of the bustle of business in Cincinnati, Cleveland, and Buffalo, it was a grateful relief to make a leisurely journey through that charmingly retired part of the state of New York, in which lie several small lakes, celebrated for the picturesque and rural beauty of their environs. My way was by the small town of Batavia, from which to Canandaigua, situated on a lake of the same name, the country was of a very pleasing character. Instead of being a dead and monotonous level, the surface became diversified with hill and dale; white villages and churches occurred at proper intervals; the ground was generally cleared and under good farming; and only so much forest was left as served to ornament the landscape. For a tract of forty or fifty miles along this route, with Canandaigua as its centre, the country, so far as I had an opportunity of judging, is one of the most pleasing parts of America. Western New York, however, is nearly all a choice district; and as it has now been settled for a long period, it shews numerous tokens of an advanced condition. We see fields in which there are no stumps—always a sure sign of antiquity; and one fancies from the look of the villages, that he might find in them as many as three generations of inhabitants.

Although prepared by these appearances of maturity, which greatly reminded me of home, I was, notwithstanding, surprised by the staid, and—I must use the word—genteel, aspect of Canandaigua. Excepting that many of the houses were of wood, there was little to suggest the idea that we were out of England. Imagine a pretty piece of country, with hills of

\* On Monday, the railway across Sycamore Street, in Erie, was torn up at about noon, in obedience to the orders of the mayor. The reason alleged for this renewed attack upon the railway company is, that certain cars, containing freight from Cleveland for Buffalo, were sent through direct, instead of being stopped at Erie, and the property there snatched. The sheriff of the borough was promptly on the ground, and did everything in his power to prevent the track from being removed, making an earnest appeal to those who were present to aid him in enforcing the laws, and in preventing any infringement of the rights of the company. The spectators, however, stood regardless of the appeal, and permitted the employés of the mayor to proceed with their work. It is proper to add, that this fresh outburst of Erie indignation will not interrupt nor retard the travel between Buffalo and the West. The break extends only a few feet, and is simply made, as we are informed, as a means of preventing freight-cars from passing Erie without breaking bulk.—*New York Tribune*, March 17, 1864.

moderate height clothed in woods of brightly variegated foliage—a beautiful sheet of water, fourteen miles long and from one to two miles in breadth, glittering like a gem amidst these picturesque elevations—and on a broad slope rising from the northern extremity of the lake, a town, consisting for the greater part of detached villas, the abode of a retired and tranquil population. Such is Canandaigua; a place of repose—an anomaly in a land of everlasting bustle—a Cheltenham without racket. Extending upward from the margin of the lake, the main street is fully a mile long, and as broad as a fashionable square in London; and, as is usual in America, it is lined on each side with a row of trees, which offer an agreeable shade in summer. At the centre, this spacious thoroughfare is crossed at right angles by another street, along which the railway has been laid, so as to make the terminus exactly in the middle of the town. Adjoining this central point, we find a hotel of the ordinary gigantic dimensions, which I can recommend for its good management. With all suitable conveniences, in the way of stores, educational establishments, libraries, and churches, according to taste, and with society of quite a select class, this town of villas, and gardens, and rows of trees, and green paddocks for sleek horses and cows, and stylish equipages driving about making calls, and a lake for boating and fishing, is really the beau-ideal of a place where one would like to spend the quiet evening of life.

Here, at anyrate, I passed two or three days with no common satisfaction in the mansion of a kind friend, who had been long resident in the country, and I was glad to have an opportunity for making some inquiries respecting the price of land and other subjects of importance to emigrants. I have already mentioned that the western part of the state of New York is, from geniality of climate, fertility of soil, and other advantages, exceedingly eligible for the settlement of agriculturists. At Canandaigua, cleared farms of various kinds may be heard of for sale, but at prices corresponding to the advanced value of property; and if uncleared or partially cleared lands are wanted, they also can be had without trouble, and at a very moderate cost.\*

Any one looking at a map of the States, will observe that in this part of the country there is a number of lakes, besides that of Canandaigua, the whole stretching in the same direction parallel with each other. All are beautiful, with pretty towns in their vicinity—Geneva, at the head of Seneca Lake, being one of the largest of the group. According to geologists, the several valleys embracing these sheets of water were at one time—but who can tell how long ago?—the channels of outlet of Lake Ontario, which thus found its way to the Hudson. No one can travel by the line of railway which pursues its course along the heads of the different lakes to Syracuse and Utica, without seeing evidences of the action of rushing water on the face of rocky steeps, and being, accordingly, impressed with the belief that great changes must have taken place in this interesting district.

The railway from Canandaigua, which is an extension of that from Rochester, passes successively through a number of towns rapidly growing in size, and attaining considerable importance as seats of manufactures. The principal town of this kind is Syracuse, celebrated for its extensive manufacture of salt from brine-springs. The water is pumped from deep wells, and the salt is made, according to quality, either by solar evaporation, or by boiling. There are now about 200 manufactories of this article, and as much as 5,000,000 of bushels are

produced annually. The land in which the wells are sunk being public property, the state, as I understand, receives as duty a cent per bushel. As Syracuse is situated on the Erie Canal, and communicates by railway in different directions, it has many facilities for trade: it is a well-built and rapidly growing city.

Southwards from Syracuse, the railway gets into the valley of the Mohawk, and after passing the flourishing town of Utica, much fine scenery is disclosed. At Little Falls, a small but busy town situated among rocky protuberances and overhanging cliffs, with the river dashing and leaping over its rugged channel, the draughtsman would find numerous subjects for his pencil, equal in picturesque beauty to some of the best points in Swiss landscape. When we consider that only seventy years have elapsed since pretty nearly the whole of the district through which we are passing was a wilderness possessed by tribes of Indians, its present condition as an apparently old-settled country, with thriving cities, elegant mansions, and improved farm-establishments, seems quite marvellous. A gentleman at Canandaigua told me that, about forty years ago, he could not reach Albany in less than a week, the journey being one of great toil on horseback. Now, the distance is performed by railway in ten hours.

My previous visit to Albany having been very brief, I now remained some time in the place, to see its State-house, public libraries, and normal-school establishment. The State-house, situated on the top of the rising-ground on which the city has been built, is a conspicuous and elegant structure, devoted to the meetings of the legislature of the state of New York. In connection with it, I was shewn a library of 30,000 volumes, for the use of members, and open to the public. A considerable number of the books are of the best English editions, no expense being spared to procure works of the highest class in general literature. Adjoining is an extensive law-library. Among the more interesting works shewn to strangers, is a series of large volumes, embracing the printed legislative proceedings since the English organisation of the colony. It is interesting to observe in the series, how, at the Revolution, the British royal arms and styles of expression are quietly dropped, and followed by the republican forms, as if no break had taken place in the course of procedure. One of the volumes during the colonial régime purports to be printed by Franklin. There are likewise shewn some old colonial charters from the king of England—dingy sheets of vellum, kept as curiosities in glass-cases, along with mummies from Thebes, and other instructive antiquities. It is pitiable to see 'George the Third, King of Great Britain, France, and Ireland,' as he is styled in these old writs, reduced to this condition; but at the same time, it must be allowed that if George and his advisers had possessed a little more discretion, his charters and those of his descendants might have been living utilities, instead of obsolete curiosities.

At the time of my visit, a new building for a state-library was fitting up at an expense of 80,000 dollars. On the opposite side of the square stands the State-hall, containing the administrative offices of the state; and near it is the City-hall. Both are of white marble, and have a fine architectural effect. In these several establishments I received every desired information; and on my departure, I carried with me not only the grateful recollection of much undeserved kindness, but presents of state-papers and reports on a most munificent scale. Of all the states in the Union, that of New York has excelled in the grandeur of its public documents. Numerous statistical, historical, and scientific investigations have been issued at the expense of the state, in a series of large and splendidly illustrated volumes; and these are imparted in a manner so liberal and considerate as to command universal respect.

Originally a Dutch settlement, Albany in the present

\* Larger or smaller quantities of land, of excellent quality, may be purchased at the office of J. Greig, Esq., Canandaigua. The person in charge of the office is a gentleman from Edinburgh, who will afford all proper information, and in whom every confidence may be placed.

day is a substantial city of thoroughly American appearance, with about 60,000 inhabitants; and its situation near the head of the navigation of the Hudson, renders it a flourishing emporium of commerce. Steam-vessels daily descend the Hudson to New York, making a voyage of 125 miles; and the return-voyage upwards is considered to be one of the most agreeable trips in river-navigation. The time of departure of the boats not being quite convenient for me, I descended, not by steamer, but by railway—the line, in many parts of its course, being erected on piles within the edge of the water, and at other places keeping within sight of the finer parts of the river. After so much has been written by travellers of the scenery of the Hudson from New York to Albany, it will not be expected that I should describe its varied beauties. For about twenty miles, midway, it goes through a picturesque mountainous district, known as the Highlands of the Hudson; and here it may be said to resemble the Rhine without its ruined castles. Instead of these, we have several forts—among others, West Point, of historical interest—many pretty villages and mansions, and here and there islands of the rarest beauty. In the vicinity of this mountain-tract, we have the town of Poughkeepsie, on the left or northern bank. For sundry reasons—one of them the desire to see an old friend, and another to visit a venerable American writer who lives in the neighbourhood—I stopped at Poughkeepsie for a couple of days. A more delightful little town can hardly be imagined. Not so retired as Canandaigua, it has yet a good deal of its character. Lying basking in the sun on the sloping banks of the Hudson, its long streets lined with trees, and its neighbourhood dotted over with detached villas—some of them in a fine Elizabethan style of architecture—and situated within an hour and a half by railway of New York, it is doubtless one of the most pleasant places of residence for those who do not choose to be in the world, and yet not quite out of it. Poughkeepsie has several large manufactories, and a considerable trade with the adjacent parts of the country; and with a population of 14,000, I was assured it does not own a single public-house—a phenomenon worth mentioning.

One of the days during my stay was devoted to an excursion to the residence of Mr Paulding, situated a few miles from the town, on a rising-ground commanding a view of the Hudson and Catskill Mountains beyond. The visit to the spot, with its literary and other associations, is an incident long to be remembered with pleasure. A ride by railway carried me speedily from Poughkeepsie to New York—a place far too important to be noticed at the end of this rambling account of my journey eastwards. W. C.

#### VISIT TO A TURKISH CASTLE.

WE started at ten o'clock, one fine morning, a small party of four, for a stroll through the woods to the castle of Pacha Shemie, a venerable-looking old gentleman, whose acquaintance we had previously made, and who had promised to shew us his farm when next we honoured him with a visit. We provided ourselves with sundry bottles of Tenedos wine, one of cogniac, some kid-pies, reindeer-tongues, &c., and we took our guns and servants, intending to bivouac under the shade of the tall trees during the heat of the day.

We shot a fine hare, several head of game, and a brown bird very much resembling a bird of paradise, here called a *poo poo*, which was stuffed on our return to our ship. But shooting is thirsty work, and we looked in vain for a stream of water to cool our wine in; so we thought it our best plan to proceed at once to the pacha's castle, and ask for a jar of water—the exigency of the case being a fair excuse for breaking the noonday repose of the inhabitants. On arriving

there, we knocked and shouted very unceremoniously, considering it was at the castle-gate of one of the nobles of the land; but Englishmen do strange things in strange countries. At length the pacha himself answered our summons. Instead of the rich and picturesque vestments in which we had formerly seen him, he now descended in a morning-dress of white linen, and demanded in a surly tone the cause of our intrusion. It was evident that he did not at first recognise me in my shooting-jacket and broad-brimmed sombrero, but he recovered his composure on being reminded of our former visit, his own hospitality, and the portrait we had sketched of himself and his pretty little daughter Fatima. He then disappeared, and, to our great surprise, returned speedily in full costume—a gorgeous silk dress, with a scarlet sash, a splendid diamond ring, &c. Going through the ceremonies of a courteous reception, he invited us to go in and see the 'castillio.' In we went, accordingly, and all over it he took us. No sign of life was in it at all. He took us into one room full of magnificent Turkish saddlery, and then into another in which he kept his arms. There were some beautiful Turkish scimitars, in silver scabbards, with such razor-like blades that I felt as if my head was off while looking at them. There were also some pistols of rich and curious workmanship, and before the doors, in each room, hung a verse of the Koran. We ascended by a dark and narrow staircase to the top of the castle, which commanded a fine view of the Dardanelles, and the forts of Sestos and Abydos, so famous in classic story. Upon examination, we saw that we were in a stronghold, a sort of Blue Beard's castle, which idea was rather increased by the report of one of the servants who had been sent down a trap-door to draw water out of the well, which was in the centre of the building—that 'it smelt as if half-a-dozen dead bodies were down there!' And there was a strange, distrustful tone about the whole place. There were iron doors to some of the rooms, into which our host did not introduce us, and these, we concluded, were the doors of the harem. The entrance-door was in the centre of the building, some twenty feet from the ground, and the only way to reach it was by passing over a narrow bridge. When this was cut off, the place was inaccessible, for all the windows were small, and iron bars crossed them in every direction.

Having obtained a supply of water and a vessel for cooling our wine, we proposed adjourning to the fields to discuss our provisions. We asked our friend the pacha to accompany us, and he promised to join us as soon as we had finished our meal. Under the shade of a broad spreading oak-tree, we arranged our feast, the bread-bags in which we had brought it serving for table-cloth. As we were reclining upon the grass, the pacha's two wives, closely veiled, and his two children, passed before us, attended by several black slaves, in a sort of procession. They were either going to or returning from the bath. Shortly after, we saw the old pacha himself, with his son, a fine boy of about eight years of age, his little daughter Fatima on a donkey, and a retinue of blackies, crossing the fields and coming towards us.

He joined our little party, and sat cross-legged by my side with the little Fatima and his son. Fatima was a lovely creature: she was not in the least shy; she only smiled, and looked inquiringly at me with her large fawn-like eyes when I took her little hand in mine to examine the colouring of *henna*, with which, according to the custom of her country, her fingers were deeply stained. Her eyebrows were made to meet with something that had very much the appearance of burned cork. She had been decorated for the occasion with a turban, in addition to her usual costume. The little boy was clad in richly embroidered silk; and altogether, I think we must have formed a

very picturesque group, with our background of peak-like trees and woodland slopes.

We offered wine to our guest, which he smelt, and then, shaking his head, said, with evident disgust: 'Sensatemi, signore, the Prophet has denied it; the Mussulman may not taste of the juice of the grape.' But when we offered him brandy, his eyes sparkled, and he tossed off about half a tumbler of it raw, although we recommended water with it; and then he took another, and then another and another pull at the same generous liquor, until he ended by finishing the bottle—a feat he accomplished before he had been cross-legged an hour and a half. Of course he became very 'royal' and very amusing. In a short time, the stateliness of the old Turk had quite departed. He sang and danced; slapped me repeatedly on the thigh, which he made to sound again, and which seemed a favourite amusement with him; then, all at once, making a dash at me, he would have bestowed on me a most affectionate kiss, had I not cried out for help, exclaiming: 'Take him off! take him off!' upon which he turned his polite attention to another of our party, who, however, pulled the old pacha's beard so hard, that he at length desisted. The old Turk had been a soldier in his youth; and military glory, 'the ruling passion strong in grog,' returning upon him, he seized a loaded gun which lay beside us, and began to figure away with it. But when he came to the word 'Present,' I made a rush and dispossessed it of its cap, and then I did not care, but 'fell in' with him, with my stick shouldered; and we marched up and down together, calling out our different words of command, to the great amusement of our friends.

But the sun began to get low in the sky, and little Fatima grew tired, and cried to go home; so I took hold of one of the old pacha's arms, my friend seized the other, and between us we almost carried the old ruffian home, for walk he could not. He would have inflicted on me another drunken kiss, but being a little man, could not reach me, and I was easily able to ward off his polite intentions in that way. Arrived at the castle-gate, he shouted loudly, and out came slaves, black and white, and children too, and much they marvelled to see the old Turk drag us all after him into the old den again—Turcomans being very tenacious of admitting Giaours under the same roof with their wives. The Giaours were wicked enough to wish to see these said wives, and presently, while the pacha was grinding away on the stairs upon a broken-winded old hand-organ of singular construction, with an attempt at a song, two very pretty heads were thrust out at the iron door we had before noticed. Very young and very beautiful were they, but they quickly disappeared; and when the youngest and most indiscreet of our party, with boy-like curiosity, tried to peep through the keyhole, in order to get another glimpse of the fair inmates of the iron-doored chamber, the little Mussulman, who, as I said before, was a fine boy of about eight years old, placed himself before it, and shook his fist most vehemently; nor would he move away from the place he had taken upon himself to protect. As Mrs Blue Beard and Sister Anne appeared no more, and their drunken lord did not seem inclined to introduce us to the ladies, we at length beat our retreat amidst his repeated shouts of 'Bravo! bravo! Inglesi; bravo! bravo!'

#### MENDELSSOHN.

There was this inexpressible comfort in all intercourse with Mendelssohn, that he made no secret of his likings and dislikings. Few men so distinguished have been so simple, so cordial, so considerate; but few have been so innocent of courtiership, positive or negative. One might be sure that a welcome from him was a welcome indeed. I thought then, as I do now, his face one of the most beautiful which has ever been seen. No portrait extant does it justice. A

Titian would have generalised, and, out of its many expressions, made up one which, in some sort, should reflect the many characteristics and humours of the Poet: his earnest seriousness—his childlike truthfulness—his clear, cultivated intellect—his impulsive vivacity. The German painters could only invest a theatrical, thoughtful-looking man with that serious cloak which plays so important a part on the stage, and in the portraits of their country; and conceive the task accomplished, when it was not so much as begun. None of them has perpetuated the face with which Mendelssohn listened to the music in which he delighted, or the face with which he would crave to be told again some merry story, though he knew it already by heart. I felt in that first half-hour, that in him there was no stilted sentiment, no affected heartiness; that he was no sayer of deep things, no searcher for witty ones; but one of a pure, sincere intelligence—bright, eager, and happy, even when most imaginative.—Perhaps there was no contemporary at once strong, simple, and subtle enough to paint such a man with such a countenance.—*Chorley's Modern German Music.*

#### A CHILD'S SMILE.

'For I say unto you—That in heaven thy angels do always behold the face of my Father which is in heaven.'

A CHILD's smile—nothing more;  
Quiet, and soft, and grave, and seldom seen;  
Like summer lightning o'er,  
Leaving the little face again serene.

I think, boy well-beloved,  
Thine angel, who did weep to see how far  
Thy childhood is removed  
From sports that dear to other children are,

On this pale cheek has thrown  
The brightness of his countenance, and made  
A peace most like his own,  
A beauty that we look on, half afraid:

Marvelling, will it stay  
To manhood's prime, or will that angel fair,  
On some yet unknown day,  
Take the child-smile, and leave the wrinkle Care.

Nay, fear not. As is given  
To thee the father's look, fond watching o'er:  
Thine angel, up in heaven  
Beholds Our Father's face for evermore.

Ah, may He help thee bear  
Thy burden, as thy father helps thee now:  
That thou mayst come to wear  
That soft child-smile upon an old man's brow!

#### SLEEP OF PLANTS IN THE ARCTIC REGIONS.

Mr Seemann, the naturalist of Kellett's arctic expedition, states a curious fact respecting the condition of the vegetable world during the long day of the arctic summer. Although the sun never sets while it lasts, plants make no mistake about the time when, if it be not night, it ought to be, but regularly as the evening hours approach, and when a midnight sun is several degrees above the horizon, droop their leaves and sleep, even as they do at sunset in more favoured climes. 'If man,' observes Mr Seemann, 'should ever reach the pole, and be undecided which way to turn when his compass has become sluggish, his timepiece out of order, the plants which he may happen to meet will show him the way; their sleeping leaves tell him that midnight is at hand, and that at that time the sun is standing in the north.'—*American Annual of Scientific Discovery.*

## CROSS-THINKERS.

For what end it may have been designed, we cannot tell; but the fact is certain that, in all questions, great and small, public and private, there is a class of minds which are sure to embrace the side of weakest argument. For a palpable and certain truth such persons have no relish. A great broad principle, which recommends itself to the common sense of the bulk of mankind, is, in their eyes, an impertinence. In a doctrine everywhere prevalent and popular, they see only vulgarity. A deduction irresistibly logical only excites in them the suspicion of some profounder error. If, on the other hand, you tell them something extremely hard to believe, they will make a manful struggle to swallow it, and probably will succeed. As Milton's Satan says: 'Evil, be thou my good,' so they cry: 'Sophism, be thou our reason!'

The pious Jesuit who said: 'I believe it because it is impossible,' was a type of this class. Any one can believe the possible—there is no merit in that; but to accept in unshrinking faith something utterly incongruous with experience and common sense, is to do that which few can do, and to do it is, accordingly, great glory. There is some vanity in the matter, after all. If I go with the multitude, my voice is lost in it. I may be right, but I attract no attention. But if I stand up by myself, or with some small party or sect, and declare my attachment to some strangely heteroclitic ideas, I at least do not pass notelessly. The mass feel a little troubled by my dissent, and perhaps even think it worth while to take some pains to bring me over to their way of thinking. One becomes somebody in these circumstances.

It is also observable of this class of thinkers, that, even when they concur with the majority in any profession of faith, they quite disregard all the leading and important points of the system, and fasten exclusively upon some merely external or accidental peculiarities. A fundamental doctrine which most men feel goes down into the profoundest depths of their moral being, has no attraction for them; but they are careful to see the upholstery and millinery of the system preserved in all their ancient integrity. Just because a thing looks of no consequence, they think it important. Were it really to become of consequence, they would desert it.

In any new political attitude of the nation, our friends are always seen, like Harry Wynd in the Scotch story, fighting for their own hand. While the country at large concurs in thinking the war with Russia necessary and just, however much to be deplored, Mr Urquhart stands out, a solitary dervish,

proclaiming that, in the secret reality of the case, it is a conspiracy of the British ministers with the Czar against Turkey! According to him, we are to have a terrific war merely to mask an ulterior design totally opposite to what appears! Cross-thinkers never hesitate as to the amount of wickedness of which they believe human nature to be capable. To make out some favourite improbability, they would not hesitate to consider it possible, regarding a public man, that he would coolly order the sacrifice of two millions of fellow-creatures for the gratification of a whim; but they are sure to relieve from such charges all the real villains of the play, and to attach the possible guilt only to some individual noted for his philanthropy and good intentions.

An almost superhuman suspiciousness is a constant feature of the Cross-thinker. In his headlong tendency to suspect, he produces the most curious medley of ideas. He will proclaim, of some noted demagogue who has not a particle of religion in his constitution, that he is an emissary of the pope. He considers Mr Cobden as secretly in the pay of the Czar. The Jesuits are figures in most of his plots; and the less they are seen in anything, he deems their presence there the more certain. According to him, an author is not the author of his own books. There is always some person behind backs who writes them for him. He may write some other body's books, but not his own. When the Cross-thinker sees a political opponent taking a course which shews a remarkable degree of moral courage, and obviously exposes him to damage in his worldly affairs, he feels assured there is some transcendental selfishness at the bottom of it. When the 3000 English clergy withdrew from their charges, rather than submit to the Act of Uniformity, he would have been quite clear that they had good grounds for expecting to better their incomes by what they were doing. A very martyr burning at the stake would scarcely get credit for sincerity with our Cross-thinker. There would be great reason to suspect that he had been all along acting a part, and at the last moment had expected to be reprieved.

In considering by what means any great result has been brought about, our friends overlook all the prominent and great causes, and seldom fail, with an air of mysterious sagacity, to draw our attention to certain others so small as to appear almost indifferent, or which possibly you are more inclined to rank as obstructions. For example, they would never think of attributing the best points of the general character of the gentlemen of England to either the inherent qualities of the stock, or what may be sound and good in the education to which they are subjected. They

would profess to see some vast influence for good in the fagging-system of the public schools—that system by which a boy of fourteen is entitled to tyrannise over a boy of ten, and make a menial of him, as if it could be good for any one to be either oppressed or an oppressor. With a perverse ingenuity which would be amusing if it were not so sadly out of harmony with truth, our friends will argue for a virtue in that which is in reality a vice. They will give to a base old bad thing, which only has not succeeded in preventing real intellectual and moral advancement, the credit of all the good which has been accomplished. The fact is, a true cause is a vulgar stupid thing, which anybody can appreciate. If you wish to make anything for yourself out of the case, you must strive to establish some no-cause as a cause—always the more merit the less tenable your propositions. Let no one be afraid of wanting support for his conclusions in favour of such improbabilities. Just in proportion to the untenableness of his doctrines, he will be the more certain to have a party rallying round him, to proclaim his amazing profoundness of view, his irresistible logic, his almost supernatural sagacity.

Cross-thinking has of course a literature of its own, and also a system of criticism. One Corypheus of the set writes a huge history, in which everything is traced to the least operative causes, and the lessons of all the principal events are duly misread. Another is the oracle of a journal, which for a long course of years has done all it can to resist whatever is calculated for the good of the community. In Cross-thinking criticism, you find all the swans of the great public described as geese, and all the geese as swans. Such was the case with Horace Walpole, of whom it is remarked that, all through his correspondence, he speaks favourably of only the second-rate geniuses. From his whimsical, jealous, and illiberal mind, it clearly appears that a manly appreciation of the true wits was not to be expected. The Cross-thinkers, however, are not always themselves of mean account in literature. It is rather a sad reflection, that some of the men of most brilliant literary powers rank among those who devote themselves on all occasions to make the worse appear the better reason. Unfortunately, to possess eloquence is not necessarily to possess also the inclination to use it solely for good ends. Crotchet and vanity take the direction of but too much of it. The very fact that it is much easier to make a stir with eccentric opinions, than with those which have the support of truth and general approbation, is the cause why an immense proportion of the talent which arises is from the first perverted, and ever afterwards misused. And we hardly know a more sad spectacle than that of a man of brilliant gifts being thus led into false relations to his species, and condemned at the end to look back upon efforts of which the best that can be said is only this, that they have not been sufficiently powerful to extinguish truth, or obstruct the course of civilisation.

Cross-thinking has a great charm for young minds. It is quaint and striking, often droll—looks like something to which the Few are privileged—is free from that vulgarity which is so apt to beset any great cause in which the sympathies and interests of multitudes are concerned. Hence young men of talent are extremely liable to fall into the habit, and so to get into connection with professions and parties from which they cannot afterwards shake themselves free. It is for them a great misfortune, for generally it tends to frustrate the benefits of what talent and education they may possess. Powers and accomplishments that might have advanced good objects for the public, are then spent in a necessarily futile attempt to obstruct them. Some false glory may result. In other words, a foolish few will applaud, while the majority look on with wonder and pity. But in the long-run, all is found to have been barren, and wanting of true savour. The

world will at the utmost accord the meed of talents misapplied. Even from those who have all along been applauding, there will only be found that kind of support which the reckless get from their friends, and the vicious from the companions of their iniquity. The final sentence is—'Here lies a man who chose to live in vain.'

## WEARYFOOT COMMON.

### CHAPTER XX.

#### DOUGHTY DEEDS.

'WHAT! only at breakfast, Fancourt?' said Adolphus, as he entered the hermit's cell; 'you are usually livelier in the morning than that.'

'I have already breakfasted,' replied his friend—'I think I have. O yes, long ago; but I fancy I have been dreaming awake, probably visiting some of my châteaux en Espagne. You know we have nothing to do this morning. Isn't it odd how habit steals over one? I fancy every now and then that I want to go and dawdle away the forenoon with the Simpletons; and they are just now at Wearyfoot Common, with their day half over, and Sara, perhaps, lounging on the garden-seat she told me of, overhung with—no, not with shadowy foliage at this season, but with spring-buds—and thinking, thinking—I wonder what she is thinking of!—London, I shouldn't wonder, the Picture Exhibition, the beasts and beastesses in the Park Gardens, the Whispering Gallery'—

'What is all that to you?' said Adolphus impatiently—'you are in a dream still, and don't know what you are saying!'

'How should I know, when we are all at sea in this way? It's a horrid bore to have to think of how to pass one's day. If those people had only had the sense to stay where they were, I could have cut out work for them that would have lasted the whole spring and summer through. I have a good mind to take that hairy captain's invitation, and go down by and by to run upon the Common, as he says. How the donkeys would scamper before us! and how Rosy-apple's cheeks would glow with the exercise, her bonnet falling back upon her shoulders, and her veil streaming upon the wind!'

'I tell you what, Fancourt,' said Adolphus surlily, 'I have more to do this morning than to listen to such stuff. I have to go to hear my doom from Claudia; and I came to the Albany just to steady my nerves by having some talk beforehand with a man of the world. I know it is absurd to feel put out by such a business. You would ask the question as calmly as if it were only to ascertain whether she were disengaged for a quadrille; and when refused, you would express mildly your desolation, and your good wishes for her happiness with another, look interestingly sad at her through your eye-glass, then inquiringly at the window to see whether it rained, settle your kids upon your wrist, pick up your hat from the floor, and saunter bowingly out of the room. Now I can't come it in that line—I'm not up to it; and Claudia has such a way of looking at one—she sees into your very marrow! I wish I hadn't been such a fool as to ask an interview; a letter would have answered the same purpose. You will at least walk with me to the door, and wait till I come out?'

'Yes, and I will give you a few hints as we go along.' 'What I want you specially to tell me is how to bring her to the scratch if she wants to fight off, with the excuse of her uncle's death, and so on. I must have the thing settled this morning, that I may run down to the Hall by to-night's mail-train. That beggarly vagrant, it seems, is to be off presently for Australia,

so that my last lingering doubts in that quarter are at an end, and the field is fairly open. I thought Sara looked sorry when we parted—didn't you?

'Yes,' said Fancourt musing—'come along.'

Lord Luxton and his daughter were at the time in consultation as usual, though on an unusual subject. It was far on in the forenoon before the young lady was visible; her father had had time to go out to hear the news, and he had made several business visits, and been to his club, before he returned. When he did return, however, Claudia was at her post. The tempest of the preceding day had swept away, and left her as calm and sunny as ever. More sunny: the light of her eyes, which yesterday morning was hot and feverish, was now a steady and exulting blaze. Her cheek, too, was a shade warmer than usual; and her father's anxieties respecting her were dispersed at the first glance. Still, he made no allusion to the scene that had taken place: he, in fact, was never at perfect ease with his daughter; there seemed to be something between their souls which rendered impossible the ordinary familiarity of such near relationship as existed between them.

'The crisis, Claudia,' said he suddenly, after the glance that reassured him, 'is more rapid than we supposed—all will be at an end to-night!'

'To-night!' and she flushed scarlet.

'Yes; the minds of ministers are made up. They will be beaten on a question not necessarily a vital one, and, in order to escape a worse overthrow, will take the opportunity of going out—in the confidence of being reelected ere long by a new parliament.'

'To-night!'

'This arrangement is secret. Everything will happen accidentally; up to the last moment they will be supposed to be as secure as a rock for some time to come.'

'That is well!' and her breath came freely. 'Then there is yet time: do you not know what is to be done?—you have to redeem your promise to Mr Oaklands! The appointment, although respectable, is only a stepping-stone, and a government in the position you describe will have no delicacy in filling it. But there is not a moment to lose; your claim, which, you know, they are prepared to allow, must be in the proper hands before five o'clock. Come!—and she hastily placed writing-materials before her father, and stood by his chair with her eyes rivetted on his.

'Upon my word, Claudia,' said the peer, 'I think you are too precipitate in this matter. The young man was extremely insolent to me yesterday.'

'To us, if you call it insolence. But his remarks were applied to the conduct of which he supposed us guilty, and would you give them force by making them true? Write at once—there is not a moment to lose!'

'I really do not know what conduct you allude to,' said the peer, with vexation: 'fellows in the position of Oaklands are more frequently than otherwise kept dangling for many years before being placed in independence for life. What is your interest in this young man? Why should I hamper government for him at a time like this, and by the very fact bind myself to their fortunes in opposition?'

'You hamper nobody, for you have received the promise of government, and they expect you to claim it; and as the reward is for service already performed, if it binds anybody at all, it is Mr Oaklands himself, and more to you than to them.'

Here a servant came in with a visiting-card: Mr Seacole was in the drawing-room.

'What do you mean to do here?' said Lord Luxton, when the man had withdrawn, and in a tone that shewed he was not sorry for the diversion—'the question is of more importance than the one we are discussing. Mr Seacole is far beneath the match to which

your station, personal appearance, and talents entitle you; but'—

'But, nevertheless, you would be content to see your daughter the wife of a small country squire, mean in abilities, undistinguished in person and in mind. You would have her chained down to a rank from which it would be impossible for her husband to rise, and where the noblest use to which she could put the talents you give her credit for would be

To suckle fools and chronicle small-beer!'

'You are bitter this morning, Claudia: but how is it that your humour passes over Mr Oaklands so indulgently? Does mere genius make up for everything in the world to which you have been accustomed? Do you consider his station or that of Mr Seacole the higher?' The peer spoke with asperity; but Claudia answered calmly.

'I consider his station,' said she, 'if he were once placed on a vantage-ground from which flight would be possible, to have no definite limit at all. The one is a country gentleman, and never can be more; the other may be anything to which ambition may impel, to which courage and resolve may lead, to which genius may soar. If I were his wife'—The peer started almost from his seat. 'Do not be alarmed, papa,' continued Claudia, with one of her most brilliant smile-flashes, 'we are talking, you know, only hypothetically. If I were his wife, I should not be satisfied with being the mistress of a little country mansion, and, if Heaven so willed, the grateful mother of a booby to inherit it! My husband's name would be heard in more than the divisions; his voice, though soft and melodious, would ring through the House, and be listened to like a trumpet by the nation; he would not follow his fortune, but make it what he willed—and what she willed, papa, who whispered in his ear, not counsels, but suggestions to receive the stamp of fate from his intellect; or who sat silent at his feet, and looked up—up—up to her husband as to a god!' Claudia did look up with her idolatrous eyes, and there was a nobleness in her expression at the moment which almost touched even the cold hard man of the world.

Can it be true that it is really woman's nature and destiny, as the Eastern apothegm asserts, to look up to somebody? If so, it might be easy to solve the mystery of Claudia's character, for till now she had never fallen in with a spirit at once stronger and purer than her own. She was too much behind the scenes in fashionable and political life, the only life she had ever known, to be deceived by its glitter and assumption. She had seen the actors off the stage, disrobed of that tinsel finery, and that rouge rubbed from their sickly cheeks, which had given them so much grandeur and beauty in the glare of the footlights. In Robert Oaklands she had beheld, for the first time in her life, intellectual power united with lofty principle; and not in contact—for here, alas, was the grand distinction!—with the low materialities of office and station.

'But come,' said she starting, 'let us turn for the present to the real and practical, for there is not a moment to lose. You must keep your word—you have now no excuse for breaking it, to say nothing of the dishonour; and the unexpected fulfilment even of a direct promise, will acquire a character of generosity sufficient to bind for ever to your interests an ally worth all the country squires in the kingdom.' It was with a very bad grace Lord Luxton consented; but his daughter had acquired a mastery over him which he could not resist, and he at length commenced the missive.

Claudia, in the meantime, proceeded to her interview with Adolphus, as if it had been part of the ordinary business of the day. Perhaps she was a little more abrupt than in ordinary business, for she could not trust implicitly to her father; and even while listening

to a proposal of marriage, her ears were engaged in the additional task of watching lest any unauthorised footsteps should pass down the stairs. The peer, however, proved to be a man of his word, for he knew whom he had to deal with; and he was all the more likely to be honest on this occasion from the circumstance of Claudia cutting the little affair she had on hand so short, that although it terminated in the way Adolphus wished, it was with a flushed face and an imprecation at the tip of his tongue he rejoined his friend in the street.

The note written by Lord Luxton was in the proper form; but when Claudia was determined to do a thing, she did it thoroughly, and in this case she added one from herself of a more private nature, and enclosed it in the same envelope. She then rung for Mr Slopper, whom she in some sort honoured with her confidence, as he was her ordinary attendant with the carriage, and committing the letter to his charge, gave him strict injunctions to deliver it immediately into the hands of him to whom it was addressed.

'Stay,' added she, 'there is still abundance of time; but if you choose to ride, there is money. Only take care for your life that no accident delays the delivery of this letter beyond five o'clock!' Claudia then bade her father good-by till dinner.

When Lord Luxton was alone, he brooded with growing vexation upon the circumstances in which he was placed. The conduct of Claudia seemed to him to border upon insanity; and so new was the idea of her forming an attachment entirely irrespective of interest and ambition, that he almost conceived it to be some morbid illusion dependent upon the state of her bodily health. But what if the young man—this young man who treats me with so much insolent contempt—does attain to the position from which she fancies he may arrive at greatness!—the idea that suggested itself here was so wild, that the peer started from his chair in terror. I will delay that letter, thought he, at all hazards, if it be still possible. Let five o'clock strike before it is delivered, and I am safe. Claudia herself, when she recovers, will thank me; and if she does not, she can hardly find much fault with so natural an accident. He rung.

'Send Slopper here.'

'He has gone out on an errand, my lord.'

'The other, then: I want to send after him.'

'He has gone out with the carriage, my lord.' The peer gave a growl of vexation. 'I think Mr Poring, my lord,' added the man, 'knows where Slopper has gone to.'

'Who is Mr Poring?'

'I beg pardon, my lord—Poring, Mr Seacole's man. He brought a note from Mrs Seacole, which he was to deliver immediately into Miss Falcontower's hand, and I heard him tell Slopper on the steps that he would follow and walk down with him.'

'Send him here.' The very man! thought Lord Luxton: he is the enemy of Oaklands—so Claudia said of his master, and, judging by the falsehoods respecting the fellow's origin, so say I of the man.

'You could overtake Slopper?' said he, when Mr Poring entered.

'I think I could, my lord.'

'He is carrying a letter to the Home Office, which, on second thoughts, I wish delayed a little. Perhaps I may speak to you on the subject again, for I want to make some further inquiry respecting Mr Oaklands before altogether committing myself in his favour. The letter must be delayed till past five o'clock. If you can manage this without mentioning my name to Slopper, so much the better, for all servants have not your discretion: but mention or not mention, the letter must be delayed. You may want to take some refreshment together—there is money.'

'Soh!' thought Mr Poring, as he strode more

rapidly than usual, but as noiselessly, down the stairs—'a sovereign from Lord Luxton!'—then the service is of consequence. And no names mentioned!—then it is confidential between me and him. And that Boy is to be kept out of the Home Office—that Boy as found me on the Common—and made an image of me in wood—and set Mrs Margery against me—and carried it on to this day, till she has refused to be the landlady of a house where the lower classes is not admitted, and kept by Mr Joshua Poring, in gold letters a foot long and more, with the mister left out. If Mr Slopper don't do as I would have him, I'll know the reason why!

Mr Poring walked with great strides, that answered to the running of an ordinary man, to the Chequers, in the immediate neighbourhood, but conveniently situated round a corner. The parlour was a good-sized room, with oblong tables parallel with the walls, of rich mahogany French polished. Each table was furnished with several circular slides for the beer-pots, also of rich mahogany French polished, and below, on the floor, an equal number of spittoons to match. The room was throughout clean, bright-looking, uniform, and to Mr Poring's thinking the very moral of a parlour where the lower classes is not admitted; but on the present occasion, indulging in only a single sweeping glance, he went up to the mantle-piece, and took the trouble to put back the clock a considerable portion of an hour. On turning round he found that he was not alone. An individual was sitting in a corner behind the door, dozing over the morning paper, and turning a dreaming unobservant eye upon the operations of Mr Poring.

'Mr Driftwood!' said that gentleman—'glad to have the pleasure of seeing you. We are slow in this house, I think—by me,' and he drew forth, by a handsome mosaic chain that looked as well as gold, a silver watch.

'I don't know,' replied the artist; 'my rascally boy has taken mine to clean, and I could not get hold of him this morning to ascertain where it is. Mr Slopper was asking for you just now.'

'And is he gone?' said Mr Poring, starting.

'No, here he is.' Mr Slopper hereupon entered with a small pewter measure of a colourless liquid, and a single shallow glass.

'That won't do, Mr Slopper,' said Mr Poring; 'it is some days since we have drunk together, and I vote for a couple of regular tumblers of cold without—at my expense.'

'I'm obleeged, Mr Poring,' replied Mr Slopper; 'but I must be at Downing Street before five, and it ain't the thing to walk fast: it don't look well in us who is used to carriage exercise.'

'No more it don't; we must draw a line, as you say; but you see you couldn't spin it out to half-past four, if you was to crawl like a fly in treacle, and I want to talk to you about a house I'm a-thinking of.' Mr Slopper, on turning his eyes to the clock, was surprised to find it so much earlier than he had supposed; and accordingly the little measure was exchanged for two goes of cold without.

But the eyes of Claudia were upon her messenger: they rarely left him indeed till her high behests were accomplished, and on this occasion she had been more emphatic in her orders than usual. He was to beware of accident for his life; these were her words, and although he did not exactly fancy that he ran any risk of a violent death in the event of failure, the penalty seemed to his imagination, from its very shapelessness, to be quite as bad. He accordingly drank his gin and water with great gulps, and got up before Mr Poring, who was in an uncommonly affable and comfortable humour, had half finished his.

'Well, Mr Slopper,' said the latter, when he found that everything else was in vain, 'I think you will sit down and be agreeable, and let me call for another,

when I tell you that I have only been going a little game with you. The fact is, the letter is in favour of that Boy—him they call Oaklands'—

'I know that, Mr Poring; do you think I haven't both eyes and ears for what is going on, more especially when people is in a flurry and speaks like actors on the stage?'

'Well, well, but you see his lordship, on second thoughts, wants to make some more inquiry first; and so he said to me, says he, Mr Poring, if you would be so obliging as to go after Slopper, says he, and stop the letter for an hour or two, till after five, says he, I should take it kind. In course I replied affably, and there's no more about it.'

'Ay, but there is!' said Mr Slopper, settling his hat on his head. 'You don't know nothing, Mr Poring, about the political conundrums of our family—of what we call the balance of power. Lord Luxton! Pooh, pooh! Our miss is worth two of the governor any day; and it was her who told me not to be later than five o'clock for my life!—So if you'll walk, thank ye; if not, I have the honour'—

'You are an ignorant person, Mr Slopper,' said Mr Poring, rising with dignity; 'you can know nothing about the Sally-law, or you would not talk of a gal being worth two of a lord. Since you won't attend to the head of the family what pays you your salary, give me the letter!'

'Give you the letter! Here's a go! My eye! I wouldn't give the letter to his lordship in person without the orders of Miss.'

'Don't put me to taking it from you, Mr Slopper, for I should be sorry to hurt you: but you see, I have promised Lord Luxton, who has a right to order what he pleases about his own letters, and I mean to keep my promise.'

'Come, come, Mr Poring, no nonsense of that kind. Hurt me! Why, I could tie a knot on you any day, for as stiff as you are;' and the two men approached close to each other, Mr Slopper flushed and indignant, and Mr Poring imperturbably calm.

'What does it all mean, I say,' said the former, 'are you a-going to rob me?'

'I'm a-going to punch your head presently, if you have spirit enough for it.'

'I have spirit enough to serve your turn, and a good few to spare. But I won't have no punching of heads—the chest must do the business. I couldn't afford it. Miss likes everything that's handsome; and she wouldn't on no account have me looking at her with an eye that seemed as if blowed up with gunpowder, and a cheek like a monkey's with a couple of walnuts in it.'

'You are right,' said Mr Poring candidly, 'blackened eyes is gone down to the lower classes. You are a thoughtful and respectable man, Mr Slopper; and I'll punch your chest and stomach, and have a try at your collar-bone, and we'll see what comes of it.'

'Gentlemen, gentlemen!' cried the landlord, hurrying into the room—'surely this is not friendly! Would you make a row in my very parlour, and endanger my licence?'

'But it's honour, Mr Jolter—what are we to do?'

'Why, if you must go to work, isn't there the yard? How could I know anything about it if two gentlemen chose to meet promiscuous in the back settlements, and if Jim the potboy picked up one of 'em, and Taproom Tom dandled the other? But go out separate, and turn away your flushed face, Mr Slopper, when you are passing the bar.' The advice was taken instant; and no wonder, for Mr Jolter looked like a stout justice of the peace, and his hat might have covered handsomely any number of thousands a year you could name.

Jim, the potboy, was a little old man, lame, but able-bodied. He had never been anything he could

remember but a potboy at the Chequers, and was regarded as one of the fixtures. Taproom Tom, who presently made his appearance, with a dirty towel under his arm, had been for many years in the situation of a servant out of place. He was dressed in a faded livery, consisting of a green cutaway-coat, reaching below the calves of his legs, with yellow facings, knee-breeches of no colour in particular, and white neckcloth and stockings in a state of chronic dirtiness, that had never been known to change either for better or worse. Tom succeeded about once a year in obtaining a place, but kept it only for a few days, when he was discharged for fighting in the kitchen; upon which he drifted back naturally to the Chequers, where he served in the taproom from taste, and was much liked on account of his quietness and civility. It was tacitly understood that he was to get a plate of victuals now and then from the house, and be permitted to drink as often as the guests invited him; so that, upon the whole, Tom did not lose much by the loss of his place.

But these two were not the only spectators who had assembled. It is surprising how information of an interesting nature percolates. The back-wall of the yard was very soon swarming with coachmen and stablemen from the mews behind; several gentlemen's servants were shewing their heads above the side-walls; and from all a buzz of criticism arose when the combatants stripped, or, in technical language, peeled to the waist. Mr Slopper was a well-coloured man, in comfortable condition, but not flabby. He had some good flesh and blood covering his bones, and looked as if he would take a considerable quantity of mauling before you got well into his ribs. His hands, however—termed by the learned of a former day bunches of fives—were the grand feature. They were immense hands; and when doubled up and wielded by a tall stout individual like Mr Slopper, appeared to be fit to bring down an ox. Mr Poring was a spare, angular man, of a bluish-gray colour. He looked like a porringer you might break but couldn't bruise; and being apparently built, like a Chinese-junk, in compartments—probably square—even if broken, it would be only a local chip, not a general smash. Five to four on Poring, and takers shy.

The battle, although exciting to the critical spectators, would hardly awaken much interest in these pages; and more especially, as it was prolonged interminably by the slowness of Mr Poring. When Mr Slopper came down, which he did several times, he sat only for an instant on the motherly knee of Jim the potboy, and was on his legs again like a good one; but Mr Poring never could be prevailed upon to front him till time was just on the eve of being up. At length that gentleman—who had been chipped in almost all his compartments—received a mighty punch full on the pit of the stomach which, for the first time, brought him down like a steeple: and he sat for a moment, as unconsciously as a baby, on the knee of Taproom Tom, who held him with the tenderness of a wet-nurse. At this moment a church clock struck, and Mr Poring sprang up, with a grin half of pain half of triumph.

'It is five o'clock, Mr Slopper!' said he, 'you may take your letter as soon as you please. I don't want no more of this—do you?'

'I'm obleeged, Mr Poring,' replied Mr Slopper; 'and since you are satisfied, so am I. As for the letter, it is in the proper hands by this time, I have no doubt—per favour of Mr Driftwood!' Mr Poring looked as if he would have sunk again into the arms of Taproom Tom; but collecting himself, he put on his clothes, and walked his aching bones off the field of battle. Mr Jolter, without making any allusion to the scene in the yard, presented the two gentlemen as they went out with a glass of brandy, of which Mr Slopper declared himself much the better; while Mr Poring emptied his glass without uttering a word, and walked

stiffly homewards, looking as if he was discoursing inwardly in the strain of our army in Flanders.

He would have been somewhat comforted, however, had he known of Mr Driftwood's adventures. The unfortunate artist, in his generous eagerness to serve his friend, after walking some distance, became nervous as to time, and called a cab. The horse was slow, the cabman crusty, and to complete the calamity, a Teetotal procession thought fit to block up the street for a considerable time. Driftwood jumped out in despair, dived into the crowd, and like Milton's fiend,

With head, hand, wings, or foot, pursued his way.

He was at length at Charing Cross; he was beyond Whitehall; a clock struck with a deep sonorous tone—Oh, to see the dial of the Horse Guards!—but it was hidden by the projecting parts of the building, and he could only count the strokes, his heart sinking at every clang: one—two—three—four—five!

### COLONIES IN LONDON.

STRANGERS and temporary visitors in London are given to divide the huge Babylon into two great sections, which, under the general denominations of the East End and the West End, are supposed to represent—this, the world of wealth, of aristocratic descent, of high breeding, and of fashion; that, the world of commerce and industry, and of unfashionable struggles for competence and independence, or the bare necessities of life. Such a general division is convenient enough for common purposes; but in both the hemispheres, if such they may be termed, of the great metropolitan world, there are numberless distinct and separate classes and orders settled down among the indiscriminate mass of population, with whom they mingle only to a certain extent, and who are as plainly discernible by the man of observation, as any other of the social phenomena which give its peculiar character to the Great City. These classes and orders, it will suit our present purpose to designate as colonists—and such they may be regarded in several points of view. Most of them have come to town, urged by the same impulse which weekly drives thousands to the diggings of California or Australia. Their object being the same as that of the general army of workers, it would seem strange that they do not become speedily fused in the mass, and undistinguishable from them: such, however, is not the case. From some cause or other, or probably from many causes operating together, there is a sort of clan-like tendency, not always to be accounted for on the principle of mutual interest or mutual support, which congregates the emigrants from specified distant localities, the professors of certain arts, or the workers at certain trades or species of labour, in districts which they, in a manner, appropriate to themselves from one generation to another.

The most remarkable colony in all London is no doubt that of the silk-weavers, who, driven over here by the revocation of the Edict of Nantes, have monopolised a portion of the area of Spitalfields for a period of 160 years. Their clanship, however, is owing to causes sufficiently obvious, and needs no explanation. Let us glance now at some of the many associated tribes whose circumstances and antecedents afford no such reason for their isolation, more or less complete, from the masses amid which they dwell.

Scattered here and there among the more modest of the approaches to G—Square, will be found a colony of respectable tradesmen, whose foreign names glittering in gold letters over their shops, proclaim their continental origin. Their broken English, lisped in bland whispers, and their extravagant politeness of gesticulation in the presence of an aristocratic customer, there can be little doubt, serve as excellent auxiliaries to

trade. The bulk of their business lies with the upper classes, and they supply well-nigh the entire demands of the household, and likewise no small profusion of luxuries for the table and adornments for the person. Their first floors, during the season, are the abodes of provincial members of parliament, and the younger brothers of the aristocracy—captains in the Guards, and embryo nabobs in course of rustication—fortune-hunting adventurers, polite gamblers, and diners-out of the loftiest grade. Their attics are the studios and sanctums of unknown artists, rising professors, and the neophytes of dental surgery and chiropodal science: and in their garrets lie up in ordinary a whole regiment of valets, couriers, dragomans, butlers, stewards, and gentlemen's gentlemen, with their indispensable collaterals of the *beau sexe*, all from La belle France, Fatherland, the hills of Switzerland, or the plains of sunny Italy—and all waiting, with such patience as dwells in the hearts of exiles, till a new patron shall engage their invaluable services. Who are these respectable housekeepers who exercise such comprehensive hospitality, and thrive so well under the genial smile of Old England's nobility? Shall we be guilty of any breach of etiquette or good faith in revealing a fact which, so far from being a discredit to them, exalts them into an example to others? They are almost to a man the discharged servants of the travelling aristocracy, brought hither by their masters, by means of whose liberal and well-deserved patronage and recommendation, they are on the road to competence. They offer a curious contrast to the retiring English manservant, who, if he invest his savings in business at all, is pretty sure to do so in the purchase of a public-house, but who has too often no savings to invest in anything.

Not far from the above provident colony, but nearer to the supposed boundary-line separating the two worlds of East and West, we come upon a quiet district, where fashion does not disdain to be seen either in equipage or on foot, where dwell in amicable juxtaposition the working, but not the exhibiting, professors of those arts and accomplishments in which fashion must excel or cease to be. To play upon the guitar, to fence, to speak in polyglott, to enunciate bravuras or buffas to a miracle, it is necessary to become the *élève* of Senhor Fernando, of Monsieur Angelo, of Herr Vielsprach, of Signior Sallado. These pilous, pale-faced, and dark-eyed gentlemen are to the intellect of fashion what the milliner and tailor are to its bodily shape; they bedeck and adorn it *a-la-mode*, and render the inner man or woman presentable in select circles. The spirit of rivalry, never so rampant with professors as with men of commerce, seems almost unknown to this order of continental settlers among us. They are invariably friendly with each other—Englishmen of the same class being as invariably estranged, if not hostile—and are often known to refuse a pupil discontented with a brother professor, and to allege as a reason that they cannot themselves boast of superior qualifications.

A different colony of foreigners—for the most part—is that which radiates round a circle, of which the Great Globe in Leicester Square is the centre. It would take ten times the space that we propose to occupy in this paper, to set forth the extraordinary merits of the multi-faced and multi-moustached tribe who have settled down in this neighbourhood, as in a spot affording peculiar facilities for the practice of a species of industry better described in the vocabulary of the swell-mob than in that in common use. Here and whereabouts are to be met with the fugitives who have fled from the police of half Europe—the scum and offscourings of Paris and Berlin; the scamps of Rome and Madrid and Vienna; the 'posted' cheats of Baden-Baden; the swindlers of all nations mingled together with the most dashing desperadoes of our own, who,

assuming the garb and the language of foreigners, swagger in masquerade before the eyes of the myrmidons of justice, and defy detection. They may be compared to a shoal of sharks ravenous for prey, and ready at any moment to rend in pieces any unfortunate voyager silly enough to trust himself to the seductions of the elements in which they move. They were once the recognised and privileged jackals of the numerous hells which skirt the western limits of their lair; but, from some cause or other—probably because there was too little of the jackal, and too much of a roaring lion in their composition—they have been unanimously kicked out of Pandemonium, whose golden gates are now barred against them. That, however, matters little: let but half-a-dozen of them meet together, and there is a hell, with Mammon in the midst, and Moloch not far off. Divested of all that makes humanity human, they trample scornfully upon its tenderest ties and most sacred obligations; they make a mock of ruin, and a jest of death. In their vocabulary, despair, and suicide, and perdition are resolved into slang phrases, provocative of such mirth and such laughter as would make innocent gaiety shrink aghast with horror. The honour that dwells among thieves is banished from their brotherhood: in default of victims from without, they betray and rifle each other, and no man is fool enough to rely upon his fellow. Their career is probably brief enough; but their ranks are supplemented by the victims they sacrifice, who become in their turn the relentless ravagers of fresh prey; and their calling is, moreover, the last refuge of every desperate dare-devil to whom the means of luxurious and sensual indulgence is the breath of life.

Let us turn to another foreign colony of a more pleasing aspect. On various parts of the beaten track in which commerce chiefly runs, are situated the well-known Arcades, the several shrines to which the London children make such constant and such willing pilgrimages. These are mostly inhabited by Germans and French, the former in the greatest number. Marvelous museums they are, especially to infant girls and boys. Every shop is a mountain of wonders, and there is a whole chain of mountains on either side of the way, so that the spectator walks in a literal ravine of toys and knickknacks, and useful and ornamental implements. This colony is the very antithesis of the last described. Here we see ten thousand evidences of patient and unwearied industry, united occasionally with no small amount of artistic talent, employed in the unremitting endeavour to earn the smallest pecuniary guerdon ever bestowed upon labour honestly exerted. Here are the results of the long winter-nights of the peasant-shepherds and cattle-tenders of the Black Forest, visible in elaborate, and often very clever carvings of wild or domestic animals, a whole flock of which may be bought for a trifling sum. Here are musical instruments good enough for the tyro, honestly made and scientifically tuned, to be had for the small sum that lingers in the school-boy's pocket after stuffing at the confectioner's, or for the 6d. or 9d. which the errand-boy saves out of his weekly wages; and besides all that delights and fascinates the eye of childhood, is a long catalogue of articles in hourly use, fashioned in a style that puts our home-manufacturers of such trifles to the blush, and sold at a price at which they cannot yet compete. Lying out of the swarming thoroughfares in retired and covered spots, these repositories of everything useful, amusing, and cheap, have gradually made a reputation for themselves, and would be sought out and encouraged were they to migrate from their present appropriate quarters, and pitch in any part of the city. It may be that but few of this class of colonists sleep among their multitudinous gatherings, and that they have their homes elsewhere; but the Arcades are their colonial settlements.

We need do no more than advert to the German sugar-baking colony which has taken possession of a

part of Whitechapel, where their places of worship have sprung up around them, and where they preserve their language and many of their Fatherland customs in the midst of strangers. The Italian colony of music-grinders and image-boys which congregates amid the slums of Leather Lane and Liqueurpond Street, is also tolerably well known to the observer of London-life, and demands no description at our hands. The Jews, too, who colonise every country under the face of heaven, and who in London principally affect the region of St Mary Axe and the tributaries of Houndsditch, but who are to be found wherever money is to be made—and who, with still greater certainty, are not to be found where nothing is to be got by attendance—may on this occasion be passed over, while we turn our attention for a moment to one or two of the industrial colonies of our own countrymen which may be found worthy of a passing notice.

The first of these that suggests itself is the old brokers' colony of Broker Row, running from Drury Lane towards the Seven Dials. Until within the last few years, such another collection of chairs, tables, beds, bookcases, wardrobes, carpets, floor-cloths, desks, drawers, going clocks and gone pianofortes, was not to be met with in the whole circumference of the metropolis. There are now, however, rival colonies of the kind, though none in all respects so complete or venerable. A passing stranger might imagine that these roomy receptacles were merely shops for the sale of second-hand goods: if, however, he have occasion to explore one of them in search of any commodity coming under the denomination of furniture—and no matter what it is, he will be sure to find it—he will come out with a different notion. It may chance that he will be led through a wilderness of chambers, ranging from cellar to roof, each crammed to the ceiling with every variety of manufacture into which mahogany can be shaped; and he will have carefully to sidle his way towards the desiderated article, which perhaps lies buried ten feet deep under a complication of legs, wings, rungs, and flaps, through which he is politely requested to take a telescopic view of it, 'because it ain't no use my pullin' of it out if so be you don't think o' buyin'.' In one or other of these rooms, perhaps in several, he will find one or more superannuated cabinet-makers' journeymen, themselves much in need of repairs, busy with saw, plane, glue-pot, and French polish, patching up and turning out as new for the fiftieth time articles that were worn out last century. In London, where every hobbyhorse is ridden full gallop, odd tastes and predilections are indulged, such as are scarcely heard of elsewhere; one of these we take to be the passion for second-hand goods. There is a class, a very small minority, it is true, to whom novelty is an abomination, and who will not submit to it, if it is to be avoided. An occasional visit to Broker Row is indispensable to persons of this class, who appear to value their household goods in the ratio of the household labour bestowed upon them. They regard French polish as an imposture, and prefer paying a round price for an article fifty years old because it has had fifty years' elbow-grease to boast of. On our remarking lately to a tradesman in this locality, that he was extravagant in the article of oil-cloth, having laid it down wherever it was possible to find room for it—'Sir,' said he, 'I sell three times this quantity in a year, but I never sell a yard new. I buy it new, and lay it down here for a few months to take the shine off, and sell it at a good profit afterwards.' The brokers' colony is probably a real convenience to the public, who, when in haste to furnish, may do so without the pains of wandering far and wide in search of the materials.

Analogous to the above in some respects is the colony of doers and undoers and dealers in pictures, who, for the last forty years at least, have held almost undisputed

possession of W— Street and its adjacent precincts stretching away beyond Soho. How many times Titian has been skinned, Jordaens pumice-stoned, and Rembrandt baked in this shabby Walhalla, let the officiating ministers declare if they will. They are a remarkably candid and simple-hearted set of men, and exceedingly communicative on matters of art—but fallible sometimes, like ordinary mortals, and liable to make trifling mistakes in the allocation of proper names—so that it may be wise to verify their dicta now and then by corroborative testimony. They are the true and potential Spirit-rappers of the day: the dead-and-gone geniuses of the buried ages wait at their beck and are obedient to their summons. Raphael himself must respond if the W— Street Medium cite him to his bar; nor dares Michael Angelo refuse. Under their talismanic influence, the sepulchred favourites of pope and cardinal astonish the world of to-day with fresh marvels of art, never seen before, yet palpably cracking and crumbling beneath the touch of time, till armed to defy his scythe by applications of modern skill. The world of London, and indeed of all England besides, owes an immense deal to W— Street. But for the considerate ministrations of its disinterested denizens, how many private galleries throughout the country, now rich in specimens of the Italian, Spanish, and Flemish masters, had wanted even a single sample of the great schools! Nor are the dead artists themselves less beholden to them, seeing that but for their supernatural powers of multiplication, many a modest genius whose fame might never have extended beyond the confined district that gave him birth—or the pages of Pilkington—now enjoys an English reputation, and hangs in honourable company (if by proxy, what matter?) beneath many a lordly roof. Time was when the colonists of W— Street wanted in wealth, when purvey ignorance, seeking enlightenment in the liberal arts, paid generously for the practical lessons it received—but the glory of the place has been latterly under eclipse; a spirit of vainglorious conceit has got possession of the students and connoisseurs of art, who, affecting now to be as wise as their teachers, disburse but charily for the few hints they condescend to receive. May the colony be restored to an honourable standing, and thrive henceforth as it deserves!

Away to the river-side, shadowed with the hulls and masts of vessels—not to that amphibious colony which, lining both banks, takes in Stepney and Rotherhithe, Wapping and Deptford, where all that greets the eye and the nose 'doth suffer a sea-change'—but for a glance at the colony of coal-whippers, whose history claims a brief notice here. The millions of tons of coal which London periodically consumes, are served out to the public by the agency of the coal-whippers, who have pitched with their wives and families along the margin of the Thames, where the colliers are moored. They are a stout and brawny race, who look upon two hundredweights as a sort of natural knapsack not to be grumbled at. They are from no particular district, but selected, for muscular reasons, for the performance of a species of labour to which every gentleman is not competent. They have stringent laws for the regulation of their industry, which, though it is of a very repulsive description, is more than usually lucrative; and it is rare indeed that a man once fairly entered in this profession ever leaves it willingly, so long as he is capable of doing the work. They are, however, too many of them, fanatics in their devotion to beer; and their zeal in the cause of Sir John Barleycorn betrayed them and their affairs into the power of the publicans, who, for many years, virtually managed their entire concerns, receiving and paying their wages, and engaging or discharging their services as they chose, and, of course, displaying that disinterestedness which is the publican's characteristic. With the priest of the hoghead for a paymaster, and

with wages more than doubly sufficient for a poor man's household to receive, the coal-whipper soon grew into a mere drinking-machine—a walking, staggering conduit for treble X. If, from any cause, his powers of imbibition relaxed, he ran the risk of sudden discharge; a fit of sobriety was an unpardonable act of treachery, and avenged with summary ejectment. Nay, a mere gallon-man, whose puny thirst was slaked with eight pints a day, was hourly in danger of being supplanted by any candidate who was blessed with the capability of swallowing sixteen, and was discharged, too, when the double-gallon man sued for admission to the ranks. The merits of the labourer were measured by the capacity of his throat; and he who could carry coal under the most liquor ranked first in the scale. This truly infernal system was maintained in operation for many years, to the ruin of numbers of its victims, and the misery of their families. The plundered party at length found courage to petition the legislature; and after the customary course of committees and blue-books, an act was passed emancipating them from the oppressive sense of obligation under which they laboured, and leaving them at liberty to pay their vows at their favourite shrine at their own freewill.

We find ourselves in danger of exceeding all reasonable limits by extending our colonial survey—and though there are other town colonies which would repay the trouble of a brief inspection, we can but hint at a few of them, which the reader can explore for himself when the opportunity occurs. There is the publishers' colony in Paternoster Row, of which all the world knows something at least. There is the aristocratic colony of Belgravia, of which the greater part of the world know very little, and where those who want practical information may hire a very comfortable house for a trifle of L.2000 a year, and be in a condition to make observations on the spot. Not far from it there is a thieves' colony in Westminster, where a peripatetic practitioner may find accommodation for a less sum than it costs the Belgravian to keep his knocker clean. There is a colony of clubs in St James's, and a colony of bludgeons in St Giles's and White-chapel. There are several colonies of lawyers in quiet retreats which litigants are perfectly familiar with; and there are various small colonies of students and scholars grouped round hospitals, colleges, and the university. There is the stockbrokers' colony near the Exchange, and the stage colony in Capel Court. There are shipbrokers' colonies along the river's brink, and colonies of outfitters on Tower Hill and all round the docks. There is Mincing Lane colony, and Mark Lane colony, and the Custom-house colony—each characterised by separate and distinct species of the money-getting genus. There is a colony of artists in the region of Newman Street and Rathbone Place, and a colony of jewellers in Clerkenwell. There are trade colonies without number, where birds of the same feather, artisans of the same craft, flock together as to a market for labour; and, lastly, there is an indefinite number of little provincial colonies, assembling only at night in public-houses, where the news from 'home, sweet home,' may be read in the Falmouth local journal or the gazette from Northumberland, and be discussed by the listeners in the long-remembered dialect of their native places. These country inns, if we may so call them, are generally kept by emigrants from the provinces, and serve to keep alive a sort of clannish feeling, and to preserve old associations and friendships among inhabitants of the same place. In this way, nearly every county in England, and most of the large towns both in England and Scotland, are represented in London.

We are not aware that in any other capital in Europe such a remarkable result of the gregarious tendencies of human nature could be found as the metropolitan colonies exhibit. Much of it, no doubt, could be traced to the obstinate class-feeling for which

England is proverbial, and which foreigners, not altogether without reason, regard as a blot upon the national character; but more of it, we are inclined to think, originates in necessity or self-interest, and is the fruit of that experience which has taught the Londoner how he may best minister to both. The phenomenon is one, at anyrate, upon which it is not uninteresting to speculate.

### THE NIGHT OF THE POETS.

POETS are a sort of interpreters of nature, seeing what others see not, and understanding what totally escapes the comprehension of their neighbours. One of their propensities is that of strolling abroad when the rest of the world are at supper or in bed, to watch the singular aspects of the night, which appears to have been originally made for their especial use and pleasure. We mean to interrogate these wanderers in darkness, in order, if possible, to discover what the notions are which they entertain of the ebon goddess. If egotism were permitted to persons writing in prose, we would say that we ourselves have a peculiar theory about her, which it may not be unpleasant to compare with that prevailing among the children of the Muses.

Most persons, whether they acknowledge it or not, experience a sort of uneasy sensation when left alone with the night. The reason is, that nature has not bestowed upon them that particular sort of lamp which, like the cat's eyes, enables a few favoured individuals to stroll perfectly at their ease over the surface of the earth, in the absence of the sun and moon. It is no merit of theirs that they feel no fear in what is darkness to others. For them, the world contains no such thing as darkness; they can always see well enough to discover the soft, placid, meek features of Night, who throws aside her thick veil to amuse them, and, opening her large tranquil eyes, enables them to look at will into the very depths of her soul. Instead of pitying them, therefore, we should rather envy them their profound delight when, taking leave of gas and Price's composite, they roam away with the eldest sister of Chaos into the glimmering fields.

Half the enjoyment we experience on such occasions depends, however, upon two things, which, unhappily, are not always in our power: we mean a balmy atmosphere and wild and romantic scenery. We are almost tempted to add a third condition—rich and musical names, steeped, if possible, in historical associations. There are some syllables so crabbed, so tough, so inflexible, so vulgar, that the whole nine Muses, if they were set about it in concert, would not be able to domiciliate them in the world of poetry. There are others which of themselves, wheresoever and by whomsoever pronounced, make at once a picture upon the mind—Verona, Fiesol, Vallambrosa! Do they not sink in liquid softness upon the ear, and slide, we know not how, into the soul, rippling and overshadowing its surface like the west wind, when perfumed by the breath of violets in spring?

With respect to night-landscapes, it may be predicated generally, that they are infinitely grander than any we behold by day. Even the most common-place city, when its noises have been stilled and its thoroughfares cleared by the darkness, presents a succession of striking pictures to the fancy, as we wander through it. But in the gorges of mountains, in rocky glens, in forests, and among cliffs and precipices, on the seashore—if favoured by the moon streaming upon through rents in the clouds—we see the earth invested with a splendour and magnificence which even poetry, with all its resources, fails adequately to represent.

But let us not murmur because there are things in nature which surpass the imitative powers of art. The poets have done much to give permanence to the

fleeting beauties of the night. Let us accept the offerings which they have poured into the treasury of fancy, and examine them one by one, as chance brings them to our hand. Coleridge, it may be presumed, from the dreaminess of his character, was tolerably well qualified to draw sketches of Nature, when, with starry diadem and mantle of sable, she walks the world in majesty.

'Tis the middle of night by the castle clock,  
And the owls have awakened the crowing cock;

The night is chilly, but not dark;  
The thin gray cloud is spread on high,  
It covers but not hides the sky.  
The moon is behind and at the full,  
And yet she looks both small and dull.  
The night is chill—the cloud is gray:  
'Tis a month before the month of May,  
And the spring comes slowly up this way.

In this passage, there are perhaps more suggestions than pictures. Superstition was a large element in the imagination of Coleridge. He was essentially unclassical. All the poetry of his nature was connected by imperceptible links with the indefinite mythology of the north, and hence, perhaps, the strong hold he possesses over the minds of the English people. He is not content with delineating the external features of heaven or earth, but appears to draw aside a corner of the material veil, and afford us glimpses of the ideas which revolve through the obscurity behind it. Some indications of this are discoverable in almost every passage in which he speaks of the night. Thus in the *Ancient Mariner* :—

We listened, and looked sideways up;  
Fear at my heart, as at a cup,  
My life-blood seemed to sip.  
The stars were dim, and thick the night,  
The steersman's face by his lamp gleamed white;  
From the sails the dew did drip—  
Till clomb above the eastern bar  
The horned moon, with one bright star  
Within the nether tip.

And the coming wind did wax more loud,  
And the sails did sigh like sedge;  
And the rain poured down from one black cloud;  
The moon was at its edge.

The thick black cloud was cleft, and still  
The moon was at its side:  
Like waters shot from some high crag,  
The lightning fell with never a jag,  
A river steep and wide.

The loud wind never reached the ship,  
Yet now the ship moved on!  
Beneath the lightning and the moon  
The dead men gave a groan!

Of the *Ancient Mariner*, the informing principle is superstition; but in others of Coleridge's pieces we find descriptions of the night without this accompaniment.

Mild splendour of the various-crested night!  
Mother of wildly-working visions! hail!  
I watch thy gliding, while with watery light  
Thy weak eye glimmers through a fleecy veil;  
And when thou lovest thy pale orb to shroud  
Behind the gathered blackness lost on high;  
And when thou dardest from the wind-rent cloud  
Thy placid lightning o'er the awakened sky.  
Ah, such is Hope! as changeful and as fair!  
Now dimly peering on the wistful sight;  
Now hid behind the dragon-winged despair:  
But soon emerging in her radiant might,  
She o'er the sorrow-clouded breast of Care  
Sails like a meteor kindling in its flight.

It has, of course, been often remarked, that in nearly all the later poets, whether of Germany, France, or England, there prevails an air of melancholy, which infuses itself into their descriptions of nature, and imparts to them a sadness belonging in no degree to the originals. Into the philosophy of this subject we cannot here enter; but it may be observed by the way, that our civilisation has not hitherto proved either to society or to individuals the cause of so much happiness as seems from the first to have been expected. Profound discontent pervades a large portion of the thinking classes, and this feeling necessarily tinges the whole system of their ideas. Among our ancestors, as well as among nearly all ancient writers, there is far greater vivacity, playfulness, joy, and contentment. Their poetry, consequently, overflows with exhilaration, and puts people in good-humour, as well with things in general as with themselves. Let us, by way of illustration, select a moonlight scene from Shakespeare:—

*Lorenzo.* The moon shines bright: in such a night as this,

When the sweet wind did gently kiss the trees,  
And they did make no noise; in such a night,  
Troilus, methinks, mounted the Trojan walls,  
And sighed his soul towards the Grecian tents,  
Where Cressid lay that night.

*Jessica.* In such a night  
Did Thisbe fearfully o'ertrip the dew;  
And saw the lion's shadow ere himself,  
And ran dismayed away.

*Lorenzo.* In such a night  
Stood Dido with a willow in her hand  
Upon the wild sea-banks, and waved her love  
To come again to Carthage.

*Jessica.* In such a night  
Medea gathered the enchanted herbs  
That did renew old Æson.

*Lorenzo.* In such a night  
Did Jessica steal from the wealthy Jew;  
And with an untrifling love did run from Venice  
As far as Belmont.

*Jessica.* And in such a night  
Did young Lorenzo swear he loved her well;  
Stealing her soul with many vows of faith,  
And ne'er a true one.

*Lorenzo.* And in such a night  
Did pretty Jessica, like a little shrew,  
Slander her love, and he forgave it her.

Bring your music forth into the air.  
How sweet the moonlight sleeps upon this bank!  
Here will we sit, and let the sounds of music  
Creep in our ears: soft stillness and the night  
Become the touches of sweet harmony.  
Sit, Jessica: look, how the floor of heaven  
Is thick inlaid with patines of bright gold.

Our great dramatist, as is well known, abounds with exquisite touches, which may suffice to suggest glorious images of the night; but he has nowhere indulged in anything like a finished picture. Where the lines occur, they are often full of beauty; but, separated from the context, and strung pell-mell together, they would scarce appear to do justice to the poet's thoughts. Yet they are always fresh and fragrant, and prolific of suggestions. For example:—

*Lysander.* Helen, to you our minds we will unfold.  
To-morrow night, when Phoebe doth behold  
Her silver visage in the watery glass,  
Decking with liquid pearl the bladed grass  
(A time that lovers' flight doth still conceal),  
Through Athens' gates have we devised to steal.

Few poets, whether ancient or modern, have yielded themselves up to the fascinations of night more than Shelley. The too penetrating light of day disclosed to his melancholy eye more of the world's misery than he could bear to contemplate without anguish. He loved above all things, therefore, to steal forth and pursue

his thoughts in darkness. The crimes and irregularities of society were hidden from him then, while multitudes of brilliant and gorgeous fancies swept before him in endless and ever-varied processions:

How beautiful is night! the balmy sigh  
Which vernal Zephyrs breathe in morning's ear,  
Were discord to the speaking quietude  
That wraps this moveless scene. Heaven's ebon vault  
Studded with stars unutterably bright,  
Through which the moon's unclouded grandeur rolls,  
Seems like a canopy which love has spread  
To curtain her sleeping world. Yon gentle hills  
Robed in a garment of untrodden snow:  
Yon darksome rocks, whence icicles depend  
So stainless that their white and glittering spires  
Tinge not the moon's pure beam: yon castled steep,  
Whose banner hangeth o'er the time-worn tower  
So idly that rapt fancy deemeth it  
A metaphor of peace—all form a scene  
Where musing solitude might love to lift  
Her soul above this sphere of earthliness:  
Where silence undisturbed might walk alone,  
So cold, so bright, so still.

If we could perseveringly follow each poet through all his delineations, we should find in him a peculiar version, so to speak, of the night. Doubtless, every man paints whatever he looks at with the colours of his own idiosyncrasy. Nothing comes to us in its own inherent qualities, but simply as it appears to particular observers. Shelley had lived among the Alps, whose aspects and features he carefully studied, and sought frequently to paint. In *Alastor*, therefore, when we appear to be transported to the wildest solitudes of the Asiatic mountains, we are only placed among the rocks and glaciers, the chasms and waterfalls, the icy pinnacles of the Great St Bernard, Mont Blanc, or the Jungfrau:

At midnight  
The moon arose: and lo! the ethereal cliffs  
Of Caucasus, whose icy summits shone  
Among the stars like sunlight, and around  
Whose caverned base the whirlpools and the waves  
Bursting and eddying irresistibly,  
Rage and resound for ever.

In another poem, our fancy is again turned away to terrific solitudes, haunted by the spectral moon, whose rays are intercepted by exhalations as they struggle towards the earth:—

The dim and horned moon hung low, and poured  
A sea of lustre on the horizon's verge  
That overflowed its mountains—yellow mist  
Filled the unbounded atmosphere, and drank  
Wan moonlight e'en to fulness—not a star  
Shone, not a sound was heard! the very winds—  
Danger's grim playmates on that precipice—  
Slept clasped in his embrace.

No one, perhaps, has attempted with more boldness than Shelley to paint the grandeur of a stormy night, when winds and clouds, and mingled brilliance and gloom, alternate or combine to impress a startling character upon the appearances of nature. The sky at night often seems to be a separate creation. Mountains, towering and dark, nod over immeasurable caverns; waterfalls stream over half the sky; rivers wind and glitter amid pearly banks; while huge animals, of shape more fantastic than the stuff of which our dreams are made, travel calmly over gulfs and abysses, with heads erect and forms enveloped in radiance. From the contemplation of phenomena such as these, Shelley had probably come warm when he threw upon paper the following strange picture:—

Where the irresistible storm had cloven  
That fearful darkness, the blue sky was seen  
Fretted with many a fair cloud interwoven  
Most delicately, and the ocean green,

Beneath that opening spot of blue serene,  
Quivered like burning emerald: calm was spread  
On all below; but far on high, between  
Earth and the upper air, the vast clouds fled,  
Countless and swift as leaves on autumn's tempest shed.

For ever, as the war became more fierce  
Between the whirlwinds and the rack on high,  
That spot grew more serene: blue light did pierce  
The woof of those white clouds which seemed to lie  
Far deep and motionless; while through the sky  
The pallid semicircle of the moon  
Past on in slow and moving majesty;  
The upper horn arrayed in mists, which soon  
But slowly fled like dew beneath the beams of noon.  
I could not choose but gaze; a fascination  
Dwelt in that moon and sky and clouds, which drew  
My fancy thither, and in expectation  
Of what I knew not, I remained: the hue  
Of the white moon, amid that heaven so blue,  
Suddenly stained with shadow, did appear;  
A speck, a cloud, a shape approaching grew,  
Like a great ship in the sun's sinking sphere  
Beheld afar at sea, and swift it came anear.

Keats, with all his richness of fancy, has accomplished comparatively little to illustrate the beauties of the night. He evidently felt its witchery, and occasionally, in his curious and quaint way, commemorates his admiration. But the world upon which he gazed was not the real one. He lived in fairy palaces scooped out in the depths of the earth, or arched over by the imaginations among the green waves of ocean. The moon and stars, and clouds and vapours, such as we usually behold them, were therefore things much too substantial for him. Here, however, is a picture from *Endymion*, which possesses inimitable softness and splendour:—

Methought I lay

Watching the zenith where the Milky-Way  
Among the stars in virgin splendour pours;  
And travelling my eye, until the doors  
Of heaven appeared to open for my flight,  
I became loath and fearful to alight  
From such high soaring by a downward glance;  
So kept me steadfast in that airy trance,  
Spreading imaginary pinions wide—  
When presently the stars began to glide  
And faint away before my eager view;  
At which I sighed that I could not pursue,  
And dropped my vision to the horizon's verge:  
And lo! from opening clouds I saw emerge  
The loveliest moon that ever silvered o'er  
A shell for Neptune's goblet: she did soar  
So passionately bright, my dazzled soul,  
Commingle with her argent spheres, did roll  
Through clear and cloudy, even when she went  
At last into a dark and vapoury tent—  
Whereat methought the lidless-eyed train  
Of planets all were in the blue again.

In roaming through the world of verse, we often find sweet patches, as it were, of description interspersed with thoughts and ideas which in themselves are not far removed from commonplace. In such cases, the best course is to tolerate the old for the sake of the new. Nearly all poets select the same topics around which to weave their fancies. The difference is in the treatment, and the more or less lavish splendour with which they are able to scatter about their imagery. Keats was peculiarly felicitous in this process of pouring vitality into ancient themes. His presence appears, as it moves along, to throw fresh colours on everything it approaches. His woods have a deeper gloom; his winds, a greater softness; his stars, a more jewelled sort of brightness than those of other poets; and this often in spite of very bad rhymes and very awkward phrases: But what is grotesque, we pardon in consideration of

what is tasteful and exquisite. Observe how, in discoursing of Hope, he interweaves delicious prospects of earth and sky:—

Whene'er I wander, at the fall of night,  
Where woven boughs shut out the moon's bright ray,  
Should sad despondency my musings fright,  
And frown to drive fair cheerfulness away;  
Peep with the moonbeams through the leafy roof,  
And keep that fiend, Despondence, far aloof.

And as, in sparkling majesty, a star  
Gilds the bright summit of some gloomy cloud,  
Brightening the half-veiled face of heaven afar;  
So when dark thoughts my boding spirit shroud,  
Sweet Hope! celestial influence round me shed,  
Waving thy silver pinions o'er my head.

The several forms which poetry assumes in the minds of different men, are extremely difficult to be characterised or discriminated. When Milton was as young as Keats, he wrote in a style equally imaginative and equally fanciful: both his imagination and his fancy were kept within certain bounds by a severer taste acquired by the study of the Greek. Throughout his life, he seems to have experienced no little trouble in reining in his ideas. Yet so refined was his sense of propriety, that he generally rejected every image, every simile, and every metaphor, not reconcilable with the stern decisions of his poetical philosophy. For this reason, his works often appear too artistic. The exuberances of nature have obviously been pruned away, but what remains when you carefully study it, seems only the more majestic and beautiful for the operation. He is called upon many times to speak of night. But his is not the night of a fluttered and bewildered fancy, but a picture of the vast universe divested of the illusions of the sun. A calm glory breathes over the face of nature; and solemn music, as if descending from the highest heaven, sweeps through the soul as we gaze and listen. Never did language move with a loftier port or grandeur than in the poems of this blind old man, who had familiarised himself with the inmost secrets of versification, until the words in which he clothed his ideas became, to borrow his own expression—

A linked sweetness long drawn out,  
With wanton maze and giddy cunning.

Untwisting all the chains that tie  
The hidden soul of harmony.

But when we enter the mighty creation of the *Paradise Lost*, and seek to detach passages that may represent the beauty and magnificence of the whole, we find it as impossible as to present a suit of chain-armour by taking out and exhibiting a single link. The merit lies in the unity, in the symmetry, in the proportion. Yet we must entreat the Muse of Paradise for leave to transfer a few passages from the immortal volume to our own pages; and first, let us take a glimpse of fairies sporting by moonlight:—

Fairy elves,

Whose midnight revels, by a forest side  
Or fountain, some belated peasant sees,  
Or dreams he sees, while overhead the moon  
Sits arbitress, and nearer to the earth  
Wheels her pale course: they on their mirth and dance  
Intent, with jocund music charm his ear;  
At once with joy and fear his heart rebounds.

Contrast with this another picture of night, strongly similar, yet how different:—

Now came still evening on, and twilight gray  
Had in her sober livery all things clad:  
Silence accompanied; for beast and bird,  
They to their grassy couch, these to their nests,  
Were slunk; all but the wakeful nightingale—  
She all night long her amorous descant sung.

Silence was pleased. Now glowed the firmament  
 With living sapphires; Hesperus that led  
 The starry host, rode brightest, till the moon,  
 Rising in clouded majesty, at length  
 Apparent queen, unveiled her peerless light,  
 And o'er the dark her silver mantle threw.

It has often been observed, that the great poets of antiquity devote very little of their works to description. With one short glowing word or phrase, they bring out the very soul of a landscape; and having fixed it in your memory for ever, pass on. This is peculiarly the case with Pindar and Sophocles, who invest with luminous ether a few favourite spots in ancient Greece. Homer is sometimes more diffuse; and on one occasion pauses, in a playful mood, to describe a moonlight scene, which latter altogether it would be difficult to rival:—

As when the moon, refulgent lamp of night,  
 O'er heaven's clear azure spreads her sacred light,  
 When not a breath disturbs the deep serene,  
 And not a cloud o'ercasts the solemn scene—  
 Around her throne the vivid planets roll,  
 And stars unnumbered gild the glowing pole;  
 O'er the dark trees a yellow verdure shed,  
 And tip with silver every mountain's head;  
 Then shine the vales, the rocks in prospect rise;  
 A flood of glory bursts from all the skies;  
 The conscious swains, rejoicing in the sight,  
 Eye the blue vault, and bless the useful light;  
 So many flames before proud Ilion blaze,  
 And lightning glimmering Xanthus with their rays.  
 The long reflections of the distant fires  
 Gleam on the walls, and tremble on the spires;  
 A thousand piles the dusky horrors gild,  
 And shoot a shady lustre o'er the field.  
 Full fifty guards each flaming pile attend,  
 Whose umbered arms by fits thick flashes send;  
 Loud neigh the coursers o'er their heaps of corn,  
 And ardent warriors wait the rising morn.

From this, let us make a transition to Barry Cornwall, who, among many other sweet things, has a delicious little song called *The Nights*. As we honour every one who loves the night, which is the period of inspiration for mortals, we shall reproduce this charming poem entire, that our readers may go, if they have not gone already, to the works of this poet, which are full of the spirit of gentleness and love:—

Oh, the summer night  
 Has a smile of light,  
 And she sits on a sapphire throne;  
 Whilst the sweet winds load her  
 With garlands of odour,  
 From the bud to the rose o'erblown!  
 But the autumn night  
 Has a piercing sight,  
 And a step both strong and free;  
 And a voice for wonder,  
 Like the wrath of the thunder,  
 When he shouts to the stormy sea.  
 And the winter night  
 Is all cold and white,  
 And she singeth a song of pain,  
 Till the wild-bee hummeth,  
 And warm spring cometh,  
 When she dies in a dream of rain!  
 O the night, the night!  
 'Tis a lovely sight,  
 Whatever the clime or time,  
 For sorrow then soareth,  
 And the lover outpoureth  
 His soul in a star-bright rhyme.  
 It bringeth sleep  
 To the forests deep,  
 The forest-bird to its nest;  
 To care, bright hours,  
 And dreams of flowers,  
 And that balm to the weary—rest!

Here, however, we must stop, for Aurora is beginning to purple the east, and admonishes us that we have wandered long enough among the shades of night. When we next take up the poets, it will be to converse with them on a very different subject. Yet we linger on the moonlight hills, and are strangely loath to emerge from this dusky fascination.

## THE MONTH:

### SCIENCE AND ARTS.

A VOICE in favour of education is making itself heard from an unusual quarter—the Royal Institution, where seven lectures are to be given on different branches of the all-important subject. The Master of Trinity leads off with a discourse on the moral and mental, to be followed by Faraday, Latham, Daubeny, Tyndall, Paget, and Hodgson, who will each advocate a special branch, all more or less taking the scientific view. Thus, the history of science, language, chemistry, physics, physiology, and economic science will in turn be brought forward, and their value as means of intellectual education be demonstrated. If as much good should result from these lectures as from those given to earnest throngs of working-men at the School of Mines, education will have received a beneficial impulse; one that is much needed, if we may judge from a speech delivered to the 'hands' on strike at Stockport by one of their orators. This teacher of the multitude told them that distress at home is caused by our foreign trade; that the further we send our manufactures, the more is their value reduced, and the greater the injustice to those who produce them. If the 'hands' would but find out that they have heads, such stuff as this would never be listened to.

There is something touching in the petition presented to parliament by 3000 miners of Durham and Northumberland, praying the legislative authority to step in between them and the risks to which they are exposed, and to which they fall victims, at the rate of 1000 a year. What they ask is reasonable enough—that provision shall be made 'for obliging all owners of collieries to provide such quantities of good air in accordance with the number of workmen employed, the character of the mine, and so forth, as will insure a healthy state of the workings for each man, and prevent accumulations of fire-damp in any part of such pits or collieries.' Seeing that mines can be properly ventilated, that the miners ask no more than science or skill can accomplish, we hope some decided means will be taken to remove the dangers and evils which attend their employment. Men are too valuable now—a days for us to go on flinging 1000 a year to destruction.

Hostile politics have not put a stop to emigration: ships are still sailing every week for Australia and North America with their hundreds of passengers. The *Times* correspondent in the East suggests, that instead of betaking themselves to the scorching and sandy shores of the former country, or exposing themselves to the bitter winters of the latter, they should emigrate to Turkey, where, at a comparatively short distance from home, are to be found some of the best natural advantages in the world. The shores are washed by the great central sea, there are rivers, bays, and noble harbours, fertile soil, and productions equal to any. With English industry and perseverance, what would not such a country become? the great trade to the East would again flow in its old channel, and order and security would reign where they have long been strangers. But ere this can take place, the elements of discord must be reduced to reason.

Judging from the fact, that plans for 140 railway bills have been brought before parliament this session, railway enterprise is not yet dispirited. There is talk, moreover, of a line direct to the north for the exclusive

transport of coal and bulky goods, with which the existing lines are too much encumbered, to the prejudice of the passenger-traffic. With all this, there is a constant endeavour towards greater safety in locomotion: the hollow axles for railway-carriages, introduced some time ago, are found, on further trial, to be preferable to those made solid. In weight alone, there is a saving of  $1\frac{1}{2}$  hundredweight on each pair of axles—no unimportant item in a thousand carriages. A block, weighing nearly a ton, being let to fall from a height of twelve feet on both kinds of axles, by way of experiment, the solid were invariably seen to give way first. They break across; while the hollow ones, when they fall, open lengthwise only, and thus there is little risk of detachment of the wheels. There is a new method, too, for clearing boiler-tubes of the ashes, cinders, and incrustations which, as is well known, collect within them. The usual process is to push a long ramrod through, which drives everything before it—a task of nearly an hour; but by means of a flexible pipe, fitted with a nozzle, and leading from the steam-chamber, a blast of steam may be blown through every tube, and all the accumulations cleared away in ten minutes. We hear that an attempt has been made on one of the lines between New York and Philadelphia to obviate the noise and uneasy jolting, by laying down sleepers of india-rubber, whereby an easy, elastic motion is given to a passing train. We think it likely that this is an experiment requiring multiplied experience in different temperatures before it can be pronounced successful. The Egyptian railway is so far advanced, that fifty miles of it were used for the transport of one of the last overland mails. The tunnel through the Alps is now to be outdone by one through the Andes—that is, if the projectors who wish to make a railway from Brazil to Chili can accomplish their purpose. We may not inappropriately round off these railway items by mentioning the noble statue of George Stephenson, placed a week or two since in the hall of the Euston Square terminus. It is a fitting site for the marble image of the self-reliant Northumbrian miner, who came from the depths of the earth to teach men how to travel on its surface. He is one of those heroes of whom England has reason to be proud; and while locomotives roll along their iron path, he will not be forgotten.

M. Costa reports to the Académie, that the breeding of salmon by artificial means has gone on successfully: new species from other countries have been introduced into the establishments on the Loire, at Saumur, and in the department of the Ière; and into those in the Vosges a large kind of trout from Switzerland. It is thought that something similar might be attempted on the sea-shore; and at Rochelle a project has been mooted for the 'cultivation' of oysters and prawns. Mr Boccia says that he, and not the two French fishermen, was the originator of pisciculture; and he intends to shew that the process is more simple than has been supposed, the grand elements of success being pure air and pure water. The late earthquake in Calabria has again set geologists speculating: M. Perrey finds reason to believe that the shocks, in some degree, depend on the moon, as they most frequently occur when our satellite passes the meridian.

Father Secchi, of the Observatory at Rome, traces a marked connection between perturbations of the magnet and appearances of aurora; and these perturbations, he believes, frequently indicate the presence of an aurora in a high northern latitude, although invisible to us; and, what is more, he suggests that they are sometimes caused by the passage of aërolites through our atmosphere. According to Boussingault, the rain which falls in towns contains much more ammonia than in remote rural districts, and in greater quantity at the beginning than the end of a shower. He finds, also, that ammonia is always present in dew; and in so

unusual a proportion in some of the November mists, as to exert a noxious influence.

From certain statistical returns which have been laid before the Académie, we gather a few interesting particulars concerning professors of the medical art on the other side of the Channel. It appears that there are in France 11,217 physicians, 7221 officers of health, 5175 druggists; yet, large as this number is, there are 591 communes, each of more than 2000 inhabitants, in which not an individual of the three classes here mentioned is resident. Another return on the subject of births shews, that where 123 children are born between 9 P.M. and 9 A.M., 100 only are born within the other twelve hours. Here is a fact useful to those who know how to employ it: there is a gas talked of, which, directed in a stream against an irritable abscess, is said to allay the torment forthwith—another addition to the value of life.

Now that the science of life is better understood than formerly, facts have come to have a significance too long lost sight of, particularly as relates to the maintenance of a military system. Of the 180,000 young men drafted every year for the army in France, one-third of the strongest and stoutest are made into soldiers; the others, among whom are the stunted, the weakly, and deformed, are sent back to their homes, where they marry and beget children, who inherit their imperfections. In this way the *physique* of the nation is gradually deteriorating, and at a rate that appears rapid when a quarter of a century is brought under review. The drawing away of young men from their ordinary pursuits for military service, is thus an evil of grave import in more senses than one; but, judging from the present aspect of affairs, the true remedy is not likely to be adopted for some time to come. In Prussia, too, similar effects have been noticed: out of the youths of nineteen who were inspected last year throughout that kingdom, not more than half the numbers assembled were sound and stout enough for service, the rural districts being as bad as the large towns. It would seem that, with improving education, the stamina of the people weaken or decay. In Sweden, also, the same result has been observed; but there it is attributed to potato-diet and a habit of much spirit-drinking. Have governments yet to discover a means for preserving the bone and muscle of peoples, or must the people find it for themselves? In respect of education: of the men examined in Berlin, 95 per cent. were found to be fully educated, and 5 per cent. defective. In the provinces, 75 per cent. only had gone through their school course; 20 per cent. were defective, and the remainder altogether uninstructed. The Polish and Wendish provinces were the most backward.

The uneasiness felt a short time since at the growing scarcity of rags is subsiding, for it is now found that good paper can be made from the refuse of the sugar-cane, and from wood-fibre, the latter being L.12 a ton cheaper than that made from rags. The plantain, too, has been tried, and successfully, as was demonstrated by some specimens of plantain-paper exhibited at a meeting of the Horticultural Society. Printers and publishers, and those who deal in penny-periodicals, may therefore take heart: their profit will not be all swallowed up by the cost of the paper, as there was reason to fear.

From a communication made to the Geological Society, we find that the fossils of our Devonian system are more widely spread than would at one time have been thought credible, numerous specimens having been found by the explorers in the polar regions; while in the British Museum may now be seen a collection sent from Kwangsi, in the south of China.

Mr Beecroft, for many years British consul on the western coast of Africa, has at length, after repeated attempts, found the junction of the Benue and Niger rivers. It is a feat worth recording, for his last effort

took six weeks of laborious search among mangrove swamps and slimy creeks. If by this discovery the interior be rendered more accessible, our traders will soon doubtless follow Dr Barth to Timbuctoo.

Chevalier Vande Velde, of Utrecht, known for his travels in the Holy Land and surrounding countries, has addressed a letter to the Archæological Association of Palestine, in which he recommends them not to believe M. de Saulcy's statements about the Cities of the Plain; for that the so-called cities are nothing other than broken masses of a mountain, which the Arabs succeeded in making the too credulous Frenchman believe to be the ruins of Sodom and Gomorrah. Colonel Rawlinson sends from Bagdad news of the discovery of more cylinders, at a spot identified as the ancient Ur of the Chaldees, which are of importance in clearing up a difficulty in the annals of Belshazzar. He now considers that monarch to have been a viceroy under his father Nabonidus; and thus these new-found records, as he states, 'furnish us with a key to the explanation of that great historical problem which has hitherto defied solution.' Besides this, the colonel has got a statue of the god Nebo, which was dug up by the party of explorers employed for the British Museum. An inscription on its breast contains the names of Belochus and Sammuramit, or Semiramis. So the great queen comes out of the mists of fable at last; and, disregarding all that has been said about her and Ninus, our persevering countryman makes her out to have been the daughter of a king of Medo-Armenia, who married Phal-lukha, or Belochus, and reigned jointly with him over Assyria in the eighth century before Christ.

#### CUTTING-OUT.

THERE is a certain delicate and desperate species of naval service in which British seamen are peculiarly distinguished as able, and frequently successful, professional operators: it is called *cutting-out*. This very rarely takes place on any extended scale, and it is equally rare for any large force of men to be employed upon it. As a general rule, cutting-out is performed without much premeditation or nice calculation of risks: it is usually planned by some young spirited officer in command of a frigate or small flotilla, and undertaken almost impromptu by himself and other daring naval aspirants, as much from a feverish resolve to distinguish themselves, and earn promotion by 'doing something,' as from any other motive. It is rarely we find veteran officers of high rank engaging in such desperate adventures, unless there is a very important stake to be gained—some object either of extraordinary intrinsic value, or else likely to lead to commensurate advantages. It is a service *sui generis*, requiring particular faculties, distinct and different from those essential in other branches of the service. Young, dashing fellows, of dauntless bravery—

That for itself can woo the approaching fight,  
And turn what some deem danger to delight—

who can coolly and skilfully lay down their plans, and daringly execute them in person, are the men to succeed on the occasions in question.

Suppose a frigate chases an enemy, of equal, or superior, or inferior force—no matter which—and that enemy, by dint of shewing a nimble pair of heels, runs into a friendly harbour before he can be overtaken. Here the Don, or Mynheer, or Mounseer, or Moslem, or whatever he may be, shelters himself by mooring stem and stern under the guns of a battery on shore, and grins defiance at his disappointed pursuer. What is to be done? The British frigate sails as closely in as may be prudent or possible, and hovers about till sunset, meanwhile diligently taking note by aid of her glasses—as telescopes are called on shipboard—of the

position of the coveted prize, and the nature of the shore defences, and all other obstacles to her capture; then, ere nightfall, tacks about, shews her stern, and steers directly out to sea, as though sullenly confessing she has no chance. Has the captain given up all hope of doing business?—Not a bit of it. He dives down into his cabin, and, either alone or in consultation with his lieutenants, rapidly plans a cutting-out. The crew are duly mustered, and their commander's intention being promulgated, they give a cheer like true British sailors, and eagerly volunteer for the boat-service. The required number are promptly selected, armed with cutlasses, pistols, and boarding-pikes, and a strip of white ribbon tied round their left arms, to distinguish them in the coming tussle. It is clearly settled what boats are to be despatched, what officers are to command, what seamen and marines are to go in each boat, and in what order the boats are to lead and board, &c. As soon as it is dark enough, the frigate points her head for the shore again, and probably about midnight, after extinguishing or shading every light, brings-to in a position deemed most favourable for her to await the result of the enterprise. Pinnace, cutter, jolly, and gig, are silently lowered; the men take their appointed places; and without a word being spoken, the carefully muffled oars are dropped into the water, and the boats glide noiselessly towards their destination. Of the rowers, it may be truly said that, in the regular man-o'-war fashion,

Bending back, away they pull

With measured strokes most beautiful!

But on these momentous occasions they poise their oars so deftly, feather them so gently and accurately, and dip the edge of their blades with such keenness and precision, that there is no splash in the water, and no rumble from the row-locks; and should the sea be smooth, a musical ripple at the stem, and an undertoned gurgling sound in the runs of the stern, alone betoken the propulsion of the boat. Possibly, they may get close alongside, or even board the enemy's ship ere they are discovered; but in general a better watch is kept, and they will find the sentinels on the alert, and be fired at the moment they come in sight. No matter. As soon as silence and precaution are no longer of use, every boat cheers loudly, and dashes recklessly forward in eager emulation as to which shall be the first to board. Soon they are alongside, the men climbing up the chains, and clambering over the boarding-nettings, despite the fierce thrust of pike and cutlass, or the deadlier resistance of musket and bayonet. All is now desperate hand-to-hand fighting; and whilst it rages, a party of our frigate's men run aloft to loose the topsails, and others cut the cables, so as to get the enemy under-way, and out of the range of the shore-battery as speedily as possible. When resistance is overcome, the crew of the captured vessel are driven headlong below, and secured beneath the hatches, and the gallant cutters-out sheet home the sails, or, if the wind is dead, tow the ship out of harbour with their boats. Ere this time, probably, the battery on shore opens a furious fire, which may kill friend and foe indiscriminately; but British tars are not easily deterred from carrying out a cherished design; and unless the masts and rigging are materially shattered, the vessel is quickly beyond range of the hostile cannon, and, when morning breaks, the triumphant frigate and her prize are mere specks in the offing. Occasionally, however, the result is sadly different. The enemy may be so well prepared, that some of the boats may be sunk ere they can pull alongside, and the men who manage to board may be all slain or taken prisoners.

We have recently searched our naval chronicles, and have conned over a great number of cutting-out affairs, and we now purpose to give some account of two or

three, which appear to us to be the most remarkable and brilliant on record, and cannot fail to impress the reader with a vivid conception of the truly marvellous deeds of naval skill and daring that British men-of-war's men will undertake and perform. One case is an honourable failure; but we will give it the first place, both for the sake of chronology, and because it was planned and attempted to be carried to a successful issue by the justly celebrated Sir Sydney Smith, and led to other incidents of historical note.

In the spring of 1796, Sir Sydney was cruising on the French coast in command of the *Diamond*, 38-gun frigate, when he learned that the *Vengeur*, an armed French lugger—only too well known in the Channel for her numerous captures of English merchantmen, and which had hitherto defied capture herself through her wonderful sailing qualities—was anchored, ready for sailing, in the inner road of Havre. Sir Sydney resolved to cut her out; and accordingly prepared the launch and four other boats of his frigate, in which he embarked fifty-two officers and men, all told, and took the command of the whole himself, because his three lieutenants were, from one cause or other, unavailable for the duty. At 10 p.m. they set off, and after a brief struggle, seized the *Vengeur* without the loss of a man. But the difficulty was, not to win this prize, but to carry her out to the offing. The French crew had cut their cables, and the lugger drifted bodily shoreward, spite every effort of the capturers. By daybreak, the lugger was anchored up the river beyond Havre, and a number of vessels put forth from that town to re-capture the prize, which Sir Sydney, on his part, was resolved to defend to the utmost. He first sent the prisoners ashore, and then prepared for action. In a brief period, a large lugger opened fire on the *Vengeur*, and numbers of small vessels, full of soldiers, surrounded her, and poured in volleys of musketry. There being no wind to fill his sails, the gallant British captain found he had become thoroughly entrapped, and at length surrendered, with a loss of about a dozen killed and wounded. Sir Sydney Smith was removed to Paris, where he suffered a rigorous imprisonment of two years, and was even threatened with death on the pretence that he was a spy. Finally, he effected his escape from the Temple in a characteristically romantic and daring fashion, the details of which are probably well known to the reader.

In the year 1797, a fearful mutiny took place on board the *Hermione*, 38-gun frigate, commanded by Captain Pigot, when cruising off Porto Rico in the West Indies. The excessively cruel and monstrously tyrannical conduct of the captain, appears to have been the sole cause of this affair; but the mutineers were not content with sacrificing that wretched man, for they murdered nine other officers, and then carried the frigate to La Guayra, and traitorously gave her up to the Spaniards; and as a Spanish frigate she subsequently sailed the seas. Many of the mutineers paid the deserved penalty of their crimes. In 1799, this same *Hermione* was reported to be bound from Puerto-Capello to Havanna, having a crew of nearly 400 men, including a number of soldiers, and mounting forty-four guns, or six more than when she was a British frigate. The British admiral at Jamaica ordered the *Surprise*, Captain Hamilton, to go out and try to meet with the *Hermione*. The *Surprise* was a 28-gun frigate, with a complement of less than 200 men, and therefore in all respects very inferior to the vessel she was sent to engage; but sailors in those busy fighting-times did not care to calculate odds very nicely: they were all ready to swear that one Englishman was, any day and in any way, a match, and more than a match, for two Mounseers, or three Dons. However, no such encounter and triumph was destined for the British frigate this time, for after Captain Hamilton had cruised about for weeks without getting a glimpse

of his antagonist, he thought it best to sail to Puerto-Capello, and learn whether the latter had really left that port. Surely enough she had not, for between two enormous batteries at the harbour mouth, the *Hermione* was snugly moored stem and stern. For some days the *Surprise* hovered about, and finally Captain Hamilton informed his assembled crew that he had determined to cut out the *Hermione*—an intimation which they received with three hearty cheers. Six boats were prepared, carrying in all 106 officers and men; and explicit orders were given to every officer individually. Mr James gives a very minute and accurate account in his *Naval History* of this dashing enterprise; and we cannot do better than follow his version, and partially quote his narrative. Captain Hamilton in person commanded the pinnace, and directed the whole operations. The flotilla of boats were discovered when within a mile of the *Hermione*, and two of the enemy's gun-boats opened fire on them. Some of the frigate's boats foolishly engaged with these gun-boats, instead of following their captain straight to the main attack. 'The alarm created by the firing,' says Mr James, 'soon awakened the crew of the *Hermione* to the meditated attack. Lights were seen at every port; and the ship's company were at quarters. On the pinnace crossing the frigate's bows in order to reach her station, a shot was fired from the fore-castle, which crossed over her. . . . As the starboard oars touched the bends of the *Hermione*, Captain Hamilton gave orders to lay in the oars and board, the boat being then under the starboard cat-head and fore-chains, lying stem and stern with the frigate. The crew obeyed the word instantly; and the captain would have been the first on board, but from some mud on the anchor—which was hanging from the cat and shank-painter, and which had been weighed that day—his foot slipped; but he retained his hold on the foremost lanyard of the fore-shrouds, by which he recovered himself, his pistol going off in the struggle. Having succeeded in gaining a footing on the fore-castle, the English freed the foresail ready for bending and hauling out to the yardarms, laying over the forestay; and this served for an excellent screen to these few daring men now on board.' By this time, the Spanish crew, at quarters on the main-deck, were firing away, not yet being aware they were actually boarded; but the Spaniards on the quarter-deck warmly disputed their post, and a fierce hand-to-hand encounter ensued, Captain Hamilton himself being wounded severely. At a critical moment, the marines from one of the cutters boarded, and gave a turn to the fight. They fired a volley down the after-hatchway, and then rushed below with fixed bayonets, driving sixty Spaniards into the cabin, and there securing them. The cables now were cut, and with the aid of the foretop-sail and the boats, the *Hermione* was got under-way, and stood out of Puerto-Capello, despite the fire of the formidable batteries, which, however, cut up the rigging, and lodged some balls below the water-line. The boarding commenced at midnight, and by one o'clock all resistance ceased, and in another hour the prize was safely out of gunshot, and in full possession of the daring captors.

Only twelve British seamen were wounded, and none killed; but the Spaniards suffered the amazing loss of 119 killed, and 97 wounded—in all, 216, or above one-half of their entire crew! Even Mr James, who is usually so cool and guarded in expressing his opinions, and who is admitted to have written his great work with the nicest impartiality, cannot help warming when narrating the affair; and he justly and strikingly sums it up by saying, that 'the history of naval warfare, from the earliest time to this date, affords no parallel to this dashing affair: it was no surprise, no creeping on the sleepy unawares; the crew of the frigate were at quarters, standing to their guns, aware of the attack, armed, prepared, in readiness;

and that frigate was captured by the crews of three boats, the first success being gained by sixteen men. . . . The best record of this well-planned, well-executed, daring, gallant enterprise, is to be found in the Painted Hall at Greenwich Hospital.' For this exploit, Captain Hamilton was knighted; the House of Assembly at Jamaica voted him a sword worth 300 guineas; and the Common Council of London voted him the freedom of the city. As to the *Hermione*, she was restored to her rank in the British navy, under the significant name of the *Retribution*.

Our next and concluding narrative of cutting-out is more modern in date, and the distinguished hero of it is yet, we are happy to say, living, full of years and honour. Lord Cochrane (since 1831, the Earl of Dundonald) has ever been reckoned unsurpassed for the very remarkable valour and daring skill displayed by him during many of the earlier and happier years of his naval career, prior to 1814, when his professional prospects were destroyed by the lamentable stock-jobbing hoax, in which, there is now every reason to believe, he was a mere dupe of scheming villains, and far more to be pitied than condemned. Up to that period, there was not a more active, skilful, and successful officer in the whole navy; in proof of which it is worth mentioning, that during the ten months he commanded the *Speedy* sloop of fourteen guns, he captured the vast number of thirty-three vessels, mounting in all 128 guns. This by the way. In 1818, he became commander-in-chief of the navy of Chili in South America, and soon afterwards occurred the brilliant affair which is the means of introducing him to the reader of this article. The Chilians, we must premise, were fighting for their independence against the Spaniards. Lord Cochrane anchored with some ships in the outer roadstead of Callao, and at the same time there lay in the inner harbour a large forty-gun Spanish frigate named the *Esmeralda*, and two sloops of war, with fourteen gun-boats, and other defences disposed around them, besides the protection of a formidable range of batteries ashore. The frigate was well prepared for defence; nevertheless Lord Cochrane determined to cut her out. For this purpose, he collected about 240 volunteers from his vessels, and placed them in fourteen boats, which, in two divisions, proceeded to carry out the desperate enterprise, commanded by his lordship in person, on 5th November 1820. The result may be given in the words of Captain Basil Hall:—'At midnight, the boats having forced their way across the boom, Lord Cochrane, who was leading, rowed alongside the first gun-boat, and taking the officer by surprise, proposed to him, with a pistol at his head, the alternative of "Silence or death!" No reply was made; the boats pushed on unobserved, and Lord Cochrane, mounting the *Esmeralda's* side, was the first to give the alarm. The sentinel on the gangway levelled his piece and fired, but was instantly cut down by the cockswain; and his lordship, though wounded in the thigh, at the same moment stepped on the deck. The frigate being boarded with no less gallantry on the opposite side by Captain Guise, who met Lord Cochrane mid-way on the quarter-deck, and also by Captain Crosby, the after-part of the ship was soon carried, sword in hand. The Spaniards rallied on the fore-castle, where they made a desperate resistance, till overpowered by a fresh party of seamen and marines, headed by Lord Cochrane. A gallant stand was again made on the main-deck; but before one o'clock the ship was captured, her cables cut, and she was steered triumphantly out of the harbour, under the fire of the whole north force of the castle. The *Hyperion*, an English, and the *Macedonian*, an American frigate, which were at anchor close to the scene of action, got under-way when the action commenced; and in order to prevent their being mistaken by the batteries for the *Esmeralda*, shewed distinguished signals; but

Lord Cochrane, who had foreseen and provided even for this minute circumstance, hoisted the same lights as the American and English frigates, and thus rendered it impossible for the batteries to discriminate between the three ships. The *Esmeralda*, in consequence, was very little injured by the shot from the batteries. The Spaniards had upwards of 120 men killed and wounded; the Chilians, eleven killed and thirty wounded.'

#### LIQUID INDIA-RUBBER.

A correspondent of a New York paper, writing from Para, in Brazil, says: 'There is a method in preparing the gum, which has recently been patented, and which differs essentially from the usual curdling. The milk, as drawn from the tree, is put into large glass bottles and demi-johns; a preparation of some chemical nature, which is a secret, is mixed with the milk, and the bottles are securely sealed. In this way the gum is sent to the United States. It curdles twenty-four hours after exposure to the air, and forms a pure, white, solid, and remarkably strong rubber. There is only one house in Para which has the secret of this receipt, as I learn, and a member of the firm gives his personal attention to the preparation of the article, some thousands of miles in the interior of the country.'

#### 'KNOWLEDGE IS POWER.'

20th April 1854.—SIR.—Since the popular acceptance of the motto, 'knowledge is power,' is not deducible from anything Bacon ever uttered, would it not be well to explain how the remark became attributed to him? When I saw you notice it in your very intelligent *Journal* (February 2), I hoped others would have asked you to do this, and spared me the trouble of copying and translating the following extract. Speaking of the sources of heresy and religious error, Bacon has this passage (*Meditationes Sacre de Hæresibus*, p. 747): 'Tertius gradus est eorum qui arctant et restringunt opinionem priorem tantum ad actiones humanas quas participant ex peccato, quas volunt substantive, atque nexa aliquo causarum, ex internâ voluntate et arbitrio humano pendere, statuuntque latiores terminos scientie Dei quam potestatis: vel potius ejus partis potestatis Dei (nam et ipsa scientia potestas est), quâ scit, quam ejus quâ movet et agit; ut præsciat quedam otiose, quas non predestinet et præordinet. Sed quicquid a Deo non pendet, ut auctore et principio, per nexum et gradus subordinatos, id loco Dei erit, et novum principium, et deaster quidam.' 'The third kind is that of those who restrain and confine the former opinion simply to the actions of men which partake of sin, which they will have to depend, directly and without any intervention of causes, upon the internal disposition and will of man, and who consider the limits of God's knowledge as more extensive than those of his power; or rather of that part of God's power—for even knowledge itself is power—with which he takes cognizance, than of that with which he moves and acts; as though God foreknew some things inactively, which he does not predestinate and foreordain. But whatever does not depend upon God, as its author and source, by subordinate links and steps, that will be in God's place, even a new principle and a certain little divinity.' Bacon, then, does say, knowledge is power; but he is speaking of God's knowledge, which he considers not less circumscribed than, and the same with, God's power. Sir E. Bulwer Lytton must have overlooked this passage, or he would hardly have said the aphorism was that of the Index-maker, or have made the remarks he does in the note to Book iv., Chap. xix., of *My Novel*, as well as in Dr Riccabocca's conversation in that chapter.—I am, &c. GEO. H. BRILLINGTON, M.A.

Westbury, Salop.  
[In Bohn's edition of Bacon's Works, 2 vols., 1846, the passage occurs in vol. ii., p. 750.—Ed.]

#### THE BEAM AND WHEEL EXPERIMENT.

With reference to this experiment, alluded to in 'The Month' (*Science and Arts*) for April, a correspondent suggests the following as a solution: 'If a beam is balanced, as stated, upon an upright standard, and any weight, whether wheel or not, is attached to one end, the beam will alter its position according to the weight attached; but mark, if it is a wheel that is attached, and that wheel is made to rotate rapidly, you instantly divide the weight of the wheel into two equal parts—one part going downward, and the other part going (by the velocity) upward; therefore, from this simple cause, while the wheel is in rapid motion the beam will not lose its gravity.'

## THE GLORIES OF SYDENHAM PALACE.

WE read of some personage in past days that he awoke one morning and found himself famous. Sydenham is somewhat in the same position. Only a few short months ago, it was a quiet suburban village, in which the birds sang, the flowers and trees put forth their blossoms and leaves, the hills were green, the sky was clear, the air was calm and serene. In the neat villas around, the banker's clerk from Lombard Street, the shopkeeper from Cheapside or Fleet Street, the stockbroker from Capel Court, the wharfinger from Tooley Street, might have been found snugly located: men who came up by rail in the morning to the busy haunts of commerce, and went back in the evening to the comforts of a good dinner, and the easy quiet of a domestic fireside. But what is Sydenham now? It is true that there are still birds to sing, flowers to bloom, trees, hills, sky, villas, good dinners, and domestic firesides; but there is something besides all this. Sydenham has become famous; a thing to be talked about. There is not a nation in the world, we may almost venture to say, but to which Sydenham will by and by be familiar by name. Kosma Milokroschetchnoi, who sent some flax from Pudoj, in Russia, to the Crystal Palace in Hyde Park; Sofialoglou's daughter, who sent embroidered shawls from Constantinople; Christina Johnsdotter, who sent a skein of home-spun thread from some unpronounceable village in Sweden; Heltachi, who provided chamois-horn carvings from the Swiss Oberwyl; Johann Mitterbergen, who sent shoe-tips from a Styrian village—all will know the name of Sydenham in due time, when the newspaper has done its work in its wonted way. Our own private opinion is, that Norwood has been robbed of a fair chance of fame; that there is a *casus belli*, inasmuch as the new Crystal Palace belongs locally rather to Norwood than to Sydenham. Sydenham is in Kent; but Norwood is in Surrey, and so is the Crystal Palace. The Londoners may likewise ask: Why is it not nearer us, on whom it must depend? Why not have pitched it about a penny steam-trip up our beloved river? But it is too late now to object; the die is cast, and Sydenham has a career of renown marked out for it.

This truly wonderful and altogether unprecedented enterprise has already occupied a few of our pages. In two former articles,\* the history and general character of the undertaking were traced, and the structure noticed so far as its most striking features are concerned. But the time has arrived for something more than this. Readers in every corner of the land ought

to know in what way has been carried out the audacious—the grandly audacious—plan of spending a million sterling for shilling visitors. At the present moment, when the talk is of royal visits and inaugural ceremonies, let us endeavour to give a faint idea of the beauty and majesty of this transparent palace—unfinished portions notwithstanding.

From a multitude of hilly districts in Surrey and the surrounding counties, this Sydenham structure can be seen. From the summit of the round tower at Windsor, and from a particular part of the East Terrace when the sun shines at a certain angle; from Hampstead, and Highgate, and Primrose Hill; from Dartford; from Knockholt; from the Dorking Hills—the building can be seen, either in its bold outline or by the glitter from its acres of glass. From some points we see it 'end-on,' as the sailors would say, and then it is only a glittering square mass; from others we see the broad façade straight fronting us, and then the grandeur of the three transepts becomes manifest; but it is the diagonal or angular view which best rewards the spectator; the endless variations in the relation which the curved lines bear to the straight, give to the whole of the ironwork the charms of the most infinitely varied tracery-work; while the sunlight and the blue light of the sky, partly transmitted through and partly reflected from the glass, almost convey the idea of the structure itself being one enormous crystal. There are two or three points on the Croydon Railway whence the palace can be seen grandly projecting itself against the blue sky behind; for it is one of the merits of the scheme, that the building crowns a ridge which gives increased elevation to it, nobly lofty as it is in itself. When the visitor enters by the new-curved portion of railway through the park and grounds, he will do well to notice how new beauties of form develop themselves, as he views the east façade at a gradually varying angle. And those who trudge up the hill from the Anerley Station (Sydenham Station does not reward the wayfarer; for there is a walk of a mile before the palace can be seen at all), having the south-east angle of the building nearest to them, are enabled to appreciate the magnitude as well as the elegance of the structure; for there are houses in the road, the Lilliputian appearance of which as the palace towers above them, is not a little remarkable. Let not any one be frightened by the ugly brick chimney near the south end; this is only a temporary necessity, until the two towers are rebuilt. Those, too, who approach from the west, and who see how the building seems to rise bodily above the trees of Dulwich Wood and Norwood, can appreciate breadth and height better than by the study of yards, and feet, and inches. If, however,

\* Second Series of C. E. J., No. 516, p. 321; No. 517, p. 342.

a calmly mathematical man should wish to test the magnitude of the building by means pleasurable to himself, there is ample opportunity; he will observe that the tiers or stories are about twenty feet high each, and the number of these superincumbent tiers will shew how lofty is the building; he will observe that there is a uniform eight-foot space from column to column, and the number of these spaces will indicate a total length of nearly a third of a mile; he will stand in front of the glorious central transept, and noticing that there are six tiers or stories before the springing of the semi-circular roof commences, he will appreciate the height to which an arch of 120 feet diameter will carry the façade.

But we may safely defy any visitor to think much of feet and inches when he enters the building. He has other subjects for thought. While on the level of the floor, he has within view the lofty circular-headed terminations of the north and south façades, and the circular-headed terminations of the transepts on the east and west sides. The vaulted glassy coverings of these three transepts, and of the whole length of the nave, furnish the curved lines for the tracery, while the hundreds of columns and the thousands of sash-bars furnish the straight lines; and thus a most exquisite picturesque geometry—so to speak—is produced. It is this combination of so many curves with straight lines which gives to the Sydenham Palace one of its points of superiority over the Hyde Park Palace. And when an ascent is made to the higher tiers, this combination becomes still more varied. There are eight or ten staircases of majestic proportions, leading up to the first or grand gallery, which goes entirely round the nave and all the transepts; and there are lightsome spiral staircases leading thence upwards to a height of which nothing in the former building can give us any conception. After mounting about forty stairs or steps, we reach the great gallery just spoken of; thirty-two more bring us to a level, whereon there are galleries only at the ends of the transepts; thirty-two more, and we attain a narrow gallery, making the circuit of the building; thirty-two more—at the central transept—and we reach another partial gallery; thirty-two more, and a gallery is reached which encompasses the main transept, boldly crossing the nave at a dizzy height from the ground—a height measured by about 170 stairs or steps. We do not mention these numbers and heights as a matter of statistics; we refer to them only for the purpose of saying, that at each new elevation, the extraordinary interior of the building presents itself under a new point of view, a new phase of beauty. Every one knows that a circular curve becomes elliptical when viewed obliquely, oblate or prolate, as the case may be; and thus, at different angles and different heights, we have light and delicate lines—horizontal, perpendicular, circular, oblate, prolate—combining to form a skeleton framework of surprising beauty; and as all parts of these lines are coloured in the rich harmonious tints suggested by Mr Owen Jones, the effect is such as no mere description can convey. From one point we appear to have a perfect forest of columns spreading out before us; from another, we look along an arched vista 1600 feet in length; from another, we look upward to a vaulted transept which is in itself a veritable triumph of mechanical construction; while from the highest gallery we look down upon the pleasure-seeking pigmies spread about the acres of flooring below. Nor does the outer world cease to charm, for as the building is all window, the eye ranges over a larger and larger area of country as we ascend higher. On the west, Dulwich and Norwood appear at our feet, green fields and pretty villages occupy the middle distance for miles and miles, while spires and blue hills mark the boundary of a very distant horizon. On the east, there is Sir Joseph Paxton's splendid mark spread out

—a treat for many a summer-day's holiday, even if there were no Crystal Palace at all; the terrace near the building; the parapets and balustrades; the statues and urns; the grand flights of steps; the noble gravel-walks; the delicately arranged Italian garden, with its basins and fountains; the English garden, with its paths and beds, its rich flowers and plants; the grounds beyond the two gardens, with their trees and shrubs; the circular basins and their hundred-jetted fountains; the lake and the islands; the gigantic fossil animals; the geological and mineralogical constructions—all will one day present an extraordinary spectacle, as seen from the 100,000 square feet of window on the eastern façade; and even in their present partially finished state—for much remains to be done both within and without the building—we may travel far indeed before meeting with a parallel.

The pigmies whom, in the pride of elevation, we look down upon from the upper-gallery, are veritable men and women seeking for beauty, and finding it. The beauty which we have been hitherto admiring, is that of the building and its external accompaniments; but the ground-floor of the nave has that to display which is little dreamed of except by the small number of persons who have watched the progress of the works during the last few months.

Let us endeavour to convey an idea of the arrangement of the nave, by comparing it with that of the former Crystal Palace. We all remember—for no one can and no one ought to forget the old building, the child which was 'father to the man'—that in the Hyde Park structure, the centre of the nave was occupied by various large-sized articles of art and manufacture, and that on either side of these were courts and avenues, filled with the products of various nations in different branches of industry. At Sydenham, the nave is—or will be—occupied by ranges of sculptures, for which every corner of Europe has been ransacked. Between, and around, and among these will be basins, and fountains, and flowers—a very galaxy of beauty. On either side of the nave is a range of courts, each a complete architectural work in itself, and finished with a degree of elaboration almost unparalleled in recent times. The courts are about eighteen in number, some on one side, and some on the other of the nave. All the courts in the northern half of the building are architectural and sculpturesque; all those in the southern half—with one exception—are for the reception of industrial products. If we were required to name an average size for all the courts, we might perhaps say forty or fifty feet square each; but this is a question of figures which few persons will care to think about when roaming through these 'dazzling halls.' The courts all present a façade or frontage to the nave, as if they were eighteen distinct buildings, of which these are the exteriors; and the great point of interest is, that each one of these is totally different from all the others: a veritable architectural study in itself. Nearly all of them are complete in their isolation, having four frontages elaborately finished within and without; but the doorways and corridors are so arranged that a visitor can pass readily from one to another—his path, it may be, bordered with the shrubs and flowers which Sir Joseph has been storing up for us. As to the order of the courts, in respect one to another, we suspect that changes of plan have thrown a little discord into the matter. Why the Saracenic Court should intervene between the Assyrian and the Roman, or why the Pompeian should be separated widely from all the others, does not by any means appear. If the Assyrian were placed close to the Egyptian, and the Pompeian close to the Roman, there would be these two points of symmetry—that the various styles of architecture would succeed each other in proper order, northward up the west of the nave, and then southward down the east: and that while the

western courts would be all pagan, or rather, non-Christian, the eastern would be all Christian. This latter effect has been obtained; and if the former has been somewhat disarranged, we must infer that there have been difficulties in the matter which could not be surmounted.

Each of these courts is a book—a book bound in gold and colours. We can read the history of the past in its form and construction, its sculptures, its decorations, its inscriptions and emblems, its mosaics and fountains. It tells us a little of the domestic arrangements of a particular age, and much of the religion. Let the courts tell their story to us.

**THE ASSYRIAN COURT.**—Here the name of Layard comes to one's thoughts in a moment. We remember how the labours of one man in the East have furnished the materials whence this gorgeous court has been constructed; and we cannot fail to acknowledge, that when the directors of the Crystal Palace sought the services of two gentlemen who have written and studied so much on the subject as Dr Layard and Mr Fergusson, they gave a liberal guarantee that the best which could be done would be done. And here we have the result. Recollecting that until Layard ferreted out Nineveh, it was nothing but a mound of earth-covered bricks, we may easily understand that supposition has had much to do with this Nineveh of the Crystal Palace. It is not a model of any particular building; it is a grand fiction, in which an attempt is made to shew how the ancient palaces and temples of Nineveh, Seleucia, and Persepolis, were adorned. The ponderous façade, with its square portals, exhibit to us the great human-headed winged bulls, the strange pillars above, with bull-headed capitals, and the bold cornice of dazzling colours. The interior has several compartments or courts, wonderfully unlike anything European; the pillars, the brilliant ceiling, and the copies from the bassi-relievi now in the Nineveh rooms at the British Museum—all are strange, and significant of the past.

**EGYPT.**—The names of Belzoni and Champollion, and a host of others, here occur to us. The constructors of this court have done much within a space of about 100 feet square. There is a small court with square pillars and lotus pillars. There is a larger court with eight colossal figures, a series of gorgeous pillars perched up on walls, and a multitude of hieroglyphics and paintings of chariots, soldiers, captives, eagle-headed men, birds, sphinxes, implements, tools, machines. There is a larger court, with pillars, and figures, and sphinxes; and a yet larger, with sixty-four columns painted in the most brilliant hues. The whole is, indeed, a sort of summary of different ages of Egyptian art, illustrated by the quadrangle of a temple, a rock-chamber tomb, a shrine of Ammon, a pyramidal gateway, a tomb from Beni-Hassan, a Nubian shrine from Ipsamboul, a cast from the Rosetta Stone. As for the grand avenue of sphinxes in the northern transept, and the two seated figures, seventy feet high, with which this avenue terminates, they must, to use a familiar phrase, 'be seen to be believed.'

**GREECE.**—Art here appeals to us under another guise. It has been said that the expression of Assyrian art is Power; of Egyptian art, Repose; of Greek art, Beauty. The Greek department is represented by three or four courts and galleries, exhibiting the simple and chaste wall-decoration of that cultivated people. Some portions of these have richly painted and gilt ceilings; but the blaze of colours is much less intense than in the Assyrian and Egyptian Courts. The charm of these courts is, however, in the sculpture. Parthenon frieze, *Ægina* frieze, Parthenon pediment, the *Laocöon*, the *Gladiator*, the *Venus de Medici*, the *Discobolus*, the numerous busts ranged around on every side—it is a school of Greek art in itself.

The Roman Courts are richer than the Greek, for art had become more ornate. We have here the arched

entrances, which indicate a change from the square lintel of the Greeks; and the wall-adornments have also undergone a change. As the Roman emperors graced their palaces with the finest Greek sculptures which they could obtain, as relics of earlier days, so do the courts of this Rome at Sydenham possess Greek sculptures as well as Roman ones almost out of number; and exterior to the Greek and Roman Courts in the nave, is a further portion of this rich collection. These compartments are especially beautiful; they are square alcoved chambers, delicately painted, and each having a *chef-d'œuvre* of sculpture in the centre—the *Venus Genitrix*, the *Apollo Belvidere*, and the *Diana*.

**POMPEII.**—What a fate was that of Pompeii! A small pleasure-town on the sea-coast, buried in ashes from Vesuvius, left untouched for seventeen centuries, and then disinterred! The Pompeian Court, which Signor Abate (employed by the king of Naples to superintend the excavations at Pompeii) has so skilfully constructed at Sydenham, is believed to be a scrupulously exact representation of a Pompeian gentleman's house; with its porter's cell, its quadrangle with a fountain in the centre, and a square opening in the roof above; its dining-hall, its baths and kitchens; its bed-chambers around the principal quadrangle. More exquisite wall-painting has perhaps never been seen in this country. Every inch of surface is painted in encaustic, with those mythological and fancy subjects which the Romans so much loved. Nothing has been slurred; it was a labour of love to Abate; and every portion of wall is a picture in itself. The fountain and the marble mosaic take us at once in imagination to the sunny clime of Italy.

**THE ALHAMBRA.**—Here Owen Jones is in all his glory. If there be one subject which this artist has studied more than another, it is the Alhambra, the palace of the Moorish kings at Granada; and if there be one thing at Sydenham more gorgeously splendid than another, it is the mimic Alhambra. Words are quite inadequate to convey a notion of the sort of decoration which the luxurious Spanish Moors adopted. The delicate pillars, the bold horseshoe arches, the pendent foliage, the Arabesque beading, the frosted fretwork, the interlacing filigree, the full-toned colours, the admixture of gold with the colours—all have been faithfully reproduced at Sydenham. There is the Hall of the Lions, with its alabaster fountain, its thirty arches supported by slender columns, its fretwork ornamentation, and its arcade all round; and there are other halls, and corridors, and chambers, the elaboration of which is not less striking.

**THE BYZANTINE ART.**—Pass we now over to the Christian side of the nave, so to speak, to see how Mr Digby Wyatt has illustrated Christian architecture. Before the period of what is called the Gothic or pointed style, a strange mixture was observable in Christian churches. The Byzantine style in the Greek or Eastern Empire, the Lombard style in Italy, the Romanesque style in France, the Norman style in England—were all made up of fragments from ancient architecture, mingled with new ideas. Mr Digby Wyatt has sought to illustrate all these curious varieties—not by a copy from any one building, but by casts and reproductions of specimens obtained from every part of Europe. Mosaics and frescoes, martyrs, saints, sauns, masks, centaurs, griffons, chimeras, Ionic volutes, Bunic knots—all are included among the decorations of this transition period. There are a cloister from Rome, a fresco by Giotto, a bass-relief from Chichester Cathedral, a door from Kilpeck church, the Prior's Gate from Ely, bronze doors from Augsburg and Hildesheim, archways with twisted columns, fountains, mosaic pavements, gilt and glass twisted pillars—a very crowd of old-world specimens. They are bewildering at first to a visitor; but when the 'Handbook' appears—there will be separate

handbooks for each and all of the courts—the riches will doubtless be set forth in intelligible order.

MEDIEVAL, GOTHIC, or call it what we may, must ever be noteworthy in a country possessing such noble old cathedrals as England; and Mr Digby Wyatt has done well to construct a Medieval Court wherein to store the vast number of Gothic casts and specimens which he has collected. It is not a reproduction of any building, or any room in any building: it is an arrangement which has enabled him to give a cloister here, an arched entrance there, a Lichfield doorway further on, a tomb from Hereford, a sepulchre from Horton, a doorway from a Rhenish castle, an alto-rilievo from Mayence, an archway from Nürnberg, an extraordinary group of dancing manikins over a portal from Munich, statues from the splendid front of Wells Cathedral, canopies, parapets, kings, saints, nuns, abbots, knights, bishops. It is now fully admitted, after much controversy on the matter, that the architects and sculptors of mediæval times employed brilliant colours very liberally in their works; and Mr Digby Wyatt has fully carried out this principle wherever, by so doing, he could better convey an idea of the original appearance of the things represented.

ITALIAN, REVIVÉ—CLASSICAL, RENAISSANCE, CINQUECENTO—all are names for styles of architecture and decoration which marked and followed the decline of the Gothic. They were a strange mingling of different elements, of which our Elizabethan was one variety, and Palladio's Italian houses were another. Mr Digby Wyatt, in two distinct courts, has sought to illustrate an earlier and a later period of this style. Strange forms of pillars, gilt arabesque ornaments, medallions placed in wreathed borders, flower garlands, are mingled with other specimens in the earlier period. The later is graced by a cast from Ghiberti's wonderful bronze gates from a baptistery at Florence—gates on which he spent twenty of the best years of his life, and in which there are ten panels full of figures illustrative of Scripture narrative. The imitation of bronze in this plaster-cast, and in another from a celebrated doorway by Goujon, at Fontainebleau, is extraordinary for its fidelity; as is likewise that of the oak-panelling and carving of another old doorway. A basso-rilievo by Donatello, a painted ceiling from Perugia, a fountain from Nürnberg, the Visconti Monument, Donatello's David and St John, Michael Angelo's wonderful sculptures from the Medici Chapel at Florence, a corridor by Sansovino, the façade of the Farnese Palace—are among the varied illustrations with which Mr Digby Wyatt has crowded this court.

The reader will at once see how rich is the artistic feast which awaits him in all these courts, any one of which is a study in itself. But this is not all. The directors resolved that industrial art should have its courts as well as fine art; and the plan they adopted was an excellent one. They selected as many architects or artists as there are courts, and gave to each one full scope for developing some one complete idea, distinct from all the others; inasmuch that, while the courts should be suitable for the display of the exhibited goods, each should be a beautiful work of art in itself. The result is most interesting; for we see how the different architects have associated their names with graceful constructions. There is Mr Crace's Stationery Court, with its bold Italian entrances, its inner cornice supported by carved brackets, and its Italian or semi-Lombard exterior. There is Mr Stoker's Sheffield Court, with its panelled walls to a certain height, and its delicate ranges of arched openings above. There is Mr Tite's Birmingham Court, with its magnificent bronze gates forming one side, and its carefully painted walls, in which little Cupids are mining and blowing, founding and forging, and imitating other departments of metallurgic labour. There is Mr Thomas's Musical-instrument Court, with its ranges

of arched openings, its bold alto-rilievo medallions of eminent musical men, its bass-relief tablets of musical instruments, and its rich concave cornice. There is Messrs Banks and Barry's Court for printed fabrics, with its arched entrances, its rich cornice, and its emblematic ornamentation. There is Mr Semper's elaborate Court for woollen goods, a sort of massive Italian in character, but completely unlike everything else in the building.

Of the French Court, of the Modern Sculpture Courts and Galleries and Avenues, of the two beautiful marble basins in the nave, of the plants and flowers which Sir Joseph Paxton intends shall shed their beauty around and among everything else, of the birds, of the stuffed animals, of the life-size figures which are to illustrate the nations of the earth, of the contents of the galleries, of the laying out of the gardens, of the grand system of water-works, of the extraordinary pre-Adamite inhabitants of the islands in the lake—of all these we say nothing. We have two reasons for this: many of the details are even yet only partially worked out; and the space at our disposal is quite exhausted. No pretence is here made to produce anything like a guide-book to the building and its contents; but we have thought that, just about the time when a royal opening ceremonial is in every one's thoughts, our readers might like to know something of the beauty, the grandeur, the artistic delicacy, the glory of the Sydenham Crystal Palace—assuredly the most wonderful attempt ever yet made to provide ennobling pleasure on terms suitable to all the world.

## WEARY FOOT COMMON.

### CHAPTER XXI.

#### THE RESULT OF THE LETTER.

In the meantime, he whose interest was at stake, whose fortunes seemed to hang upon the fate of the battle, and to whose rescue the generous artist hastened with the maddening slowness of a man ridden so heavily by the nightmare that he can only crawl when he fain would fly, was profoundly unconscious of every effort made to save or ruin him. Lord Luxton was in an agony of suspense, the very honour of his house, he thought, depending upon the delay of the letter; and yet every now and then he felt a qualm of terror at the part he had himself played, and the change of relations it might occasion between him and his indispensable daughter. Claudia was in a dream, the highest and grandest she had ever in her life indulged; but there were moments when the light forsook her eye and the colour her cheek, as some idea flashed across her brain of the possibility of accident. Robert alone was calm—without hope and without fear. He had seen Sara for the last time: the star of the Common had set forever. He pursued the business that was before him, however, with a dogged resolution. That very day he saw the master of the ship in which he was to sail, to whom it was arranged that he should render certain services in return for his passage. He would not spare himself even for an hour: but there are faculties that are not entirely the slaves of the will; and when going homewards in the evening, he knew it would be vain to summon to the literary task before him those powers of invention and imagination that are obedient only to the practised author—and not always to him. He turned away, therefore, into one of the solitary roads of the outskirts stretching into the country, where even the hum of the mighty city is unheard, and where he could watch unseen the trooping stars taking their places in the sky—no longer for counsel but for doom.

When he reached home, everybody was in bed; and after a few hours of rest, he got up and went forth again, before the other denizens of the house were astir. It was a gray, chill morning, but before he had reached the Docks, the goal of his slow and solitary walk of many miles, the sun had already some power, and the busy population had come out like insects to creep, to toil, to gather, to buzz, to sting.

After his business was finished, he turned his steps westward, and, more from habit than anything else, called at Driftwood's studio in Jermyn Street, where he had been accustomed to receive his letters. He expected no letters now, however; his association with the world was at an end; and on being told that the artist was from home, he was turning listlessly away, when the servant requested him to step in, saying that she would bring him something that had come for him by post. He took the key of the studio mechanically, let himself in, and the girl presently brought him a letter addressed in a hand he was not acquainted with. It was a blank envelope, with an enclosure folded in blank paper; and this enclosure was a Bank-of-England note for one thousand pounds.

Robert imagined for a moment that he was in a dream; then his thoughts flashed rapidly to his generous benefactor, Captain Semple; and he at once set down the gift as coming from him—an idea in which he was confirmed by the very simplicity of the veteran's contrivance. Surely no less guileless human being could suppose it possible for him, who had no other friend in the world, to be deceived by such a stratagem. But to accept a sum, the alienation of which would reduce his only friend to almost absolute poverty in his old age, was not to be thought of; and with a swelling heart he proceeded at once to the lawyer of Lincoln's Inn, not so much to have his conviction confirmed as to the source of the money, as to ascertain how it could be returned in safety to the donor. Being intimately acquainted with the captain's affairs, he knew that it was quite impossible for him to have raised such a sum otherwise than by the sale of the house-property he possessed at the Common. His first question, therefore, had reference to this point, and he was astonished to find everything in statu quo—that the captain's small fortune was untouched.

A burning blush rose into the young man's face as he made this discovery. Sara was out of the question. Her whole property was only just enough to keep her in ordinary comfort; and a wild generosity like this would diminish it by much more than one-half, for in the present state of interest, such a sum could not be realised without a serious sacrifice. It had come, therefore, from the haughty Falcontowers! It was not an acknowledgment of his services, but an alms thrown disdainfully to his poverty. He was too mean and low, as they had told him undisguisedly, for the preferment they had intended for him, and this was the indemnification his taunts had extorted from their pride. Lord Luxton, he knew, was not at that hour at home. He was at his club; and thither Robert bent his steps, with a rigid compression of his lips, and a fierce determination in his eye, which made the more nervous of the pécions shrink aside as he passed. Sending in his card from the anteroom, he determined to wait there, if it should be for hours, till the peer came forth.

But his patience was not tried, for in a few minutes Lord Luxton sauntered into the room, with the newspaper in one hand, and his gold spectacles in the other. He bowed slightly and haughtily, and, without asking his visitor to be seated, said:

'You have come respecting the letter? What is the result?'

'That is the result!' replied Robert, putting the bank-note into his hand. The peer stared.

'Will you explain yourself?' said he. 'If you have

received the appointment I applied for yesterday, well and good. If not, it is no fault of mine that the application is too late, as the ministry were unseated last night by mere accident. What is this?' and he looked at the valuable document with a surprise that could not be mistaken. Robert was confounded. He gazed into his ex-patron's eyes, and saw to the shallow bottom. There was no consciousness there. Lord Luxton obviously knew nothing of the money; and as for the appointment, that was a subject which Robert had dismissed from his mind, and he cared not a straw whether his lordship had spoken the truth respecting it or not.

'I find I have made a mistake,' said he; 'the bank-note I received an hour ago in a blank envelope, and I did you the injustice to suppose that you had taken this insulting mode of requiring the services you would not openly acknowledge. I beg your pardon, my lord—good-morning.' But as he was turning away, a new thought sent the blood once more to his brow. Claudia was generous—at times even noble-minded. Was it improbable—was it not certain—that on calm consideration she had taken a different view of the case from her father, and that she had had recourse to this truly woman-like contrivance to indemnify him, so far, for his disappointment, without betraying her own agency? The idea led him into a train of thought which brought out, and rendered luminous, various individual points in her conduct and manner interesting to his self-esteem, but till now confounded with the general mass; and Robert even fancied at the moment, that as the door shut upon his last memorable leave-taking, he had heard, amid the sound, a calling voice that thrilled through his brain, not so much like a woman's, as resembling the cry of those

—airy tongues that syllable men's names  
On sands, and shores, and desert wilderness!

Lord Luxton looked keenly at his agitated visitor; and the astute man of the world, instructed by his knowledge of the context of circumstances, read in his expression the new suspicion that had risen within his mind.

'Stay,' said he; 'I think I can assist you in unravelling this matter. A few days ago, when Miss Falcontower was at my law-agent's at Lincoln's Inn, she encountered the daughter, or niece, or something, of the gentleman by whom you were educated; and she was informed by the solicitor, that he had very reluctantly, and not without strong remonstrance, taken orders to sell as much of that young person's little patrimony as would produce one thousand pounds.' Robert sat suddenly down on a chair, for he felt as if about to fall; but when the peer, now at once reassured, stepped forward with real sympathy, he rose again as suddenly, smothering, with a mighty effort, a sob that swelled his chest almost to suffocation.

'My lord,' said he, 'I have already asked your pardon for my unjust suspicion: I now thank you from the bottom of my soul. The information you have given me cancels the debt that was between us—Farewell!' and he left the room with a steady step.

And this for me! said he to his own swelling heart, as he walked rapidly along the street—this for the outcast of the Common! My great, my noble Sara! And to think that the highest stretch of generosity I can make in requital, is to give her the pain of my rejecting her offered sacrifice, and then to desert her for ever! In the midst of his reflections he found himself, he knew not why or how, again at the door of the studio, and again he was told of another post-letter. It ran as follows:—

'DEAR BOB—You will be surprised to hear from me so soon—and perhaps you did not expect to hear from me at all. But I must write what I have to say in few words, as I shall never get through for I am not used

to it, and the pens are not so good now as we had them once on a day. Sara, besides, is not on any account to know of this, and the letter will be taken by myself to the post-office in the village—all on the sly.

'The fact is, you must come down: if you leave England without doing so—if it is only for a day or two—I shall never be able to forgive you—at least, I don't think so. Nobody can make any hand of Sara but you, for Elizabeth and I are not up to her; and she has fallen into such a lucination—I think my sister calls it that—as would astonish you. Sara, you know, has a nice little property of her own, just enough to keep her comfortable, and no more; but although this makes her comparatively rich, for she had nothing to depend upon before but the poor little trifle of pocket-money I could afford, she seems to have all on a sudden taken it into her head, that instead of rising into independence, she has fallen into the depths of poverty. Of course, she knows to the contrary, and talks grandly enough of her little fortune; but I mean, she goes on as if she was desperately poor—and, in short, dearly as I love Sara, I cannot help seeing that riches, instead of opening her views, have made her a sort of miser!

'She is up with daylight, working, working, working, when there is no need for it now. The gowns, and ornaments, and things she bought in London, she has hidden away, or else she changed her mind before leaving town, and sold them again. The new piano she ordered, and was in such a mighty impatience about, insisting upon its being here as soon as ourselves, has never come to hand; and she has taken such an affection for the old one, that used to put Elizabeth, not to talk of Miss Heavystoke, out of temper, that she says she is glad the people have disappointed her. The old gowns she had condemned she is now furbishing up, and piecing and darning; and she has refused an invitation to the vicar's, Elizabeth thinks, to save the wear of her evening-dress—if she has an evening-dress to wear.

'So you see, Bob, you must come down, and take her roundly to task in your own way. The thing is very serious, I assure you; for this sort of lucination grows upon one, and I have heard of people starving themselves to death, when they might have eaten guineas by the hundred. The poor girl, besides, is in indifferent spirits, which I dare say is a symptom; although Mr Seacole, who is here just now, does everything he can to amuse her, and sometimes takes her out to walk with him. Now do come, old fellow, for I am very uneasy. You know it was you who was Sara's master, not Miss Heavystoke; you taught her to think and feel differently from the other girls of the Common; and I am sure she wouldn't displease you in anything you were in earnest about, not for a thousand pound. So no more till we meet from

Your old friend and fencing-master,

NATHANIEL SEMPLE.

'P.S.—I hope I have explained myself; but Sara reminds me in a very remarkable way of a young ensign of ours, who was placed in precisely the same position, and fell into precisely the same lucination. No—he didn't come into a fortune, it is true; indeed he rather, as it were, lost one, and was thus reduced to live on his pay, which he couldn't do, and so was obliged every now and then to dine, as we soldiers say, with a friend in the country—that is, in a turnip-field. But I will tell you the story when you come down to the Common.'

This communication brought the nature of the love-sacrifice still more vividly into view. A sum of money is a very indefinite fact, and is regarded differently by different minds; but here we see stated distinctly the realities of which that is only in a vague and general sense the representative. Sara, by giving up her pecuniary independence, had devoted herself for his

sake to a life of toil, retirement, poverty, and self-denial. She had relinquished the pleasures of society, the triumphs of youth and beauty, the gratifications of taste—content with the secret enjoyment of having done so for him! Robert, when he had finished the letter, allowed it to drop on the table, crushed his hands together as if in an agony of physical pain, and stood trembling from head to foot like a girl. But the will of the man was strong, and his power immense. To accept the sacrifice, and thus set the comfort and happiness of Sara's whole life upon the cast, would be weakness or worse; to refuse it—to trust to the influence of years in calming the regrets of her heart, and in the meantime to fling himself headlong into the mêlée, and strive desperately, frantically, with Fortune for her blessing, even as the patriarch of old strove with the angel of the Lord—was demanded by stern, ruthless, uncompromising principle. This hardness of character, for so it must be termed, was perhaps pardonable in him—the rescued vagrant—the regenerated child of sin, guilt, and infamy—the refined and accomplished gentleman, whose heart was seared from boyhood with recollections that made him recoil with a shudder from the lightest suspicion of dishonour. But we have no intention to defend him. The human heart at the best presents a fearful spectacle; and few suspect the close and sisterly relationship that exists between the genii who govern it—Vice and Virtue.

While he was still in the midst of the agitation of the conflict, the door of the studio suddenly opened, and Mr Driftwood almost tottered in, his face flushed, and his brow streaming with perspiration.

'Where's that boy?' cried he—'never mind!' and he threw himself into the sitter's chair like a subsiding wave. 'Thank goodness!' he muttered—'I could not have done twenty yards more for my life. Oakland, this was unkind: you young fellows never think of your friends. I waited for you at Margery's last night for two hours—I did, upon my honour: I hung on to the last drop of the half-pint. Where you could have been at so untimely an hour it is no business of mine to inquire, but I fear you are not so steady as I could wish you.'

'You see me now,' said Robert, in an absent tone.

'Yes; but I ought by rights to have seen you hours ago, for I went up to Margery's on purpose as soon as it was light enough to find my way. Of course you were off. Your bed had been lain in—I suppose for five minutes, at the time when, as they say in the play, night was at odds with morning which was which; and Margery was sure you would return to breakfast. Of course you didn't; and then the old girl got alarmed, and went wringing her hands through the house as if they were to be clear-starched, and said she was sure you were off to Australia, just to dodge your destiny, escape the denowment, and break her heart. Well, well, I hope the letter will make amends for all,' and he began to search the pockets of his coat seriatim.

'What letter?' demanded Robert.

'Oh, I'll tell you about that;' and he resumed his gossiping attitude. 'You must know I looked into the Chequers yesterday, just to have a glance at the morning paper. Well, there were two individuals there, Mr Poring and Mr Slopper; and I saw the former, while the other was out of the room, fumbling with the clock—putting it back as it turned out. I am of course shy of talking to such persons, a modern master being in quite a different position; but you may guess how I pricked up my ears when I gathered from their conversation, that Mr Slopper was carrying a letter in your favour from the Falcontowers to the Home Office, and that Mr Poring was sent after him by Lord Luxton, without his daughter's knowledge, to prevent its delivery before five o'clock. Upon this point the two individuals quarrelled, and Mr Slopper, if he had not been on duty, would fain have had a tussle with the

enemy. I made a sign to him not to balk his inclination; he understood what I would be at; and, in short, when Mr Poring, with a scornful look of defiance, left the room for the back-yard, he gave me the letter, and I ran with it like a lamplighter. Well, you see, after all I was too late.'

'Too late! Did you not talk of'—

'Hush, hush! I was too late. And so'—

'If you have a letter in reply, give it me instantly!'

'Well, there it is: but don't put me out. It was after five before I reached the Home Office; but seeing a gentleman coming down the steps, I put the dispatch into his hand at a venture. He opened, read it, and looked as if he was inwardly shaking his head and bending his brows; but there was another enclosed—addressed in a lady's hand, I could see—and when he read that, he paused, hesitated, and then walked back into the office, desiring me to follow. In ten minutes I had the answer safe in my breast-pocket, and came off in triumph.' Here the artist paused to observe his friend. Robert had rapidly glanced over the missive, and it was hard to tell at first the nature of the emotion it produced. But gradually the shock assumed the character of joy and exultation, chastened with thankfulness and a kind of awe.

'Then it is all right?' said Driftwood. 'Am I to wish you joy?' Robert could not speak yet, but he grasped the artist's hand, and shook it with a vehemence that made him holla.

'Come, I say,' cried the victim, 'that will do! This is the hand that paints, and if you put it out of order, you will receive no thanks from posterity, I can tell you. But just be quiet, will you? and let me conclude. It was of course proper to see Mr Slopper, to let him know how I had succeeded, before going on the hunt after you. The Chequers, however, was overflowing, and it was some time before I could ascertain that both the champions were off. In the absence of the principals, their seconds, Jim the Potboy and Taproom Tom were the heroes of the day, and every individual who entered the house considered it his bounden duty, somehow, to treat them to drink. Their account of the duel was favourable to both parties, each praising his own man: but, to speak conscientiously, I think it was a drawn battle. However, as the evening went on, the voices of both got more and more spongy and inarticulate. The Potboy, indeed, was able to take out even the late beer, but only as a machine, for by that time he was speechless; and Tom, towards the close, performed the taproom duties pretty much like a man walking in his sleep, till he incautiously sat down and rested his head against the wall, which held him fast till the next morning.'

But the artist rattled on to inattentive ears. Robert was striding up and down the floor, like a caged lion whose every step would have been a bound if space had permitted. The suddenness of the change, in fact, almost unfitted him for serious thought. His joy for a time resembled the exultation of youth, rejoicing it knows not why, in the mere consciousness of existence. But by degrees he was able to comprehend his happiness, and at every examination the more perfect and wonderful it seemed. The official announcement of his appointment did not mention the name of Lord Luxton at all. The post was conferred upon him personally, in acknowledgment of admitted claims; and he was thus saved the contest that would have taken place in a mind constituted like his, as to the propriety of accepting a favour repented of by the patron and intended to be withheld. To whom was he indebted for a delicacy which enhanced so immensely the value of the gift? Robert stopped suddenly, as if transfixed by an arrow in the midst of his headlong strides. A thousand minute circumstances flashed upon his memory which shewed that Claudia, in the midst of all the caprices of her haughty and self-willed nature, had

indulged some gentle and kindly feeling for him; he remembered the transitory character of her flashes of temper, and the womanly and touching submissiveness with which she had on various occasions listened to his serious remonstrance; and again the calling voice at the close of the last interview shrieked in his ears, and without losing the preternatural, assumed more and more of the real. When Robert resumed his walk, it was more slowly, less exultingly.

'Well,' said the artist, who had been watching him attentively, 'have you got it over? Do you see your way?'

'Partly,' replied Robert; 'but there is nothing certain under the sun. I must now go to pay my grateful thanks where they are due; then to make poor Margery the happiest woman alive; and then'—

'Where then? You stop as if you had lost yourself somewhere.'

'Where I was once found. I must go to ascertain whether the mist has really cleared on Wearyfoot Common!'

His first visit—to the mansion of Lord Luxton—had the result he half anticipated. Not at home. A note, however, had been left for him, in anticipation of his call, and it was with profound emotion he read the cold formal words it contained, written as usual by Claudia, and as usual in a calm, clear, flowing, unimpassioned hand. It ran thus: 'Lord Luxton and Miss Falcontower congratulate Mr Oaklands on having obtained his appointment. They regret being unable to do so personally, being on the eve of setting out on a foreign tour.'

Mrs Margery was in reality made the happiest woman alive—and the proudest. The beginning, at least, of the dénouement had arrived, and although this was somewhat different from her prophetic anticipations—what about it? Was there not position, fortune, independence, and what more would you have in the cards? A marriage, of course. That she had known from the very beginning; that would come next as sure as fate; and that would end the dénouement. What a cheerful tea they had, to be sure! and how grand Mrs Margery was, with a cap that was the ne plus ultra of clear-starching, and her best china on the table, not to talk of the thin bread and butter and the hot muffins, with their own delicate taste enriched with the freshest of fresh butter! As Doshy—who was not long out of the secret—looked at Robert, her eyes imitated the astonishment of Molly's; and she would not for the world have sat down in his presence, even in her customary place near the door. After tea, however, he hurried away from his triumphs to the terminus at Euston Square; and in due time was rushing, at a speed more than three times that of the best appointed stage-coach, towards Wearyfoot Common.

'Mr Seacole does everything he can to amuse her, and sometimes takes her out to walk with him.' These words from the captain's letter, Robert kept mechanically repeating. What harm was there in them? He did not know. Sara was in the very midst of her love-sacrifice for him; he knew her nature to be full of truth and nobleness; and yet the words came again and again, like some air one cannot get rid of. As the night wore on, however, and he came nearer and nearer the part of the country where his fate was to be decided, the unreasonable sound was gradually drowned in a sweeter, loftier music. He pictured to himself the beautiful shame of Sara when she found that her secret was discovered—her passionate surprise when her gift was gratefully accepted—and her generous delight, untarnished by a thought of self at the moment, when she knew the rich and honourable fortune that had been showered upon her lover. His reflections were hardly interrupted by the slow pace to which the headlong speed of the train declined as they were arriving at the last station; but he turned his eyes mechanically

towards another train that was just leaving the place on its townward journey. A traveller was at the window gliding slowly past him, and the recognition was mutual. The face of the one was radiant with joy; that of the other was illumined with a glare of rage and mortification. This was the last look that passed between Robert Oaklands and Adolphus Seacole.

### ASPIRATION AND ACHIEVEMENT.

ONE evening in the spring of 1819, Thomas Moore wrote in his diary as follows:—‘The sunset this evening was glorious: the thoughts that came over me while I looked at it, of how little I have done in the world, and how much my soul feels *capable of*, would have made me cry like a child, if I had given way to them; but surely there is some better sphere for those who have but begun their race in this.’ The discrepancy between aspiration and achievement here expressed, is a thing which has been frequently lamented: most persons of any sensibility have at some time been troubled with a sense of it; yet notwithstanding all the manifold regrets it has occasioned, nobody appears to be benefited by the contemplation of former failures, but every new adventurer in the pursuits of life repeats the old experience. To a limited apprehension, it would seem as if the greater part of the existence here allotted us were little more than an apprenticeship to the business of living; and that if ever we come to understand our authentic position and relations in the world, and how our time and talents might have been wisely and most effectually employed, it is at a stage of life when the journey is drawing to a close, and hardly an opportunity is left us to turn what we have been learning to account.

Are we to suppose, then, that the life of man is essentially a failure? Were we created but to be baffled in our efforts to accomplish what all our instincts and intuitions urge us so imperatively to attempt? Plainly enough, men everywhere fall short of what they hope for, and what they aim after; it is the universal lamentation that the promise of existence is never realised; but are we, therefore, to conclude that life is utterly a delusion, and that it is impossible to achieve the objects which, as active and discerning beings, we seem destined to pursue? Is it rationally conceivable that we are doomed by an inexorable Necessity to spend our strength in vain, and, in aiming to reach the heights of our desires, must for ever advance only to be prostrated by the force of hostile circumstances?

Life can never have been enforced upon us on such unfair conditions. That which we have been sent into the world to do, we are assuredly competent to perform. The Ideal of our existence undoubtedly admits of being wrought into a practical result, of taking shape and embodiment as a satisfactory realisation. What the Divine Power has proposed as the end of human life, that, in the nature of things, must be actually attainable: for it is held as a fundamental principle, that God has ordained the wellbeing of humanity; and if this be a right conclusion, it must also be admitted that men are endowed with such capacities as are needed for the fulfilment of the divine intention. Without this adaptation of the constitution of human nature to the order and arrangements of the material creation, and to such moral conditions as men are appointed to be conformable, there would be no happiness or wellbeing possible to mankind: men would be as unrelated aliens in the universe, cursed with faculties which they could not exercise, and exposed to an unequal conflict with external powers, which must end only in their own confusion and defeat. Thus their destiny would be one of unmitigable misery: not the welfare, but the everlasting perplexity and despair of

the human race would seem to be decreed; and over the portals of existence might be written, as above the gates of Dante's hell—

Abandon hope, all ye that enter here!

It is our faith, at least, that God has built the world and created man for an end worthy of himself, and that in his wisdom he has not failed to provide the means by which the end may be accomplished. Undoubtedly, the powers of humanity are equal to all the tasks and duties required of it, and to the ultimate attainment of the grandest destination. In himself are centered all the attributes and faculties which, being appropriately developed, are essential to a man's practical wellbeing. No portion of his constitution has been assigned to him without its corresponding use and adaptation. His wildest desires only indicate the range of his capacities. He has no thought or hope which points not to a possible accomplishment. He is born for the exercise of power, for conquest and dominion over the forces of external nature, for the command and government of his own riotous propensities, and for the general discernment and adoption of truth, order, and perfection. Small as he may look against the mass and incommensurable variety of the universe, he is invested with a potency of intellect and will which, considered in its results, may be justly pronounced august, and even splendid. Look how, through successive generations, he has changed the face of the visible creation: how different the aspect of the world since the days when the race began first to explore and work in it! The aggregate of achievement here is literally incalculable! It was not all barren, that toil and enterprise of the foregone years and ages which we briefly denominate the past. Through difficulty and danger, man has wrought and suffered, and left imperishable works behind him. The visible realised world of towered cities, of nations, monarchies, republics, and other manifold institutions, are all the product of his expansive brain and active hands, and, defective as they look in some respects, are grand enough to do him honour. Let us not disparage this wondrous being in whose image we are formed, and whose glorious breath we breathe; nor deny to our buried ancestry the homage which befits that worth and excellency whose memorial-stones are standing where last they worked and fell. For the habitable globe is in some sort the shrine and temple of the departed ages, and therein is gathered all the suffering and laborious dust that was spent in building it to the height and circumference of its visible magnificence!

Man, we repeat, is great, and equal to the destiny before him. Doubtless, in past times, he has consumed many errors, and in every successive day of his prolonged existence he is still liable to mistake and failure; but, taking the measure of his blunders over a reasonable range of time, it will be seen that he steadily advances. The errors of 500 years ago were something very different from the ordinary shortcomings of to-day. A constant progress is visible in the ideas, the institutions, and moral tendencies which successively take possession of the world; and through the prevailing influence of the ascendant principles, our humanity goes forward towards the perfecting of its nature. Whatsoever seeming retrogressions there may be, in the final comparison of the ages there is an undeniable advancement. And this is the consequence of an increasing and clearer knowledge of the ordained conditions of human life, and of a more strict obedience to the laws by which our existence is overruled. A perfect conformity to those conditions would result in the actual realisation of human welfare. Man would be no longer frustrated in his strivings after happiness, but in mind, body, and estate he would reach the full completion of his powers, and derive from their employment a whole and perfect satisfaction.

All shortcoming and imperfection in the ways of

human life, are the consequence of an insufficient adaptation of our nature to the appointed conditions of wellbeing. As an acute thinker has observed: 'Every suffering incident to the human body, from a headache up to a fatal illness—from a burn or a sprain to accidental loss of life, is traceable to the having placed that body in a situation for which its powers did not fit it. Nor is the expression confined in its application to physical evil; it comprehends moral evil also. Is the kind-hearted man distressed by the sight of misery? Is the bachelor unhappy because his means will not permit him to marry? Does the mother mourn over her lost child? Does the emigrant lament leaving his fatherland? Are some made uncomfortable by having to pass their lives in distasteful occupations, and others from having no occupation at all? The explanation is still the same. No matter what the special nature of the evil, it is invariably referrible to the one generic cause—want of congruity between the faculties and their spheres of action.\* To diminish the evil or discomfort of their situation, whatsoever the situation may chance to be, men must approach closer to the ideal law of their constitution—must seek, in short, to adapt their aims and purposes to the unchangeable conditions on which human welfare, and the success of its varied interests, are in the nature of things dependent.

From the platform of this idea, we are readily enabled to apprehend the uses of aspiring inclinations. Their very presence in the mind would seem to indicate a natural and effective function; and this, on consideration, will be found to be the fact. The office of aspiration, as we take it, is to stimulate exertion, to induce the man to unfold the powers that are latent in his nature, and thus to bring him eventually to a state of mind and character whereby the ends of his creation may be answered. Whoever earnestly desires to accomplish anything of eminent note or service in the world, may be usually considered as thereby giving token of a probable capacity in that direction. The capabilities of man foreshadow that which he should do: every tendency within him has reference to the ends of his existence, and may be developed to the extent of its limitations, in working out the purposes of a rational activity. The nature of this activity is indicated by the leading aptitudes of the individual, which ought to determine the specialties of his education, and direct him toward pursuits in which he can most effectually manifest his powers. By endeavouring to realise his aspirations, he will best fulfil the objects of his being. To every man it may be said: Follow thy genius, that glowing lead-star of thy destiny, and it will shine on thee as thou journeyest with a never-fading radiance, and guide thee through all untoward and perplexing paths, to the vocation and the duty which befits thee! Our life is so marred and fruitless, because we miss the work that is most appropriate to our faculties, or perversely labour in the pursuit of objects that are not accordant with the authentic ends of our existence. Could every man apply himself to employments which are most suited to his capabilities, and, in his appointed calling, work only with a view to serviceable, sincere, and ennobling results, the measure of his achievement might still perchance fall short of his original aspirations; but, being commensurate with his powers, and conformable to the eternal laws, it could not fail to yield him that assurance of security and contentment which by necessity proceeds from all faithfulness of action. As the very extravagance of our desires is designed to serve a purpose in our constitutional economy, it will be found eventually that the aspiration is no further in excess than is requisite for securing a sufficiency of achievement—that the one transcends the other just as the highest wave of the tide dashes

further upon the shore than the rest of the waters will afterwards advance.

That discrepancy between the desire and the accomplishment, which was noticed at the beginning, in so far as it implies actual failure of performance, is the plain and natural consequence of a non-observance of the conditions of success. Aspiration may be misdirected; as when a man, under the influence of vanity or ambition, aims to achieve something beyond the compass of his faculties; or when actuated by impure and contracted motives, he seeks after a selfish or debasing gratification. If, after years of painful and unrewarded effort, he should find all his plans of aggrandisement or pleasure unsuccessful or unsufficing, it becomes him to understand that he has been working in wrong directions, for objects and purposes that have no reference to his individual wellbeing, and which are therefore incapable of yielding him any abiding satisfactions. It is not for him to complain of the emptiness of life, or of the delusiveness of human expectation; for his perverted existence has had no substantial hold on Nature; and her recompenses are stringently reserved for such only as live in conformity with her laws. Had he lived for Nature's ends, and thus partaken of her benefits, he would not have profaned her majesty by questioning the perfection of her ordainments. The wisdom and celestial beauty that are in her would have won his love and admiration, and thrilled his soul with a sacred and impassioned thankfulness. Working in accordance with her tendencies, he might have realised whatever hope or yearning was grounded in his character, and made his life the manifestation of his noblest aims and strivings. When a man is true and faithful, 'his ambition is exactly proportioned to his powers.' He will aspire only after that which is possible to his genius, and be content with the result which he can wring from his best exertions. Nothing more can be required of him; and by nothing less can he be justified at the tribunal of the universe. Yet let us not account too much of the offences of error and shortcoming which needs must happen while we remain in this probationary state; for these are often but as the casual falls and stumblings of a runner well intent upon the race; and the goal of well-doing may be reached, and the prize achieved, notwithstanding the accidents of the course. When the inner purpose of a life is true, it will not be materially impaired by occasional details of defect. From the divine act of repentance a profounder faith may spring, and, through renewed effort and persistency, the lost ground may be recovered. A man will not advance himself by indulging in unavailing retrospections, nor anywise better his estate by deploring his instability. The authentic objects of his life are to be gained only by present action, by doing here and now that which has hitherto been left undone, and thus progressively atoning for the deficiencies of the past. Neglected opportunities may never again return, but always the possibilities of to-day are such that at least something may be done. By steadily pursuing the Ideal, when the soul is once open to discern it, a man undoubtedly ascends nearer to that perfection for which his awakened nature longs, and in the round of his development fulfils his appointed destination.

And there is finally, as Moore says, the consideration that some other sphere awaits us, where perchance we may start on a new career, instructed by the experiences of this, and be permitted to work out our incomplete endeavours. The soul, in its yearning after a perfect life, and an unending blessedness, instinctively believes in immortality, and earnestly looks thitherward for the consummation of its hopes. Wondrous and beautiful as is this our sublimary existence, considered as a scene for labour, discipline, moral culture, and reasonable enjoyment, it is yet so circumscribed by pains and dangers, so interlarded with cares

\* Herbert Spencer's *Social Statics*, p. 59.

and sorrows, so perplexed by doubt and difficulty, that altogether it would seem to suggest to us the need and certainty of another state, of larger and less encumbered adaptations, wherein the enfranchised soul of man may act with greater liberty, and realise more commensurate and enduring results. How grand a consolation does such a faith afford us! Whosoever in this hour groaneth under intolerable burdens, to him it gives assurance of an ultimate liberation. Under whatsoever hardship, privation, or disappointment it may be thy present lot to suffer, a day is coming when it will all be ended; when thy battered argosies of adventure on this troublous time-element shall be anchored in eternal harbours, and thyself landed on the unchanging shore, where the sky is never ruffled by storm or cloud, and the unobstructed sun shines on in splendour and serenity for ever!

### PRISONERS OF WAR.

PRISONERS of war! Alas, how many hearts were almost daily wrung at that brief announcement of the fate that had befallen those dear to them during the great struggle which terminated forty years ago! We, of a later generation, know little of the meaning of the words beyond what we have learned from books, and in conversation with those of our seniors who yet survive, to relate their sad and thrilling reminiscences of the last European war. Once more, three of the greatest powers in the world are engaged in conflict; but the whirligig of time brings about strange changes; and England and France, no longer deadly enemies, fraternise to chastise the mighty northern power which so materially aided Britain and her allies in consummating the overthrow of Napoleon the Great. Ere long, it is almost a matter of certainty that thousands of prisoners of war will be made on both sides; and without speculating at all as to their probable treatment, it will be interesting to refer to the condition of such victims of what our gallant Gallic friends coolly call *la fortune de la guerre*, towards the termination of the last general war. In doing this, we are, of course, not actuated by the slightest desire to resuscitate slumbering or forgotten national animosities—we merely wish to convey a little information on the subject as a matter of history. We have taken some pains to gather materials of a reliable nature, and believe that whatever we have occasion to state, may be received as generally authentic.

Among our earliest personal reminiscences is one, which, although trifling in itself, is yet significant and pertinent to our present theme. Our mother had a curious work-box, composed of flattened and stained common straw, glued on thin slips of deal, in a very ingenious and elegant fashion; and much did it excite our admiration when a child. To our inquiries respecting it, she told us that it was wrought by one of the French prisoners of war confined—if we remember aright—at Weedon Barracks, in Northamptonshire—a famous dépôt for these unfortunate men, several thousand of whom were at one time incarcerated there. The French are proverbial for their ingenuity; and when prisoners of war, they were accustomed to fabricate, out of the commonest materials, an immense variety of pretty little articles of utility or ornament. The work-box alluded to was made from a bit of fuel-wood, and the straw of the poor captive's bed; and many highly ingenious toys and knickknacks were fashioned, we have heard, out of the larger meat-bones

which the prisoners' teeth had previously well polished. The painful tedium of captivity was mitigated by these employments, and the articles produced were sold to visitors; the money thus earned enabling the prisoners to purchase the comforts and necessities of which, in many instances, they were in pressing need. It was generally remarked at the period, that the bulk of the English prisoners of war in France never turned their hands to any account in a similar way, and hence it was broadly inferred that the English were decidedly inferior in ingenuity and industry to the French. This is only partially true. In the first place, those English soldiers and others who had been bred to sedentary or handicraft trades, such as tailoring, shoemaking, cabinet-making, &c., pursued them in captivity, if circumstances permitted; and secondly, we are assured on very excellent authority, that it was useless for those prisoners who were not of any regular trade, to exercise their skill in the same way as Frenchmen did in England, for the simple reason, that there was no market for their productions, as the French people living near the dépôts were too poor to purchase such things, or were indisposed to do so. Otherwise, knowing as we do how ingenious and quick to learn any light kind of handiwork English sailors usually are, we feel confident that they, at least, would have preferred earning a little pocket-money to spending their time in idleness. We recollect reading in the newspapers, that a certain noble English duke not long deceased, had the misfortune to be detained a prisoner of war in France for the space of four years, and from some cause not being able to obtain remittances from his friends, he is said to have actually learned tailoring, and by the exercise of shears and needle maintained himself! Whether this is true or not, we cannot say; but at any rate it is certain that many English gentlemen were compelled by circumstances to labour in different ways for their support during a detention which in some cases lasted nearly a dozen weary years.

Towards the conclusion of the war, the number of French prisoners in Great Britain averaged at least 70,000. Of this immense body, many had been captives from the renewal of the war—after the brief and delusive peace of Amiens—in 1803. The majority were of course sailors and soldiers, the civilians being chiefly passengers taken in ships. Officers, and civilians entitled to rank as gentlemen, were allowed to reside on parole within assigned limits and on certain conditions; and if they did not sanguinely anticipate a speedy termination to the protracted war, they at least looked forward with hope to the possibility of being exchanged for Englishmen of corresponding rank, prisoners in France; and as they were generally kindly treated and well received in good society, their position, although painful to men of spirit who longed to distinguish themselves in their several professions, was at least endurable, and, in some few cases, happy enough. One French prisoner of high rank, whose name we cannot at this moment recall, was, during the greater period of his detention, an honoured guest of the Duke of Devonshire, at his princely seat of Chatsworth, in Derbyshire; and on subsequently visiting the duke, after the conclusion of the war, he is said to have declared, that the happiest period of his life was when he was a prisoner on parole in England. From 1803 to 1814, several hundreds of French commissioned officers broke their parole, and escaped from England. The number of English officers who acted in a similarly discreditable manner, and escaped from France, was proportionately much smaller. The common soldiers and sailors were of course not admitted to parole, but were confined in barracks and prisons, where they managed to beguile the tedious hours of captivity—which in their case was anything but a light affliction—by games of amusement, and by occupying themselves as they best might in the little industrial

employments before mentioned. From 1803 to 1814, both inclusive, 122,440 French prisoners were brought to England (the majority came in 1808, 1809, 1810); and of these, 10,841 died in prisons; 17,607 were exchanged, or sent to France invalids on parole; and the residue were liberated at the peace.

As to the distribution of these prisoners in dépôts, it will suffice to record that, in September 1818, fourteen prison-ships at Portsmouth harbour held 9227; Fortune Prison, near Portsmouth, 3972; Dartmoor Prison, 6572; and other large prisons, each contained several thousands. The French prisoners dreaded nothing more than to be put on board the hulks or prison-ships, for many doleful and ridiculously exaggerated pictures of the condition of captives in these vessels were industriously circulated by French writers; but in reality, the treatment of prisoners on board them was far from intolerable. Some degree of severity was unavoidable, but the prisoners were humanely treated on the whole, and their allowance of food was larger in quantity and superior in quality to that of English prisoners in France. The prison-hulks were great ships of the line, and were cleared of all obstructions on each deck, so as to be as roomy and airy as possible, and they usually received 600 to 800 prisoners each; so that, even adding the guard, a three-decker, clear of all lumber, might contain some 900 men without much overcrowding. The officers in charge paid great attention to keeping the decks clean and dry, the prisoners' bedding well aired, and the ship thoroughly ventilated; and the result was, that the number of sick at one time did not average 2 per cent.—much less than in many of the prisons on shore. We do not mean to deny that French prisoners occasionally suffered cruel and indefensible treatment; but such cases were exceptional, for the government issued strict and minute orders for the due control and humane regulation of the unfortunate captives. Much would, of course, depend on the personal character of the chief officer in charge of a hulk, or the governor of a shore-prison; for if he were a harsh and cruel man, he could, and, we fear, in some instances, did render the existence of the poor fellows committed to his charge miserable in the extreme. We conclude this part of our subject by mentioning, that the dress worn by the French soldiers and sailors in our hulks and prisons, and in which the majority of them returned to their own country, consisted of coarse yellow trousers and jacket, and a red waistcoat; this degrading species of uniform being adopted to lessen their chances of escape, by rendering them easily recognisable.

Now let us cross the Channel, and see how matters were managed in *la belle France*. We never met with any reliable account of the average number of English prisoners in France during the last war, but believe that 20,000 or 25,000 may be taken as the maximum; and of these a considerable number were travellers and temporary residents, who were most unjustifiably detained by the great Emperor, whose conduct in this respect naturally has excited much indignant comment. These *détenues*—officers of the army and navy, masters and mates of merchantmen, and passengers in the latter—were all admitted to parole in France under certain restrictions. English prisoners, both those admissible to parole and those doomed to personal confinement, were sent to fortified towns far in the interior—in some cases, even under the shadow of the Pyrenees—in order that distance from the coast might reduce to the minimum their opportunities of eventual escape. Yet, in spite of this, not a few did contrive to triumph over every obstacle, and reach England after many hardships and dangers. All prisoners were escorted to their appointed dépôts by gendarmes, who, by the way, were fine picked soldiers, who had seen much service in the army, and were of two classes—one *à pied*, and one *à cheval*. Owing to the distance of most of the dépôts from the coast, the journey of the

prisoners—generally performed on foot—often occupied many days, and was accompanied with every species of hardship. Moreover, these gendarmes were nearly always severe, and often brutal, in the exercise of their plenary powers. They not unfrequently handcuffed the prisoners—officers, men, and passengers indiscriminately—and compelled them to march under this degrading restraint, being themselves held responsible for the safe delivery at the dépôt of all intrusted to their charge.

Prisoners on parole were free in the town assigned for their residence—having merely to report themselves and attend muster, and be ever at hand when required—but were not allowed to wander in the locality beyond assigned limits, or to be absent during the night. If they transgressed, their indulgences were restricted, or altogether withdrawn; and if they attempted to escape—committing the moral crime which stigmatised them as *evadés de parole*—and were retaken, they were usually sent to share the hard lot of the common prisoners. Otherwise, if they conducted themselves properly, they had little to complain of on the score of personal treatment, for the French bourgeois, generally, behaved towards them with kindness and cordiality; and not a few sprightly French demoiselles gave their hands in marriage to English officers and detainees. The French government allowed them about L.1, 5s. per month, which, of course, was very inadequate for their subsistence; and those who had not friends able to remit them money from England, were sadly off. The majority, however, were in receipt of frequent remittances from home, and they liberally subscribed to a fund for the relief of their poorer fellow-captives on parole. The French government made regular allowances to all officers. Colonels and post-captains, for example, received about L.4 monthly, and other officers of the army and navy in proportion to their rank. Masters and mates of English merchantmen, and passengers taken prisoners in the latter, received from their own government as much as the French assigned them nominally for subsistence. Altogether, considerable sums of money were circulated in the towns where English prisoners were confined; and we daresay that the shopkeepers would have reason to regret the day when peace released their British customers. What the allowance to French prisoners in England by their own government was, we are not aware.

The common prisoners were rigorously confined within the walls of fortresses, and, in some instances, had real reason to complain of the wretched accommodation assigned them in the shape of lodging. Those who were aged, or of weakly constitution, or wounded and broken-spirited, were soon released from their sufferings by death. The prison allowance consisted of brown—or rather black—bread, a small portion of poor meat and vegetables, soup maigre, &c.; and the pay in money was a sou and a half—not quite three farthings—per diem. From a fund raised by public subscription in England, they also received the sum of one penny daily; and the masters and mates of merchantmen participated in this small but welcome addition to their means of subsistence. As brandy and other spirits were exceedingly cheap, they frequently contrived to get intoxicated, and altogether were most refractory gentlemen, giving endless trouble, in every conceivable shape, to the incensed officials in charge. Amply did they sustain the proverbially reckless character of English seamen, and in the shape of work they did nothing whatever but make a few articles for their personal use. Their time was spent in playing rough games of every description, singing, speechifying, fighting, drinking, and taunting and defying the French frog-eating mounseers, all and sundry, who, by the by, often made them rue their mad pranks. Insubordination was commonly punished by separate confinement,

with bread and water; and, worst of all, and unendurable to English Jack, a total deprivation of tobacco—far harder for his philosophy to bear than the stoppage of his grog! But any personal assault on the soldiers or the gendarmes was a most serious offence, the punishment of death being assigned to the crime of striking a gendarme; and in some instances this terrible and outrageous penalty was actually carried into effect! The prison-dress consisted of gray jacket and trousers, and a straw-hat. From one cause or other, all classes of prisoners, including detainees and officers on parole, were liable to be suddenly removed to a different and often very distant *dépôt*, which was always a severe punishment in itself, owing to the hardships invariably endured whilst *en route*. Many prisoners died on the way during these removals.

The limits we have assigned ourselves for this article will not permit us to enter on further details concerning the condition of prisoners of war in France, and we now proceed to say a little about the treatment of common prisoners of war in another country at the same period. Subsequently to the terrible, and, in our private opinion, unjustifiable, bombardment of Copenhagen in 1807, a considerable number of prisoners—consisting chiefly of the crews of British merchant-vessels, and men-of-war's-men captured in boats belonging to their respective ships—fell into the hands of the naturally exasperated Danes. Most of them were captured in the Sound, the Cattegat, and the two Belts, and they appear to have generally been sent in the first instance to Copenhagen, which was yet smoking in ruins from the effect of British shells and Congreve-rockets. During a personal sojourn at Copenhagen, we have literally felt our blood thrill with shame when the Danes described to us the devastation thus effected by our countrymen long time before we opened our eyes on this troublous world. We mention this, because it shews the Danes had unusual cause to receive British prisoners with angry and bitter feelings; yet, to their honour be it spoken, they treated their captives with humanity, and avoided all measures of unnecessary harshness.

At Copenhagen—where the cost of living was then high—the English prisoners were allowed 1s. daily to provide themselves with food; but on being marched to Randers and other *dépôts*, their pay was reduced to 5d. per diem. Small as this was, we believe it was quite as much as the Danish government could afford; and it must be borne in mind that provisions were then, and are now, very cheap in small remote towns of Denmark. Nevertheless, the prisoners fared but scantily, as they had to employ contractors to supply them with food for their money; and we may perhaps safely assume that the commissaries did not neglect to squeeze a considerable profit out of the pay. The food they furnished consisted of Danish black rye-bread—which we can testify is very wholesome and nourishing stuff—milk, pease-soup, beef and pork, fish, &c.—all good enough, but insufficient in quantity to satisfy a hungry English sailor, who is invariably blessed with a keen appetite and unlimited power of digestion. Those who had any money in their possession at the time of capture, or who subsequently received remittances from England, of course could procure whatever food or necessaries they required, but the great majority were penniless.

Above 300 sailors were confined at Randers in a sort of brick barrack of two floors, each consisting of a single large room. It may be readily conceived that extreme inconvenience and misery resulted from the confinement of 150 men crowded together night and day in a single room. Some slept in hammocks, and others on strawbeds on the floor. Stoves warmed the room, and wooden seats were provided for the use of the prisoners, whose health suffered principally from the bad ventilation. During the day they were allowed exercise, if

the weather permitted; but, on the whole, they were on short allowance of fresh air, a deprivation which sailors, of all men, feel most severely, as they are accustomed to spend their lives inhaling the pure open sea-breeze. Another cause of suffering was that of being miserably supplied with clothing for so cold a climate; but the Danish people in the neighbourhood kindly gave all the clothes they could spare to the prisoners, and sometimes subscribed to furnish them with extra rations and indulgences, and in various other ways manifested great humanity. We regret to have to add that, as a body, our captive fellow-countrymen behaved very ungratefully towards the sympathising Danes, whom they robbed and outraged on several occasions in a most discreditable manner. Nor was their conduct to one another any better. The life they led in prison reflected little honour on their country in any respect. They were perpetually quarrelling, fighting, gambling, and occasionally misconducting themselves so outrageously, that the severe punishment of ringleaders became absolutely necessary to restore anything like order. The quiet, phlegmatic Danes were scandalised and amazed at the behaviour of their incorrigible captives, and were much more anxious to get rid of them on any terms than to keep them, for, as nearly all were penniless sailors, they of course brought no money into the country, but cost it money to keep them, which Denmark could very ill afford. To such an extent did the gambling spirit, especially, prevail among the sailors, that they would stake their pay, their rations of food, in advance, and even the clothes they wore on their backs. One fruitful cause of fights was the frequency of theft among them—the law of *main* and *trunk* being held in very little respect. They were not ashamed to beg regularly, and importunately of the poor country-people, or of visitors, and would do almost anything to raise means for a debauch. The quieter among them spent their time in spinning interminable yarn, singing patriotic songs, reading the few books in the possession of the prisoners, or making articles of wearing-apparel for their own use. Most of the prisoners taken by the Danes at this period, appear to have been released in the course of a year or eighteen months, only to be delivered up to English men-of-war cruising in the Sound or the Belts, on board which ships of King George they were immediately asked to enter, or, if they refused, were kept as pressed men, and subjected to a discipline which would perhaps make some of them sigh for the idle licence of a Danish prison, in spite of its poor rations and worse lodging. We may remark, that although the English sailors made repeated efforts to escape from Randers and other *dépôts*, they were unsuccessful in nearly every instance, being soon retaken, and brought back to prison, where they were generally flogged, for the benefit of example, and the liberty of themselves and their fellow-captives was still more restricted for the future. In France, also, the escape, or even the attempted escape, of one or two out of hundreds of prisoners, invariably caused the whole number to be punished by severer restraints. Common prisoners of war are almost sure to become thoroughly demoralised during their captivity.

In conclusion, it appears to us that the lot of a prisoner of war, even in its mildest and most humane form, is a grievous misfortune, especially if the war proves protracted, and the prisoner is not soon exchanged or sent home invalided. Nor is the mere fact of being a prisoner—sad, degrading word!—even with the amelioration of being on parole and supplied with money, so trifling a misfortune in itself as some may imagine. It is a very trying thing to feel that your personal liberty is restricted, that you ~~must~~ live within certain assigned bounds, and be at the beck and nod of possibly insolent officials, whose government can order your removal to a distant *dépôt* at a moment's notice, or, for any act of carelessness or evasion of parole, out

your part, reduce you to share the miserable lot of common prisoners of war. Reader! we beseech your sympathy and aid in behalf of the poor prisoner of war, no matter whether he is Englishman in Russia, or Russian in England.

##### THE LIBRARY.

*Memoirs and Political and Military Correspondence of King Joseph.* By A. Gu Casse. Vols. II. and III.—It is curious to examine the correspondence between a great genius—who had raised himself from a subaltern to an emperor, and from being unable to get credit at a pastry-cook's shop at Valence on the Rhône, to holding all Europe, excepting England, at his feet—and a weak-brained man whom he set upon a throne merely because he was his brother. Not one of Napoleon's instructions to king Joseph was ultimately carried out. The principal, indeed the whole of the interest of these pages, lies in the Emperor's dispatches. It is evident that he finds that he must think for both. For himself, he says he has a habit of thinking for himself 'for three or four months before, and always preparing for the worst'—a striking proof of Napoleon's mental powers and determination. His dispatches are usually curt, and most emphatically to the point. The coolness with which he points out to his brother the manner in which he is to go about seizing the crown-lands, the family fiefs, and the property of the monks, by diminishing the number of convents, is amusing. He counsels him to range around him one hundred generals, colonels, and others, and settle upon them and their families the plundered fiefs, both of Naples and Sicily. He thinks that both Bernadotte and Massena ought to be fitted with large fiefs that would set up themselves and their families. This scheme he would adopt for Piedmont and Italy, and between these countries and Naples there would result a fortune for three or four hundred French officers, all holding by primogeniture. In a few years, the French families would intermarry with the great families of the country, and the crown would be so firmly established, that Joseph could dispense with a French army—a point at which it was necessary to arrive.

But though Napoleon could see through three or four months, and be prepared for the result, he could not see so readily through a few years. He writes to his brother, that Prussia, in spite of its protestations, 'shall be crushed or disarmed.' As for Russia, he did not care what it liked—it 'was too distant to be hurtful.' These last few words convey a striking proof of how signally Napoleon's passionate ambition overcame his reason. Prevented from attacking England by Trafalgar, he suddenly dashed at Russia, which 'was too distant to be hurtful.'

*Ladak; Physical, Statistical, and Historical, with Notices of the Surrounding Countries.* By A. Cunningham. Allen & Co.—Here we have a sort of fairy-land, where, amid mountains of everlasting snow, you find, during the short summer, barley and wheat fields, and even such delicate fruits as apricots. In the comparatively small district of Ladak, the inhabitants are divided into four races, speaking different languages, holding different faiths, and practising different manners and customs. They are fond of ornaments and decorations, and are exceedingly convivial—singing and dancing mingling in all their festivities. A striking feature among the poorer classes in Ladak is—that one woman has several husbands, who must be all brothers. The rich, however, like other people in that region, have two or three wives. In respect to the Ladak shawls, the best kinds are sold at from L.10 to L.60 per pair. About 5000 of all sorts are generally exported on the

backs of the Tibet sheep; indeed, all the merchandise of the country is carried down by them to Yarkland, a central market-place.

One of the dreadful scourges of Ladak is the occasional formation of a huge glacier, high up among the mountains, and in the course of the Indus. This first dams back the water of the higher Indus, until it accumulates into a great lake, and then, unable to stand the pressure, and partially melted by the heat of the summer and the earth, it suddenly bursts, and lets loose a roaring wall of water through the steep valley of the river. The worst of these fearful inundations was the last, which took place in June 1841. First, there was heard a low murmuring among the mountains, which gradually increased, until some one said: 'Look, it is the river!' and suddenly it was perceived that the river was racing furiously down in an absolute wall of mud, carrying with it a whole camp of soldiers, peasantries, tents, domestic animals, furniture, huts, trees, and everything that was movable. In Kadak, it swept off all the villages, trees, corn, and, in fact, all the property, and much of the arable soil, and then went roaring and spreading down into the low country, bearing desolation across the whole continent of India. In Ladak, most of the inhabitants escaped with their cattle up the hills; but below, the loss of life was as much as that of property.

The public are much indebted to Major Cunningham for this work. It depicts, not in a very literary style, indeed, but with great minuteness, and in the greatest detail, the entire features, physical, moral, and social, of Ladak.

*Modern German Music, Recollections and Criticisms.* By Henry F. Chorley. Smith, Elder, & Co.—This gentleman is well known in the musical world of London, by the peculiarity of his musical opinions, the fantastic nature of his phraseology, and his determined system of opposition on some point of harmony, melody, or general style, to every foreign musician except two—Mendelssohn, and a certain pianoforte playing Dr Liszt. Beginning with Bach and Gluck, he proceeds in a tone of condemnation through the whole bead-roll of immortal genius, including Spohr, whom he rails at most unmercifully, without understanding him, and Beethoven, on whom he pronounces the following judgment, apropos of the quartets of the 'third period,' the most glorious of the series, to those who understand them:—'His ear had ceased to be able to keep account of or keep watch over the limits which separate sonority, suspense, and cacophany.' Of Mozart he says, that 'there is no single work by Mozart in any style than which some other single work, having greater interest, by some other composer, could not be cited.' These sentences suffice to shew the general tone of Mr Chorley's book, from which, however, we are happy to except his 'Last Days of Mendelssohn.'

Professor Wilson of Edinburgh is dead. The voice of the redoubted Christopher North will be heard no more. Thus is one most remarkable man deducted from the lists of living genius, perhaps leaving no more remarkable successor. Wilson has been lost to us at sixty-nine. There was something arresting in the man, both physically and intellectually. A fine figure approaching six feet, a handsome countenance full of eloquent expression, vivid muscular movements, told, as he swept through the streets of Edinburgh, fully as much upon the eyes of men, as his brilliant articles in *Blackwood's Magazine* told upon their understandings and their feelings. He was one of those poets to whom the ordinary mechanism of poetry is only a bondage, and who do not bring their full force to bear till, breaking these fetters, they launch into the realms of prose. The floods of comic humour and lofty eloquence which he poured through the *Noctes Ambrosianæ* of twenty years ago, gave him his strongest hold upon

the public. At the same time his geniality of nature endeared him immensely in the circles of private life. He was continually surrounded by a staff of young literary aspirants, who made him something very like an idol. He was only unfortunate in his political demonstrations, none of which have been approved by time. No one, however, doubted his good faith, and his assistance in latter years to the cause of popular instruction fully expiated all earlier mistakes.

The people of Edinburgh have resolved to do him the honour of a public statue, and a subscription for that purpose is meeting with extensive support.

#### THE STUDIO.

We had, a few days ago, the pleasure of witnessing, in the great hall in the Euston Square terminus of the London and North-western Railway, the inauguration of the statue of George Stephenson, the real Railway King, the originator of the locomotive, the thinker-out and worker-out of the whole detail of the railway system, from the grand discovery of the blast-pipe to the invention of the steam-whistle. The work is by Mr E. H. Baily, R.A.; and it exhibits, in a marble statue about eight feet high, a happy medium between the colossal and the idea of a man elevated above the average of humanity. The burly form and nobly intellectual countenance of the great railway hero, has been most successfully represented by Mr Baily, partly from the picture by Lucas, and partly from the sculptor's personal recollections of that great man, who rose from the lowest drudgery of the coal-pit to invent the magnificent principle of the blast-pipe, which, by making steam create speed, makes speed create steam, and *vice versa*; who threw a railway over the Chat Moss—a feat pronounced the triumph of engineering; a man who has designed and executed in all their details 5000 miles of railway, and on whose lines you may travel from London to the border; and through whose hands have passed, and usefully passed, more scores of millions of money than has yet been estimated.

At the competition in Westminster Hall some seven years ago for high-art pictures on a large scale for the decoration of the Westminster Palace, Mr C. Lucy won a prize amongst an enormous number of competitors, for a picture containing nearly twenty figures of the leading men of the Pilgrim Fathers, with their wives and children—at the moment of being addressed by their pastor, Mr Robinson, before setting sail in the *Speedwell* and the *Mayflower*. The faces of the principal personages are portraits; while those of the others whose likeness was not attainable are skillfully turned away, rather adding to than detracting from the general effect. Among the portraits are those of Mr Carver, who was the first governor, but who perished in the dreadful pestilence which swept off more than half of the founders of America. Another of the portraits is that of Mary Chilton, who was the first who stepped upon the then desolate shore, and christened the bay New Plymouth, from the name of the last port the *Mayflower* touched at in England. Mr Lucy's work is a very noble one, and well deserves a place in a national institution. The grouping is marvellous—at once perfectly artistic and perfectly natural, the whole assemblage being slightly divided into three groups, each harmonising with the other, the centre one being somewhat elevated upon a low ledge of rocks. Both the drawing and the colouring are admirable. The left arm and hand of Mr Robinson are remarkable specimens of fore-shortening, and altogether the work does great credit to English art. It has been in the hands of Mr Burnett, the well-known engraver, for a line representation, which we understand is nearly, if not entirely, finished.

Looking in the other day at one of the Messrs Christie and Manson's private views—of a cabinet of

the 'choicest pictures'—we hardly found the general run of the works to equal the description. True, there were many admirable works, chiefly of the Dutch and Flemish school. The gem of the Madonnas was, in our estimation, a sketch or a study for a great work by Murillo. The Virgin and Child are represented amid clouds, with a company of child-angels most artistically grouped around. The holy beauty beaming from the mother's face is managed to be shewn in a wonderfully small space, and the graceful ease of her reclining attitude at once strikes the eye. The two principal Italian works of the Madonna class are a *Mater Dolorosa* by Carlo Dolce, the face of the Dolorosa having no more expression of anguish than that of the most unconcerned personage; the merits of the picture—if they are merits—being the intense vividness and richness of the colouring. The other was a *Virgin in Prayer*, by Domenichino. The Dutch and Flemish pictures, however, form the largest and best part of the collection. We have often wondered that men of such undoubted genius as Teniers and Ostade should continually practise the abominable style of art representing the worst canaille of their country—the ugliest, dirtiest bores they can find out—drinking, gambling, smoking, seated on chairs with three legs, on forms and barrels, in a dark dirty hovel; while a drab of a woman draws the liquor, and bores as ugly and filthy as the others stand around, drink, smoke, and watch the game. Were it not for the consummate painting and extraordinary faithfulness to all minutiae of detail, these pictures would never have endured so long. We prefer the Dutch and Flemish artists who depict the comfortable houses and the comfortable families of the substantial citizens of Ghent, Antwerp, and Liege, amid the elaborately carved furniture and the ancient hangings which the Flemings love—with perhaps a Rubens upon the wall—or the landscape, the river flowing lazily, poplars and willows clustering on its banks; villages, consisting of large one-story houses, built close to the river, with the willows before; and Dutch galiots, with drooping sails, waiting for the wind or the tide. Or again: sea-pieces, under sun and shade, calm and storm; the galiots equally at their ease in either—for these flat-bottomed craft, content to carry little sail, ride like ducks over the waves, are kept from drifting to leeward by what are called lee-boards, and are seldom or never wrecked.

All Londoners, and very many who are not Londoners, have observed in passing along Piccadilly, close to the Burlington Arcade, a huge black wall, like that of a prison or a fortress. Within that hold long walled the Earl of Burlington, in a gloomy seclusion—the huge gates only swinging open to admit or let forth his lordship, or his few aristocratic friends; but when passers-by stole a glance, they saw a great dreary court, and behind as great and dreary a façade, with, if our memory does not fail, a terrace and a magnificent sweep of stairs. Behind, it was known that there was a voluptuous garden, with all manner of decorations, ornamented walks, and statues, and fountains, and conservatories, and what not. Well, all this secluded magnificence is to be flung open to the public, for the purposes of art and science. The government have given £140,000 for it; and as soon as the ultimate purpose or purposes have been decided on, and the design and plans arranged, it is to be presumed that the structure will be immediately put in hand. The artists are loud for a national gallery, with a better management and more pictures—the savans, for a hall of science; but within the space occupied by mansion and garden, there may be presumed to be ample room for both. At any rate, there will be time for consideration; and doubtless the opinions both of artists and scientific men will be duly taken.

It is gratifying to see springing up all around us, particularly in the suburbs, churches built and decorated in a very different style of architecture from that of the last generation, when an Erecthaum, in the shape of the St Pancras Church, was built—every detail of the Grecian architecture being carefully copied—and then disgraced for ever by a clumsy belfry, no part whatever of the original building, but supported by iron pillars. There really ought to be an act of parliament for taking down this deformity. At present, however, the taste is in favour of churches. Early English churches, three roofed compartments below, forming nave and aisles, a square tower, more or less decorated with Norman windows, and a spire, generally of delicately tapering lightness. The rules of architecture are not always preserved in these buildings. To give them more variety, Saxon arches are adopted in the principal entrance, when the arched Norman succeeds it in the windows, and the lancet in the higher regions. Some of the best of these are the Camden Square Church, a beautiful specimen of a tower; Miss Burdett Coutts's Church, built for a poor population in an obscure part of Lambeth, and also celebrated for its tower; a new church near the entrance to Camden Town, on the mixed principle; a gem by Pugin, on the Hampstead Road, of pure Saxon; and the most beautiful of all, the queen of the London spires—St Margaret's, in Margaret Square. This spire is very curiously designed. Flat slopes gradually widening extend from the top, blending into each other in the most remarkable fashion, and upon strict mathematical principles; so that, upon walking round it, it seems somewhat as if you were contemplating a mathematically cut prism or crystal. The church belongs to the extreme section of the Puseyites, and is being decorated by Mr Dyce. Every detail, both in the outside and inside of the body of the church, is purely monkish in its character, and the same character is carried to the tops of the squares. One other church, and we have done. It has been begun on pure Norman principles, and carried on up to about ten feet of the square tower, where a pointed leaden roof has been stuck on, and all further progress stopped. The structure belongs to the body of Latter-day Saints, over which Mr Henry Drummond, M.P. for West Surrey, is the 'Ruling Angel.'

## GOSSIP ABOUT SEAMEN.

BY A NAVAL OFFICER.

No men, in my opinion, are less selfish than our seamen, or more true to their word. When I commanded the *Riflemen*, we generally refitted at Malta, and were ready for sea before we obtained pratique; so that when the yellow flag came down, I used to give two or three days' leave to every one who wished to go on shore. There were always a sufficient number willing to remain to take care of the brig. We once came out of the quarantine harbour on a Saturday, when, on hearing from the senior officer that our services would not be required for a week, I permitted every one who chose to go on shore. The following morning, important dispatches arrived, and there was no vessel to take them on to the admiral but the *Riflemen*. The senior officer sent for me, and said: 'I know your men are all on leave for two days—when do you think you could get them together?'

'This night,' I replied; 'but I should not like to sail till the morning.' He expressed surprise at my thinking I could assemble the people so quickly.

'If you could but do it!' said he; 'but is it possible?'

'My men, sir,' I replied, 'have never yet failed me. They know that I never ask for exertion or self-denial but when the good of the service requires it.' I went on board, told the truth to the men who were not

—about eighty seamen and marines—and get them on board by sunset. At eight in the evening, all but six had returned, and these sent me the following laconic message:—'Tell the captain he knows he can depend on our word. We will be on board in the morning before the brig is out of the harbour.' They came on board, just as we were ready to go out.

When I was first-lieutenant of the *Queen Charlotte*, on our voyage to Algiers, we had on board six or seven smugglers, a class I have always found to be fine stout men, and good sailors. In those days, smugglers were sentenced, as a punishment, to serve a certain number of years in the navy, and the orders were to put them in irons every night when the ship was at anchor. I proposed, however, to Sir James Brisbane to put these men on their honour, and to treat them like the others. He did so, and promised that if they behaved well, he would endeavour to procure a remission of their sentence; and this, in fact, was the result, for their conduct was so good, that the remainder of their sentence was remitted on the return of the *Queen Charlotte* to Portsmouth.

During this same voyage, two London thieves were discovered in the ship, with all their implements, dark-lanterns, skeleton-keys, &c. They were put into irons previous to their being punished, and so continued, until the bombardment of Algiers commenced, when some good-natured person released them, and the rogues ran to their guns, and fought like honest men. After the general thanksgiving for the success of our enterprise, there was a general muster on the quarter-deck, the officers on one side, and the ship's company on the other, with the two thieves between them. Lord Exmouth addressed the crew in the following words:—'These two London thieves I proposed to try by a court-martial, and they were therefore put into irons: it was not my intention to permit them to fight along with honest men. I will not inquire how they got out of their irons, and reached their guns. They did so; and now you, my lads, shall decide their fate. I will try them by a court-martial, as I purposed, or send them to India in the *Minden*, just as you decide.'

'Don't disgrace us, sir!' was the prompt and general reply; 'send them to India'—and to India they went in the *Minden*, ticketed as they deserved.

When the action at Algiers was over, the best artist could not have done justice to the scene we were leaving behind us. The nine Algerine ships and the store-houses were still such a mass of flame, that the Mole, and the part of the town nearest to it, were as light as the most splendidly illuminated ball-room; while over the dark-green hills, behind and above the town, a heavy thunder-storm was advancing, the forked lightning rendering the darkness beyond awful. The storm burst upon us just as we had anchored, about nine o'clock, and had gone to our supper of bread and cheese.

At this time, as R—s passed the entering port, towards the place where his cabin had been, he saw a young seaman walking to and fro; and after he had passed, it struck him that the young man had lost an arm. He turned back, and said: 'How is it with you, my lad?' and found that the wounded man belonged to the *Hebrus*, and had been wounded in one of her boats close to the *Queen Charlotte*, into whose cockpit he had been taken; that his arm had been there amputated; and that, at the close of the action, all her wounded being placed in cots or beds, he, unwilling to give further trouble, had come to the entering port, and was watching in the hope that some boat might pass, in which he might be taken to his own ship. R—s saw him safe in bed before he himself lay down.

When I was first-lieutenant of the *Rhin*, and busy stowing the sheet-anchor, three times I made a very fine young man, working at my side like a Hercules, with-

I turned to give directions for a pull of the forestay, he replaced it on the same spot, and the anchor at the same moment slipped, and crushed it. We released it before the blood flowed, and as I stooped down instantly to bind it, he arrested my arm, saying: 'O Mr —, you will spoil your silk handkerchief!'

Some years before this, in one of our boat-expeditions, I climbed over some rocks to cut the cable of the ship we were trying to take, and falling headlong into the sea, out of sight of my party, was supposed to be killed. When I recovered, and regained the rocks, I found—although the boat had pulled off, to secure our half-won prize—that two of our men had remained behind, under a fire of musketry, 'to bring off,' as they told me, 'my body.'

I will give you an instance of the faith I have in the word of a sailor. The *Rhin* was fitting out in Hamoaze, during the war, at a time when men were most wanted, and the press was heaviest. A noble-looking young man, a perfect and able seaman, was pressed out of a transport-ship, in which he was second-mate, and sent to us from the flag-ship with the strictest injunctions to guard him, lest he should escape. I saw that he was heart-broken, and placing him in the gunner's crew, begged the gunner, a good man, to try to cheer him. The next day, his mother, sister, and a lad came on board to see him. They remained on the main-deck with him all the time the people were at dinner, and when the work recommenced, he came to me on the quarter-deck and said: 'Sir, I know you cannot grant what I ask, but to please my mother and sister, I come to say, that they wish you to allow me to go on shore with them. I would be off again by daylight to-morrow morning.' I started.

'Did you not hear,' I asked, 'the strict orders I received yesterday, to guard you well?'

'Yes, sir; I knew you could not grant their request,' and sorrowfully he returned to them. The young lad, an assistant in the post-office, was standing by, and as Honeyman left me, he said:

'If, sir, you would let me remain as his surety, I would gladly stay.' I looked at him, and replied:

'Why, half a dozen such as you would not equal his value to us.' He also left me; and as I walked away from the wretched party, my good genius whispered: 'Try him!'

I turned back, and called Honeyman to me. 'I am going to put my commission into your hands,' said I. 'You said you would return by daylight to-morrow. If I let you go on shore, give me your word that you will be off at eight o'clock in the morning.'

'I will, sir.'

'Then go.' He made but one bound to the gangway-ladder, another into the waist, without touching one step of it, and spoke but a single word to his mother and sister as he passed them. Both of them lifted up their clasped hands. I could not stay to see more—and will only add, that Sam Honeyman was a first-class petty-officer of my favourite old ship, when, nine months after this time, I left her, to join Lord Exmouth in the *Boyne*.

#### THE TRANSITION FROM ANIMALS TO PLANTS.

It has been long asserted by Bory de St Vincent and others, that there exist in nature organised bodies, which are animal at one period of their lives, and vegetable at another! This, if true, would for ever put an end to the possibility of distinguishing the two kingdoms when they shall each have arrived at their lowest forms. Its truth has, however, been denied. On the contrary, Kützing, in his recent magnificent work on *Alga*, insists that it happens in his *Ulothrix zonata*. He asserts that in the cells of that plant there are found minute animalcules with a red eye-point and a transparent mouth-place; that they are not, in fact, distinguishable from Ehrenberg's *Microgena monadina*; these bodies, however, are animals only for a time; at least, they grow into vegetable threads, the lowest joint

of which still exhibits the red eye-point. This phenomenon, which Kützing assures us he has ascertained beyond all possibility of doubt, puts an end to the question of whether animals and plants can be distinguished at the limits of their two kingdoms, and sufficiently accounts for the conflicting opinions that naturalists entertain as to the nature of many of the simpler forms of organisation.—*Jameston's Journal*.

#### A. MATIN-SONG.

BY JAMES FAYN.

BARE the head to the windy morn;  
Suffer the rout of locks unshorn;  
Into thine eyes let dew be blown,  
From clover-field and fairy down;  
Into thine ears the summer leaf  
Her secret tell, that clasps no grief,  
Her life hath been so blithe and brief.

Listen to that the laverock sings,  
Poising high on her unseen wings;  
For at the golden gates she is  
Of heaven, and all its harmonies;  
And she sings us the self-same song,  
Fresh from lips of the angel throng.

Before the dull world wakes below,  
Set thy feet to the mountain's brow,  
To the height of the star-set throne  
Whereon the red morn sits alone;  
Slake thy glance on the fields and farms  
Folded round in the river's arms,  
Or corpse, or down, or simplest sight  
God hath given for man's delight;  
Steep thy thought till thine eyes grow dim,  
And thought and tear shall be prayers to Him.

#### DAVIES'S PATENT PEDOMOTIVE CARRIAGE.

This carriage consists of a single wheel of 6 feet 6 inches diameter, with a seat and winch attached to the centre on either side. The wheel, of 7 feet diameter, covers 21 feet at each revolution, and the weight of the whole averages from 80 to 90 pounds. A great merit in the invention is the small amount of friction, and the mode of suspending the weights. The weight is thrown a little in front of the axle. From various trials, it has been shown that two persons can travel with ease at the rate of sixteen miles an hour; and that so little are the legs called into play—the body being quite at ease, and supported by a padded cushion in front—that the fatigue of working the carriage sixteen miles is not so great as that of walking four miles. In wheeling round, the person on the inner side throws his whole weight on, which raises the outer rider off his legs, and the wheel comes round instantaneously. The inventor and others feel assured that thirty miles an hour might be accomplished without any great effort. The invention is altogether a great improvement on the original velocipede.—*Year-book of Facts*, 1864.

#### NOTICE.

A press of descriptive matter of interest belonging to the passing day, has necessitated the omission, in this Number, of *Things as they are in America*. The succeeding portion of the work, describing some things as they are in New York, will appear next week.

CHAMBERS'S REPOSITORY OF INSTRUCTIVE and AMUSING TRACTS.—This Illustrated Work resembles in some respects the MISCELLANY of TRACTS published a few years ago, aiming at a higher, though not less popular tone, and will, no doubt, it is hoped, the new requirements of the day in regard to literary elegance—the papers being original compositions, prepared expressly for the work by popular and practised writers. A Number appears every week, a Part every month, and a Volume every two months. Ten volumes (1s. each) have now appeared.

Printed and Published by W. and R. CHAMBERS, 3 Bride's Passage, Fleet Street, LONDON, and 339 High Street, EDINBURGH. Also sold by J. M'GLASHAN, 50 Upper Sackville Street, DUBLIN, and all Booksellers.

## THINGS AS THEY ARE IN AMERICA.

NEW YORK.

At length in New York—a city I had long wished to see, and to which the eyes of all Europe are directed as the actual metropolis of the New World. Arriving in this important emporium by railway, the city was taken at a certain disadvantage; for a true impression of the real character of its position can be obtained only when it is reached by sea. It is a very curious thing that nobody till he sees it, can properly understand the situation of New York. Accounts of it are not clear. Our minds are perplexed by two opposite circumstances. The city is said to be on an island—the island of Manhattan—and yet is connected with the mainland. I now got rid of this mystification.

Coming by railway down the left bank of the Hudson, which is seen to expand into a fine broad estuary, with the picturesque elevations of New Jersey on the opposite shore, the train ran directly into the town; having crossed a narrow strait, which, according to topographers, makes the promontory on which New York is situated an island. As if, however, there was no end to the confusion of ideas on the subject, the Hudson, which is, in reality, on the west of the promontory, is locally spoken of as North River; a narrow arm of the sea which separates New York from Long Island is called East River; and the strait, little better than an artificial canal, which stretches from North River to East River, is named Harlem River. The island of Manhattan, so formed by this environment of water, is about thirteen miles in length, by at most two in breadth, and terminates at its southern extremity in a narrow and level slip of ground, known as the Battery. From this defensible point the city has crept gradually northwards, covering the whole island in its progress, and is already from three to four miles long, with plans of extension that will finally carry it to the limits of the island, and, it may be, far beyond.

Reaching the city by a back-way, as it may be called, we have the opportunity of seeing the worst side first—straggling half-built streets, with shabby stores, lumber-yards, heaps of rubbish, petty wooden houses, and a general aspect of disorder. At an assigned point the train stopped, and I imagined we had reached the principal terminus. No such thing. The delay was only to detach the locomotive, and to take the train piecemeal into town by horses. And so, drawn by a team of four horses at a trot, the car in which I was seated went smartly up one street and down another—the rails being laid in the causeway—till we reached the heart of the busy metropolis. Attaining the place of disembarkation at last, a scene

of indescribable confusion ensued, and I began to experience the effects of those imperfect police arrangements for which New York unfortunately suffers in general estimation. No cabs of the ordinary kind, but hackney-carriages with two horses, presented themselves for hire; and the drivers seemed to be at liberty to do what they liked. After engaging one of them, the driver thrust another person in upon me, though bound for a different hotel; and I had considerable difficulty in at length inducing another driver to take me solus to my destination—the Astor House. I may say once for all, that on other occasions I had the same annoyance with the New York hackney-coachmen, who appear to stand at the lowest point in the scale of a class admitted to be troublesome in every community.

Months previously, I had heard of the difficulty of procuring accommodation in any hotel in New York, and had adopted the precaution of bespeaking a room at the Astor, through a friend in the city. With nothing, therefore, to fear on this score, I was fortunate in at once finding myself settled in one of the largest and best-conducted hotels, and at liberty to study the working of a class of establishments which transcend anything of the kind in England, and are about the chief wonder in a country celebrated for the gigantic scale of its operations.

At the first look, we see that New York very much resembles the more densely-built parts of London. The houses, tall, and principally of brick, are crowded into narrow streets, such as are seen in the neighbourhood of Cheapside, with the single difference, that many of the buildings are occupied in floors by different branches of business, with a profusion of large sign-boards in front. For the most part, the houses have sunk floors, accessible by a flight of steps from the foot-pavement; and these cellar-dwellings are very commonly used for some kind of small business, or as 'oyster saloons,' or 'retreats'—the names considerably employed to signify taverns and grogeries. Wherever any of these older brick edifices have been removed, their place has been supplied by tenements built of brown sandstone; and it may be said that at present New York is in process of being renewed by this species of structure, which is elegant in appearance, but, I fear, less substantial in many respects than a regard for security warrants. The more narrow thoroughfares are at the same time widened and paved according to modern taste. The more ancient, though much changed part of the city in which the throng of business chiefly prevails, is confined to the southern division, stretching from the Battery a mile northwards; and within this quarter the breadth occupied from the North to the East river is seemingly about the same as that from the

Thames to Holborn—a limited space, which necessitates the continual pressure northwards, as well as an escape to the opposite shores of the two bounding waters.

Though limited as to breadth, no site could have been more happily selected for a great commercial city. The peninsula, if it may be so called, rises just as much towards the middle as admits of easy drainage, and in front and on both sides is environed with tidal waters, which present accommodation for any quantity of shipping. Through the centre of the city lengthwise runs Broadway—the Fleet Street and Strand of New York—and going down any of the cross-streets on either hand from this leading channel of intercourse, we soon come to a quay, presenting a line of houses on one side of a busy thoroughfare, and a crowd of steam-boats and shipping on the other. The city, therefore, so far as it can be, is surrounded by maritime traffic. Nor could any situation be better chosen for defence. Approachable from the Atlantic by vessels of the largest burden, its prospect towards the ocean is intercepted by a semi-circle of islands, which, fortified and commanding the beautiful bay which fronts the city on the south, give a certain degree of security to the position.

Hampered as to space, New York has no room for villas; and in this respect there is a marked difference between it and our English cities. Those among the more affluent orders who dislike living in streets, require to proceed by ferry-steamers across either of the two bounding waters, and on the opposite shores find spots for ruralising. The narrowest ferry is that across East River to Brooklyn and Williamsburg, on Long Island, now becoming thickly settled with a population more or less connected with New York. The wider ferries on the North River communicate with the state of New Jersey, which is pleasantly fringed with towns and villas; the two most prominent places being Jersey city and Hoboken. The vessels employed on these ferries are doubtless the finest of their class in the world. They resemble floating-platforms, sufficiently large to accommodate several carriages in the middle part, and are provided with well-warmed rooms for foot-passengers at the sides. They respectively pass to and fro every five or ten minutes, and as the charge to Brooklyn is only a cent, and that to New Jersey but three cents, they command an immense traffic. Still further to relieve the pressure of population in New York, steamers are constantly plying to and from Staten Island, which is situated about five miles distant, at the mouth of the bay; and the scattered villas along the sloping shores of this fine island are more like what one sees in England, or on the banks of the Clyde, than anything else in America. The channel between Staten Island and the southern extremity of Long Island, is called the Narrows, through which vessels inward-bound proceed from the Atlantic, and so reach the spacious landlocked bay, with its magnificent harbourage.

With so favourable a situation for external traffic, and reposing on a river which is navigable for 150 miles, New York has attracted to itself a population of about 600,000, and is the port of disembarkation for nearly 800,000 immigrants annually from every country in Europe. Forming a central point for American and European commerce, a vast trade pours through this city, and is thence radiated by river, canal, and railway to the great West. In the amount of tonnage of vessels, exports and imports, transactions in floating capital,

wealth, social importance, and munificence of institutions, New York keeps considerably ahead in the United States; and the traveller who has in remembrance its rise from small beginnings so late as the seventeenth century, will not fail to be struck with its present proportions.

The principal object of curiosity in or about New York, is the Croton Aqueduct, which few strangers miss seeing. The works connected with this great undertaking are on a scale which reminds us of the stupendous aqueducts of the ancient Romans. Bringing water from a distance of forty miles, and requiring in their course a lofty bridge across Harlem River, the works cost 14,000,000 dollars, or near upon £5,000,000 sterling—an immense sum to raise from public rates to supply a city with water. The discharge of water is stated at 60,000,000 of gallons per diem; and even this large quantity is not more than is required. Having visited this marvel in engineering, little remains to attract curiosity. Interest is centered in Broadway, and mainly towards its southern extremity. Hereabouts are the handsomest public buildings, the finest stores, some of the largest hotels, and the greatest throng of passengers. At about half a mile from the Battery, we have on the line of Broadway an opening called the Park, which though only a railled-in patch of ground, with a few trees and foot-paths through it, is a very acceptable breathing spot in the midst of everlasting bustle.

Some traveller speaks of the buildings of Broadway as being a mixture of poor wooden structures and splendid edifices. There may be a few houses of an antiquated class, but any such general description is totally inadmissible in the present day. We see for the greater part of its length, a series of high and handsome buildings, of brown sandstone or brick, with several of white marble and granite. Some of the stores and hotels astonish by their size and grandeur. Rising to a height of five or six stories, with a frontage of 150 to 200 feet, and built in an ornamental style of architecture, these edifices are more like the palaces of kings than places for the transaction of business. New York, it seems, is celebrated for its extensive dealings in 'dry goods,' the common phrase for all kinds of clothing and haberdashery; and its shops or stores for the retail of these articles are of most extraordinary dimensions. Stewart's Store, a huge building of white marble, adjoining the Park, on Broadway, is pointed out as the largest of these concerns; and the amount of business done in it is stated to be above 7,000,000 of dollars per annum. It is useless, however, in a place of such rapid change and improvement, to point out any edifice as excelling another. In various parts of Broadway and Bowery, large and elegant buildings are springing into existence at a cost perfectly startling; and so great is the rise in the value of property and the increasing expense of conducting business, that I should fear things are going a little too far for the ultimate benefit of the city, at least as regards manufacturing industry. One of the latest opened of the new and gorgeously fine structures, is Taylor's Restaurant—an establishment, some will think, much too fine for the uses to which it is put. Another of the new buildings is that occupied by Appleton & Co., publishers; its extent and grandeur contrasting curiously with the dingy holes and corners in which the publishers of London carry on their business. The activity displayed in resolving upon and completing

any scheme of improvement in this great city, pervades every branch of affairs. In conducting business, there is no pause, and, as circumstances shew, sometimes too much hurry. There is, however, in every department of commerce, a stimulus to action, arising from the vast demands of a country growing so rapidly in population and wealth. An instance of this came under my notice at the great fire which consumed the printing and publishing establishment of the Messrs Harpers. Perceiving that the whole of the steam-presses were consumed, and no means left for carrying on operations on the spot, a party connected with the firm, and while the fire was still burning, sent off by electric-telegraph to engage all the available presses of Buffalo and Cincinnati! In New York, so valuable is time, and so speedily are decisions come to, that on the very next day after a fire, we may observe builders engaged in the work of reconstruction. American minutes would seem almost to be worth English days!

Without a court, and not even the seat of the state legislature, New York cannot be said to be the place of residence of a leisurely or a numerous literary class. Its more opulent inhabitants, connected some way or other with business, form, nevertheless, an aristocracy with refined tastes, and ample means for their gratification. Advancing northwards from the more busy parts of the town, the elegance and regularity of the houses become more conspicuous, and at last we find ourselves in the quietude and splendour of a Belgravia. Here the edifices are entirely of brown sandstone, and of a richly decorated style of street architecture; all the windows are of plate-glass; and the door-handles, plates, and bell-pulls silvered, so as to impart a chaste and light effect. The furnishings and interior ornaments of these dwellings, particularly those in Fifth Avenue, are of a superb kind; no expense being apparently spared as regards either comfort or elegance. In one mansion where I experienced the most kindly hospitality, the spacious entrance-hall was laid with tasseled marble pavement; the stair and balustrades were of dark walnut-wood; one of the apartments was panelled in the old baronial fashion; and in a magnificent dining-room, the marble chimney-piece, with exquisitely carved figures illustrative of Burns's *Highland Mary*, cost, as I understood, as much as 1500 dollars. The influx of German and French artists to New York, was alluded to as affording means for effecting everything desirable in decorative art, and of excluding the necessity for importing English ornaments. Perhaps it is worth while to add, that New York is not destitute of the means for supplying coats-of-arms to those who desire such decorations for their carriages, seals, and other articles. There is, indeed, no heralds' college here or elsewhere in the States; but I observed in Broadway an establishment where coats-of-arms are furnished as a matter of business; and in the shelves of the principal booksellers, works on the British peerage and baronetage are about as common as they are in England.

Passing over any notice of the churches of New York—some of them with handsome spires, and generally picturesque in effect—and also the banks, theatres, and other public structures, the edifices most worthy of attention are the hotels. It has been incidentally stated, that the hotel-system of the United States is of a peculiar character. I found that it had crossed the frontier into Canada; but in no part of that province had it attained full-blown maturity. Properly speaking, the American hotels are boarding-houses, and consist of two distinct departments—one for ladies and families,

welcome to come, stay, or go, as suits their pleasure; the charge being specific at so much per day, whether the guests attend meals or not, by which means every one knows to a fraction beforehand how much he will have to pay. We could hardly picture to ourselves a greater contrast than that between an old country and an American hotel. The two things are not in the least alike. Arriving at an inn in England, you are treated with immense deference, allowed the seclusion of a private apartment, charged exorbitantly for everything, and, at departure, curtsied and bowed out at the door, as if a prodigious favour had been conferred on the establishment. In the United States, things are managed differently. The Americans, with some faults of character, possess the singular merit of not being exclusive, extortionate, or subservient. But where all travel, hotel-keepers can afford to act magnanimously. Instead of looking to a livelihood from a few customers, scheming petty gains by running up a bill for the use of candles, firing, and other conveniences, and smoothing everything over by a mercenary bow, the proprietor of an American hotel is a capitalist at the head of a great concern, and would despise doing anything shabby; hundreds pour into and out of his house daily; he notices neither your coming nor going; without ceremony you are free of the establishment; and when you pay and depart, there are no bows, no thanks—but you are not fleeced; and that is always felt to be a comfort.

In recollection, I am at this moment arriving at the Astor House, one of the most respectable hotels in New York, though outdone in dimensions and decoration by some of the newer establishments. Before me is a huge building of whitish granite, with a front on Broadway of 200 feet, a height of six stories, and forming altogether an independent block, with rows of windows on every side. The ground-floor consists entirely of retail-stores of various kinds, and ascending by a central flight of steps, we reach a spacious lobby with marble flooring and pillars. This lobby is strewn about with luggage newly arrived, or about to be carried out; young men are lounging about on chairs; some persons are walking to and fro; several house-porters are seated on a form waiting for orders; long corridors are extended right and left; opposite the entrance is an access to the bar and other conveniences; and near a window behind is a counter and desk where the whole book-keeping is conducted by a clerk or general supervisor of the concern. Walking up to this functionary, we inscribe our name in a book; without speaking a word, he marks a number opposite the name, takes down a key with a corresponding number in brass attached to it, issues an order to a porter, and we and our baggage march off along one of the corridors and up several stairs till we reach the assigned apartment.

Here, on looking round, everything is neat and commodious; and on the back of the door is seen a printed statement of particulars requisite to be known—the times of meals, the charge per diem, and so forth. The number of apartments in the house is 326; a portion of them being bedrooms of a better class for families and ladies, and the others of the small kind appropriated to single gentlemen. These classes are distinct in every respect. Descending to the level of the entrance-hall, we search out an eating-saloon, and parlours devoted principally to the single male guests, and in the opposite corridor is observed a suite of public apartments used by ladies and married people, yet not shut against casual visitors. There is, in truth, little privacy. The whole house swarms like a hive. The outer swing-door bangs backwards and forwards incessantly; and the rapid thronging of guests and visitors in and out, can be fancied when I mention that, on several occasions, I counted as many as twenty persons entering and the like number departing per minute. Recalling in certain details the former

continental hotels, there is, generally speaking, nothing at all to compare with this in Europe.

Among the novel parts of the system are the arrangements in the family and lady department. Here, we find ourselves in a kind of elysium of princely drawing-rooms and boudoirs, in which velvet, lace, satin, gilding, rich carpets and mirrors, contribute to form a scene of indescribable luxury. What strikes us as rather remarkable, is the fact that the doors of these various sitting-apartments are generally wide open. I saw this everywhere. Passing by, you see highly-dressed ladies reposing on satin couches, or lolling in rocking-chairs. One, who has just come in, and still has on her bonnet and shawl, is rattling over the keys of a piano. Another is reading a novel. Several are outside in the corridor, seated on velvet-covered ottomans, talking to each other or to the gentlemen belonging to their party. These corridors are every whit as legantly furnished as the rooms, and are jocularly spoken of as 'the flirtation-galleries,' on account of their qualities as places of general resort and conversation. Another recommendable quality they possess, is their comparative coolness. The drawing-rooms, leading from them, are kept so hot by staring red fires of anthracite coal, that I am at a loss to understand how the temperature can be endured.

What between dressing, lounging about the suit of rawing-rooms and flirtation-galleries, and attending to meals in the saloons, the lady-guests of these hotels have little time for miscellaneous occupation. Some of them appear in a different dress at every meal, and, in point of elegance and costliness of attire, they went beyond anything in my poor experience, except at full-evening-parties and balls. In the more moderate class of hotels, this attention to costume is less conspicuous, and the ladies unceremoniously take their seats at the top of the table common to all the guests. In such houses, however, as the Astor, families and ladies usually take their meals in a saloon by themselves; and when there are children, they likewise have their own special table-d'hôte. The mention of children in such establishments is not suggestive of pleasing recollections. Everywhere, these youngsters are a sore trial of temper to the guests generally. Flying up and down the passages with whoops, yelling, crying, and umbling about in everybody's way, they are clearly out of place, and constitute an unhappy and out-of-situation in American hotel-life.

It need not be supposed, because families and children are seen to be domesticated in hotels, that this kind of housekeeping is carried to any great length. Young persons, for a few years after being married, and families in town for the winter, are the principal inmates of the class; though it must be admitted that their circumstances give a bias towards this method of living. Probably something is due to that choice of lands cooked in first-rate style, which could not be obtained in a separate establishment unless at a very high cost. The French cuisine predominates, and the refusal of dishes mentioned in the bills of fare put before guests, is such as cannot fail to astonish those who in England are fain to dine off a single joint. The entire charge for board and lodging, service included, at the Astor House, was two dollars and a half, equal to 10s. English, per diem, for a single individual. This is a common charge at the best hotels; in a few instances the charge being as high as three, and sometimes as low as one or two dollars.

Breakfast from eight to ten, dinner at three, and tea at seven, was the routine at the table-d'hôte of the Astor; on each occasion, about 200 guests sitting down at three long and well-served tables. Here, again, though looking for it day after day, did I fail, as on previous occasions, to see the slightest approach to hurried eating; and as until the last moment of my stay in America I never saw such a thing, I am bound, so

far as my observation goes, to say that the national reproach on this score, if it ever was true, is so no longer. Calling for dishes, by printed bills of fare, a custom now all but universal, in reality renders any scramble unnecessary. So far from being hurried, any man may draw out his dinner for an hour, if he pleases, and all the time have a waiter in attendance at his back to bring him whatsoever he desires. I think it due to the Americans to make this remark on a very common-place topic; and likewise to say of them, that their temperance at table filled me with no little surprise. In the large dining-parties at the Astor (as at other houses), there were seldom seen more than one or two bottles of wine. Nor did any exciting beverage seem desirable. A goblet of pure water, with ice, was placed for the use of every guest; and in indulging in this simple potion, I felt how little is done in England to promote habits of sobriety by furnishing water, attractive alike for its brilliant purity and coolness.

Dropping off from table, a number of the guests adjourn to the parlours, where they read newspapers bought from boys who frequent the doorway and passages, or they lounge idly on the sofas, or take to writing at the tables (never much talking, and the doors always wide open); some go out in pursuit of business; some, who like to sit in the midst of a fluctuating crowd, betake themselves to the chairs in the lobby; and some descend to the bar. This latter place of resort is a large and finely decorated apartment, lighted from the roof, and occupying the entire central court round which the house is built. In the middle is a *jet d'eau* and basin; at one side is a marble counter, with an attendant in charge of a few bottles behind him on a shelf, whence he supplies glasses of liquor to those calling for them, and which are paid for on the spot. A number of chairs are scattered about. Two fireplaces, with blazing billets of wood, throw a cheerful heat around. A young man at a small enclosure is selling cigars; and on two long stands are placed files of newspapers from all the principal cities in the Union. Much is said by travellers of the drinking in the bars; but in this, as in most things, there is some strange exaggeration. The bar of the Astor, an exchange in its way, was sometimes tolerably crowded, but I seldom saw so many as a dozen at a time engaged in drinking. The greater number did not drink at all; it being one of the good points in these establishments, that you are left to do exactly as you like. No one heeds you, or cares for you, any more than in a public street. A unit in the mass, your duty is to mind yourself; seek out all requisite information for yourself, and in all things beyond the routine of the house, help yourself. Individuality in these hotels is out of the question—opposed to the fundamental principle of the concern, which is to keep open house on a wholesale plan. You are lodged, fed, and in every other way attended to by wholesale; just as a soldier in a barrack is supplied with houseroom and rations. Any man pretending to ask for a dinner in a room by himself would be looked upon as a kind of lunatic; and when people do such a foolish thing, they have to pay handsomely for invading the sacred practice of the house. How otherwise could such gigantic establishments be conducted! Although crowded to the door, everything goes on with minute regularity, like a finely adjusted machine.

Left to himself, the stranger soon drops into the ranks, and strolling about, discovers a number of little conveniences ready to his hand. Let us just look round the lobby of the Astor, beginning with the left-hand side. There, at a wicket in the wall, like an open window, stands a man to take your hat and upper coat, and put them away in a bin till you want them. Looking into the place, you see it surrounded with receptacles for articles, which it would be inconvenient to carry about the house, or hazardous to lay down carelessly; for we are admonished by placards to beware

of 'hotel thieves'—a hint not to be lightly disregarded. Adjoining in a niche in the lobby, is a man with brush in hand ready to clean and burnish your soiled boots. A little further on is a light closet, with basins of water and towels, to save you the trouble of mounting to your bedroom before going in to dinner. Further round in the lobby, is a recess with a desk, pens, ink, and paper, furnishing means at all times to write a hurried note. A few steps beyond, and passing the flight of steps which lead to the bar, we come upon an enclosure like a sentry-box, in which is seated a clerk with the machinery of an electric-telegraph; and on handing him a slip through his wicket, he will, for a trifling sum, despatch a message for you to almost any city throughout the United States. I made use of this gentleman's wires on two occasions, in sending to distant towns, and had answers handed to me in a neat envelope within an hour.

We now pass the waiter's form, and study the apparatus of the general book-keeper, which occupies the right side of the lobby. Behind the counter of this officer, we perceive a large case of pigeon-holes, with a number over each, and appropriated for receiving letters or cards left for the guests. Knowing your particular number, you have only to glance at the little depository under it, to know if any one has been calling, or if any letters have arrived for you. At one end of the counter, there is a letter-box into which you drop all letters for post, which is another means of saving trouble. But the most curious thing of all, is the arrangement by which the official behind the counter knows who signals from his apartment. To have some hundreds of bells would produce inextricable confusion. All the wires in the house centre at one bell, placed in a case in the lobby, with the whole mechanism exposed on one side within a sheet of plate-glass. The other side of this case is covered all over with numbers in rows. Adjoining each number is a small crescent-shaped piece of brass, which drops from the horizontal, and hangs by one end, when the wire connected with it is pulled, the bell being by the same action sounded. The attention of the book-keeper being so attracted, he directs a waiter to proceed to the apartment indicated, and with his finger restoring the bit of brass to its former posture, it is ready for a fresh signal. A more neat and simple arrangement could not well be imagined. The fronts of these bell-cases are of white enamel, and being set in a gilt frame, have a pleasing ornamental effect.

So much for the Astor, to which there are now many rivals of equal or larger dimensions—the Irving House, the Prescott House, and numerous others, including the two more recently established and peculiarly splendid establishments—the Metropolitan and St Nicholas, both situated considerably 'up town' in Broadway. The Metropolitan, an edifice of brown sandstone, with a frontage of 300 feet, is superbly furnished, and laid out with 100 suites of family apartments, and can accommodate altogether 600 guests, whose wants are ministered to by 250 servants. The cost of building and furnishing this prodigiously large house, is said to have been 1,000,000 dollars. The St Nicholas, I believe, aspires to stand at the head of its order. It is a splendid structure of white marble, containing 150 suites of family apartments, and with accommodation for nearly 800 guests; I understood, indeed, that preparations were making for the accommodation of at least 1000 people. The cost of this establishment has been spoken of as 1,030,000 dollars; but doubtless this is below the mark.

Some not less interesting features of these great hotels remain to be noticed. They generally print their own bills of fare, which are freshly executed with the date, daily. Their suites of hot and cold baths, their billiard-rooms, and their barbers' shops, are on a most commodious scale. The Americans appear to be

particularly punctilious as regards their hair and beard, and a frequent visit to the perquier seems an indispensable part of their personal economy. All English gentlemen in the present day—those who rely on the service of valets excepted—shave their own beard, for which purpose they take portable dressing-cases along with them on their journeys. I never could understand why the not overindulgent Americans, lodging in the great hotels, or travelling by river steam-boats, require to be shaved by professional tonsors. At all events, there, in the barber's apartment, in every hotel, are seen seated a number of gentlemen—under the hands of coloured operators. And in what luxurious attitudes!—leaning back in a couch-like chair, and the feet exalted on a velvet-covered rest, we have a picture of ease and lassitude which I should fancy is only to be matched in the dressing-rooms of nobles and princes.

Perhaps it may be expected that I should say a word on that subject of everlasting condolence—servants. I was agreeably disappointed to find that the Americans are not so badly off for domestic assistance as they are usually represented to be. A great change for the better in this respect has lately occurred, through the influx of Irish. It is wonderful to notice how soon an Irishman in a long-tailed ragged coat and patched knee corduroys, is transformed into a hotel garçon, dressed neatly in a white jacket and pants, combed, brushed, and rendered as amenable to discipline as if under the orders of a drill-sergeant. Thus smartened up, the Irish have become a most important people in the United States. Irish girls, who would fail to find an open door in London, are here received with a sigh of delight; and what American housewives and hotel-keepers would now do without them, is painful to reflect upon. It being apparently a fixed maxim in the mind of every white man and woman in the States, that domestic service is intolerable, the inpouring of Irish has solved an immense difficulty. Numerous, and spread over a wide region, this useful people have already dispossessed in a great degree the coloured race, who, consequently pushed into humbler situations, suffer, it may be presumed, an aggravation of their sufficiently unhappy lot. I found corps of coloured waiters chiefly in Canada. At only one place (Congress Hall Hotel, Albany) did I see them in any of the northern states. Whether white or coloured, the waiters in every hotel, when attending table, are marshalled into the saloon, each carrying a plated dish in his hand, the procession reminding one of the theatrical march in *Aladin*; and in the setting down, and uncovering these dishes, and walking off with the lids—the whole corps moving off in line—they obey a fugleman with that military precision, which among a people less imperturbable than the Americans, could scarcely fail to excite a certain degree of merriment.

The laundry departments of the American hotels ought not to be forgotten in the list of marvels. Placed under the management of a special clerk, who records all necessary details, the arrangements for washing, drying, and ironing would astonish any ordinary laundress. The drying is done by rapidly-whirling machines, which wring out the wet, and cause the articles to pass through currents of hot air, so as to turn them out ready for the ironer in the space of a few minutes. Depending on these aids, the American needs not to encumber himself with great loads of underclothing in his excursions. Anywhere, in an hour or two, he can get everything washed and dressed, as if he had just started from home. Arrangements for his comfort do not stop here. In New York, and generally in other large cities, the hotels, for the most part, have a range of shops or stores on the ground-floor, fronting the street, adapted to supply the wants of travellers. Articles of clothing, gloves, jewellery, umbrellas, canes, note-paper, perfumery, medicines, and so on, are found in these shops, which in one

place (Washington) I found were connected with the hotel by a back-entrance from the main corridor. An American hotel is not a house: it is a town.

W. C.

## WEARYFOOT COMMON.

### CHAPTER XXII.

IN WHICH THE DENOUEMENT COMES AT LAST.

It was the most genial of spring mornings when a stage-coach stopped at the Plough to set down a passenger; and the moment it stopped—perhaps a trifle before—Robert Oaklands bounded from the vehicle, and was received in the arms of the captain and Elizabeth. But even in the midst of their greetings the thoughts of the traveller went astray. How could it be otherwise? The Common lay stretched before him, that common on which he had wandered when a boy, a weary, hungry, friendless, homeless vagrant, lost in the mist that overhung the world, lost only to be found by his happy fortune! A kind of awe passed across the mind of the young man as he gazed, accompanied by a strange, vague feeling of incredulity; and it was with some difficulty he comprehended what was said to him by the captain, as they took their way along the well-known track.

'Don't be in a hurry, Bob,' said the veteran; 'walk slowly, for I have something to say; and that is why we came to meet you, for I would rather have stood at the door, to see you leap across the road into my arms, as you did when you were a lad, looking for all the world like a panther in fun. You must know'—

'My dear friend,' interrupted Robert anxiously, 'is there anything amiss? I see Sara's blind is down!'

'Yes, and Sara's eyes too, and Sara's heart lower than all. You must know that she somehow wormed out of me—and it is no easy matter, you are aware, getting into the guard of an old soldier—that I had written for you to come down to take her to task about her avarice, and hard work, and the piano, and the old frocks, and so on, and, by Jove, she had no sooner come to the fact than she was well-nigh at the fainting! No more work since then, no more eating, no more sleeping; nothing but bursts of tears, and flushed and white cheeks time about. And I can tell you, Bob, I kept as broad awake all that night as an outpost in an enemy's country, thinking she was about to play us the trick I caught you at when you were a boy. I felt sure, in fact, that Sara was going to run away! I told you what effect your scolding would have upon her; but I confess I never imagined that the mere thought of it would set her frantic. Now I wanted before you saw her to give you a hint just to draw it as mild as you can—as mild as new milk, Bob. Speak kindly to poor Sara—won't you, old fellow? You know if she is different from the other girls of the Common, it is you who made her so; and you must think of old times, and your school letters, and the dancing, and singing, and poor Molly, and be soft, and gentle, and loving to our Sara—won't you, Bob?' Bob could not speak for a moment.

'Never fear,' said he at last, with a gasp—'never fear! only come along—no use in crawling when I have good news to tell. My highest expectations have become realities; I am rich, my dearest friend—at least independent: we are all rich, all independent, all happy: come along!' He almost upset Molly when she opened the door. He flew into the parlour—it was empty; into the other sitting-room—empty too; he then bounded into the garden, while Molly, better knowing

where her young mistress was to be found, flashed up the stairs.

But Molly had no need to announce the arrival. Ashamed—mortified—crushed—Sara had seen them cross the Common; and she guessed with great accuracy the communication that was made by the captain, and even the good soul's entreaties that Robert would meet her with kindness and encouragement—her, the poor country-girl who was detected in the fact of secretly impoverishing herself to enrich the favoured lover of Miss Falcontower! But the circumstances were so desperate, that at length the pride and courage of Sara's nature were effectually roused. She rose from her seat at the window, where she had sat crushing her hands together—rose far beyond her usual height, shewing 'fearful fair,' as she gathered round her like a mantle all her feminine hauteur and virgin reserve. The interview that could not be avoided she determined to seek; and in descending the stairs to the parlour, slow, tall, and silent, she looked, with her stately step and classical head, like a vestal priestess.

When Robert bounded into the room, and shut the door behind him, it appeared to have been his intention to clasp her in his arms; but if so, he found the atmosphere that surrounded her too dense even to admit of hasty approach. Some elastic body, as viewless as the air, seemed to resist as he drew near. Her sweet but proud and defiant eyes, fixed upon his, overawed him; and when at length he took her offered hand, it was to raise it reverently to his lips.

'Dear Sara,' said he, struggling with his timidity, 'I have so much to say, I do not know how to begin! But devout gratitude'—

'Robert,' interrupted Sara, 'let us understand one another first. I have no design to evade the subject; but neither is it my intention to appropriate more of your gratitude than is my just share. In your early boyhood, my dear uncle incurred a heavy responsibility—a responsibility which has cost him since then many anxious days and sleepless nights. Recently, there appeared to come a crisis in your fortunes, which might be directed for permanent good by the aid of money. It was himself told me this; and in the beautiful simplicity of his nature, he asked my consent, as well as my dear aunt's, to his raising the necessary sum by the sale of this family property—a property to which he was himself attached with a kind of devout affection. Now, could I permit this? Could I see him wander forth from this cherished home in his old age, with his small income burdened with the rent of another? Do you blame the poor orphan, to whom he was father and mother, friends and relations, the whole world in one, for taking the sacrifice upon herself?'—

Robert was transfixed. He grew cold—frozen—torpid; and dropped her hand, as if his fingers had lost the power to hold it.

'I do not blame you,' said he at last, rousing himself; 'the action was only in accordance with the nobleness of your nature; and since you deprive me of gratitude, you cannot prevent the feeling from being replaced by admiration. But did you hope to be able to preserve concealment? Did it not occur to you that your uncle would carry out his own plan, ignorant of that being no longer necessary?'—

'I trusted,' replied Sara, with some confusion of manner, 'in—in—you; and I hope you will not fail me. Lead the conversation to the point; assure him that you are provided with funds—he stands on too much gentlemanly punctilio to press you as to their source; and so the whole thing will by and by be forgotten. As for the little deprivations I submit to, they are not worth talking of.'

'Sara,' said Robert, looking searchingly into her eyes, 'it seems to me impossible that you can think me so base as to permit such a sacrifice! But if your motive was merely to save your uncle from impoverishing

himself for my sake, did you not know that the object might have been attained by the slightest hint to me? Why submit to deprivations that were wholly unnecessary for the point you had in view? Moreover, whence was your agitation, your tears, your terror, when you found yourself on the brink of a discovery so honourable to your pious devotion? O Sara, I will not abandon hope! I will believe that—that'—

'Robert!' cried Sara, starting back in surprise and affright, 'this from you! Tell me,' she added, passionately, 'from whom did you suppose the money came?'

'From Miss Falcontower.'

'And do you, then, presume to—to—to'— But Sara, much to her shame and indignation, was interrupted by the tears that would force their way.

'Lord Luxton,' continued Robert, inhumanly rejoicing in her grief, 'in return for long-continued literary services, had promised me a public appointment of some value; but from this engagement, on discovering the meanness of my origin, he appeared disposed to withdraw. When I found, therefore, that the surprising windfall did not come from my old benefactor, and imagining it to be wholly out of the question that you could have made so terrible a sacrifice for my unworthy self, I did suspect that Miss Falcontower, who, beneath the incrustation of artificial life, has still some original nobleness of character, had taken this mode of making up so far for her father's defalcation. Lord Luxton, however, undeceived me, by mentioning that his daughter was told one evening by the family lawyer in Lincoln's Inn, of the reluctance with which he had just consented to be, in his way of business, a party in dissipating more than half of your little property! Now, Sara'—

'Robert, did you ever love the nobleness of character you talk of?'

'Always—but not the woman. My own Sara!' and he passed his arm round her waist, and drew her unresistingly to his bosom, 'I never loved but you! I am here, not to reject your sacrifice, but to accept it. So far from returning any portion of what you have given, I demand more—all—and you, my life and hope, with it! Speak, Sara, with your own simple, truthful lips—from your own generous, noble, womanly heart—will you make me the happiest and most grateful of men?' Sara was still weeping—but what delicious tears!—still some small, ailing sobs told of the varying emotions she had undergone; and it was with a low and broken voice she answered—

'That you wish it, Robert, is happiness enough for me. The time may be distant, but I shall await it with trust in God, and implicit confidence in you.'

'The time is come—it is now!—and the work I have still to do in the world is no longer for bread, but for usefulness and distinction!'

The tone in which the conversation was pursued may now be imagined. They were seated side by side on a sofa, in the usual attitude of promised lovers, and with Wearyfoot Common in view from the window. Robert disclosed to Sara the whole details of his London life—including even the audacious kiss he had printed on the hand of Claudia, and the story—in which, however, he had been forestalled by Molly—of the spectral face seen at Mrs Margery's window. On these points, and on these alone, Sara asked no questions, and made no remark.

'Tell me,' said she at last, 'if this Heaven-sent fortune had not come, what would have been your decision on discovering the source of my anonymous gift?'

'I am afraid to answer,' replied Robert; 'for I have more than suspected that there is a hard untrusting element in my character, though not, I hope, in my nature, which I must endeavour, with your assistance, to eradicate. Your touching devotion should have shattered my flinty theory to pieces; and I hope—I

am sure—it would have done so, had you been by my side. Without you, I tremble to think how much worse I should have been than I am. You do not know what blessed influences I drew from that faint lone star so often seen above the dreary Common! You do not know what a cold dark world this would have been for me without that light of hope! The mist would never have risen from my soul, the splash of the rain would never have ceased to hiss in my ears. O Sara, think of what I was, if you do not find me all you wish! Think of that miserable boy, for whom no creature cared so much as for a stray dog, even among the unhappy crew who perhaps included her to whom he owed his being! Think of the darkness through which he wandered—of the'—

'Robert—dearest Robert—think rather that the mist is gone, the darkness dispelled, and that your star, as you call her, is shining, with all the little twinkling power she has, full upon your heart! See how green, how fresh, how beautiful is the desert Common, spangled with the small wild-flowers that peep out to greet the coming summer! Look how the sunbeams are shaken in successive showers of spray over its surface; and hark to that sweet, clear, winged voice that rises from its bosom straight up to heaven, interpreting the mute heart of the world!'

'I will, I do, my own best love!' said Robert, hiding his face on her shoulder; 'but when I think of the change, I am choked with a happiness so undeserved.' When he raised his head, the beautiful shoulder was wet, and he would have dried it in some confusion, had not Sara taken his hand gently in hers.

'Nay, beloved,' said she, with her soft, sweet voice, and fixing on him as she spoke her lofty and earnest eyes—'nay, beloved, these are sacred drops! Let them stay, and be absorbed to heaven—let us give them jointly to the God of Mercy, an offering and a vow!'

The day of Robert and Sara's return from the marriage-trip, was a great day in the village of Wearyfoot. The launch of a shay-cart was to take place—that elegant hybrid between a gentleman's gig and a business vehicle—the first that ever was seen in those parts, and one of the handsomest that ever was seen anywhere out of London. The children of both sexes, and various women with babies in their arms, were collected long before the time. With some the door of the chaise-house was the popular point of view, for there they would catch the first glimpse of it as it came forth into its circumambulatory existence; but others, with perhaps better taste, preferred clustering round the baker's shop, where there would be added a human interest to the spectacle. Not a few of the more staid and respectable of the inhabitants, who were quite above testifying any curiosity of the kind, made an errand to that part of the line of street, and lingered to converse with a neighbour about the weather; while, as a general rule, there seemed to be quite a remarkable turn out in the village, the population finding it, somehow, desirable to take a mouthful of the sweet crisp air outside their doors.

The vehicle at last came forth, and was hailed with a shout of small voices. It was a very handsome gig in front for the riders, with a long body behind for the loaves, the whole painted and varnished in green and yellow like a gentleman's carriage; and it was drawn by a horse as fat as was consistent with smartness, and with a coat as brown and sleek as you shall see in any picture of Landseer. It drew up at the shop-door, and presently there came forth the young baker and his newly-married wife. There was some little flutter and awkwardness at first in the lady's getting into so novel a position, but this was ended by the husband, a fine, stout, prompt fellow, almost lifting his spouse into the carriage, and stepping lightly in after her himself.

As Molly—for you know it was our Molly—arrayed in a silk gown, but of modest colour, took her seat for the first time, looking round upon the crowded street, and with the cheers of the boys and girls in her ears, her head swam for a moment; and when the equipage dashed off, she caught her bold young husband's arm, and two or three little nervous sobs—the last weakness of the kind—told her emotion. As they passed down the street, nods, smiles, and good wishes were sent to them from every door, for Molly was a universal favourite. And how could it be otherwise, since she was a kindly, good-tempered, frank, womanly, handsome girl, fit for the future mother of genuine English hearts—of high-spirited, generous men, and true and loving women!

Their destination was the Lodge—Simple Lodge, for by that name it shall rest in our memory—and their object was not only to felicitate and be felicitated, but to shew Master Robert how the vehicle looked he had presented to them as a marriage-gift. They drew up at the kitchen-door, and Molly having first asked leave, piloted her husband to the hall. How they were kindly invited into the parlour, and shaken by the hand; how Molly, in addition, kissed Mrs Oaklands' hands with many smiles and tears; how she wouldn't sit down on any account but at the very edge of the door; how they drank a glass of wine with bows and curtsies, and the best of wishes, and ate a bit of cake out of their own shop; and how, flattered and delighted with their reception, they very soon took their leave and descended again to the kitchen, needs not be told.

But here they encountered another visitor, who had come in when they were up stairs, and Molly, with a loud scream, threw herself upon Mrs Margery. The scream brought instantly down the young couple and Elizabeth, for the captain would hardly have entered these precincts if he had heard a military hurra; and there was not merely a new shaking of hands, but Sara clasped Mrs Margery in her arms, and kissed her with tears in her eyes. Mrs Margery, however, though now a respectable tradeswoman as well as Molly, would not be prevailed upon to go up stairs. She would go home with her old fellow-servant, and stay with her that night. She had merely come down, she said, to see the Denowment she had predicted, and planned, and watched, and waited for so long—to see it with her own eyes. She had seen it, praise be to goodness. She had found it all right—just what it ought to be, and could not help being, and she was satisfied and thankful. As Robert and Sara knew that they would be the greater part of every year in London, and had a great many affectionate plans in their minds about Mrs Margery, they thought little of the abruptness of her present visit; and so, after a little more talk, and an affectionate and respectful leave-taking, she went away, and was driven back into the village in Molly's carriage.

As soon as Robert and his wife saw the visitors out of the kitchen-door—they had already admired the equipage—they rushed up the stairs, chasing one another, and calling and laughing like boy and girl, till they found the captain.

'There is Margery! there is Margery!—to the window, dear uncle!' and the captain obeyed orders in double-quick time. But on this occasion likewise he was too late. He saw only a couple of large shawls to choose from; and the veteran, with a look of almost superstitious puzzlement, turned away from the window, muttering—

'That's very extraordinary! That is ve-ry ex-tra-ord-in-ary!—What do you think of it,' continued he, turning to his sister, 'hey, Elizabeth?'

'All authors agree,' replied the virgin, 'that the disappointments of life serve as teachings to the wise. When an individual desires to observe a comely cook or

clear-starcher, his best mode of procedure, I venture to suggest, is to open the window and look out.'

'That's very true, Elizabeth,' said the captain, 'that's very true, and if I don't do so the next time she comes, may I be shot!'

All sanguine authors—and they who are not sanguine have no business to address themselves to the multitude of their kind—take the flattering unction to their souls, that they have excited an interest in their personages, sufficient to induce the reader to desire to know what becomes of them after the close of the story. It would be difficult for us, however, to satisfy this curiosity, supposing such to exist, because we have brought up the chronicle within so small a number of years of the present moment, that fate has had no time, even if she were assisted by Mrs Margery herself, to arrange their several denouements.

We may say, however, that, thanks to the Weary-foot connection, and his own skill in Grecianizing sun-bonoses, Mr Driftwood's business of cheap portrait-painting flourishes to this day; although we are sorry to add that his rascally boy still continues to be out of the way just at the moment he is wanted. The artist looks confidently to Mr and Mrs Robert Oaklands personally for a periodical addition to the number of sitters, and has not, so far, been disappointed. His friend takes the utmost care of these family portraits. They are always kept in the country, and are never permitted to be out of their cases in the lumber-room, except in compliment to the modern master himself when he comes on a visit. But Driftwood, it is said, has the prospect of a family-gallery of his own. At any rate, Miss Bloomley has taken a great notion of art, and is always bringing him sitters. Now, at her mother's death, the lodging-house in Great Russell Street will be her own; and, besides, she is herself the beau-ideal of a London girl of her rank, a fine, high-spirited, saucy, generous-hearted handsome lass—just the very person to make the good-natured artist happy, and confine his little eccentricities of genius within the line of prudence.

Mr Poring and Mr Slopper, after the fight, resumed gradually their friendly intercourse. The former has not yet attained the mark of his ambition. The difficulty is not as to a house, so much as to a landlady. He could get plenty of both, it is true; but his choice is restricted within the small number of houses where the lower classes is not admitted, and within the still smaller number of landladies who possess the qualifications of Mrs Margery—a crustaceous attachment to home, and a sufficiency of money. He has made proposals to several of the latter kind, but found them, as he declares in confidence to Mr Slopper, vulgar and senseless, and blind to their own interest, beyond belief.

Adolphus, under the management of his excellent mother, has married in his own degree of intellect and station; and if he could only believe it, is much better off than if he had obtained the hand either of Miss Falcontower or Miss Semple. As for his friend Fancourt, he was just about to accept the captain's invitation, and go down to have a run upon Wearyfoot Common, when intelligence reached him of the union of Robert and Sara. This gave the hermit a chill, and indisposed him for running. He sits in his cell for hours moralising on his wasted existence, with a void behind and before him; the latter somewhat relieved by the picturesque prospect of the gout in the midst.

Claudia Falcontower is still young in spite of years, still radiantly lovely in spite of time. She has lost her taste for public business; and for that reason Lord Luxton has retired from the political world, and is distinguished only as a connoisseur in art. Claudia has refused more than one brilliant offer of marriage since her father's succession to the peerage, and it is thought has no intention to change her condition. She is a patroness of literature, and many a struggling author, male and female, has been largely indebted to

her helping-hand; but she makes no intimates even among her protégés, and with her cold and even haughty manner, liberal heart, and exquisitely refined taste, she is a complete enigma even to those whose business is the anatomy of character. She spends the greater part of the year at Luxton Castle, and listens condescendingly to Miss Heavystoke's long stories of her former pupils, and more particularly of her last, with whom that good lady remains in constant epistolary correspondence, and to whose children she expects one day to act as governess.

Claudia likewise pays some attention to her little cousin's education: but she is not attached to children, at least in the ordinary way—they seem to make her melancholy, and she rather shuns their society. Her interest, however, was one day excited in a more than usual manner by a child she had never seen before, and would probably never see again. She was walking in Kensington Gardens, and had gone into one of the alcoves to rest, when a nurse-maid passed by with her charge. The little creature, a fine boy between three and four years of age, took her at first for his mother, and ran in crying joyfully, 'Mamma!' but when she raised her head, and he discovered his mistake, he stopped short, and shaking his brown hair from his fair brow, looked at her with eyes so calm and soft, yet so observant and penetrating, that Claudia's attention was aroused. The boy seemed to be limning her features in his own mind; till at length, with a sudden blaze from her strange eyes, she motioned him to approach. He did so with the firm step and calm self-possessed air befitting a gentleman's child; and, putting back his clustering hair from his brow, she gazed long and intently on his face. Then drawing him to her bosom, she strained him in her arms, and kissed him with such vehemence, that the child broke away and ran to his maid.

In a few minutes Claudia came forth, cold, calm, stately as usual; and her servant, who was talking with the nurse-maid, elevated his gold-headed cane, almost as tall as himself, and followed his mistress.

'Slopper,' said she indifferently, when they had walked on a few paces, 'do you know whose child that is?'

'The child, miss,' replied Mr Slopper, touching his hat with official dignity, 'is the son of Robert Oaklands, Esquire, of Harley Street and Wearyfoot Common.'

THE END OF WEARYFOOT COMMON.\*

### FITTING OUT A MAN-OF-WAR.

ONE does not go to the Highlands to shoot partridges; yet it so happened that on the 6th day of September I found myself some twenty miles north of Inverness, waking up these birds from the turnip-fields, the corn being still uncut; and with the assistance of my companions, I managed to make up a pretty good bag.

Such a confession cannot be made without an apology. Here it is. I had been staying some weeks with kind friends; and what with short excursions to places of interest in Ross and Sutherland, salmon and trout fishing, shooting deer both roe and fallow, to say nothing of wild-duck, with an occasional snipe and wood-cock, the time had passed as pleasantly as rapidly. Yet it so happened that on this particular 6th day of September, there was no chance of a fish rising or of getting near a roe. Grouse there were none. There was nothing particular to do, so we waked up the partridges until it was time for luncheon. Visions of a pleasant close to the day enlivened the walk home.

There had been some talk of music for the evening, and a return-match at four-handed chess. There was a certain sunny corner where a volume of Scott was wonderfully appreciated in the afternoon. Dinner must not be forgotten, with its accompaniments of roe-deer soup, fresh caught fish, game-pie, and venison chops hot from the gridiron, and in one of the kindest, most cheerful, and friendly parties that ever crossed the border. But, alas! the inexorable post anticipated the well-earned luncheon. A letter of ominous official form was put into my hand. The seal was broken, and I read—

'ADMIRALTY, 4th September.

'SIR—My Lords Commissioners of the Admiralty having appointed you ——— of Her Majesty's sloop the *Saucy*, it is their Lordships' direction that you repair immediately to the superintendent of Sheerness Dockyard for your appointment, and that you report to me the day on which you shall have joined the ship. I am, sir, your very humble servant,

W. A. B. HAMILTON.

'P.S.—It is desired that you acknowledge the receipt of this letter.'

This was not the first time that a like sudden stop had been put to favourite plans by the calls of the service. So putting a good face on the matter, and scarcely knowing whether to ask for condolence or congratulation, a few things were hurried into a port-manteau, a biscuit into the pocket, a hasty good-by exchanged, and within an hour from the receipt of my letter, I was waiting at a turnpike two miles off for the northern mail to give me a passage to Inverness. This gave me an opportunity of shaking hands with an old friend, who was hurrying off with his bride to Duprobin as fast as post-horses could carry him; and what with this and the glow produced by a fast drive through the sharp, bracing air, on a bright Highland day, I was quite inclined to look on the light side of things by the time I was seated before a round of beef in the Caledonian Hotel at Inverness.

A visit to Mr McDougall at his Clan Tartan Warehouse enabled me to defy the cold of a night on the Grampians; so in another hour I was again behind four horses for a fourteen hours' drive on the mail to Perth. Skirting the Moor of Culloden, lighted by a bright moon, enlivened by a cheerful fellow-traveller, nothing could have been more pleasant than this drive, had it only been a little warmer. The dark hills looked out majestically in the moonlight, the deep shadows adding immensely to their effect; while, to crown all, about midnight a magnificent aurora borealis lighted up the northern sky, shooting up its gigantic rockets from the horizon. Then came the drive through Blair-Athol and Dunkeld, and nine o'clock saw us at the city of the Fair Maid of Perth. From this to Edinburgh, the route was easy; thence twelve hours by express-train conveyed me to London, and in due time I found myself at that most detestable of all our ports, Sheerness, looking at my future home as she lay near the pier.

The time of fitting out a ship is the most unpleasant part of the commission. One must either live in a hulk, and go backwards and forwards in boats several times a day, or take up quarters in some dirty inn ashore, until the ship is made habitable. What I wish to tell, however, is what the fitting out of a ship of war is, and I flatter myself the information, taken as a whole, will be new to most readers.

\* After a short interval, there will appear a new work of fiction by another pen, to be continued, like the above, in weekly chapters till completed.

It generally surprises any one who sees a ship of war at anchor in one of our harbours, when he is told that 1000, 500, or 150 persons, according to the size of the ship, live on board her. A corvette, with a crew of 150 men, does not appear, and really is not, larger than an ordinary merchant-ship of 500 or 600 tons, yet all these persons are boarded and lodged comfortably in their floating-home. But this is not all. The ship must carry a quantity of stores and provisions, which, if they were laid out on the shore, would fill a good-sized barn, and which any one would be apt to bet heavy odds could not be put on board the little ship. In the first place, water and provisions for the whole crew must be carried for some months, to make the ship efficient. In our case, we carried a complete supply for five months: we had fifty-three tons of water, and the weight of the tanks containing this water was eleven tons. Then the weight of beef and pork, biscuit, peas, and flour, sugar, tea, and cocoa, with other provisions, amounted to nearly twenty-five tons, the casks containing them weighing two tons and a quarter. In addition to this government supply of food and drink, the captain and officers take about seven tons of private stores for their own particular nourishment. Four tons of coal and wood; two tons of clothing, soap, candles, tobacco, &c.; two hundredweights of medical stores; and a ton and a half of rum; with more than a ton of holy-stones and sand for cleaning the decks, would fill a moderate-sized warehouse. Then when we consider the weight the good ship has to carry, we must calculate upon twenty tons of ballast, and upon sixteen or seventeen tons as the weight of the men and boys, with their clothing and bedding. The bowsprit, masts, yards, and booms weigh more than twenty-four tons; the rigging, twenty tons; and there are more than four tons of blocks only, or what are better known to landmen as pulleys. The sails weigh two tons and a half, and there is the same weight of spare sails. There are sixteen tons of iron cable, and three tons of hempen cable. Four anchors weigh together more than seven tons; the boats more than three tons and a half. Then come the eighteen guns, which weigh together twenty-seven tons; and the stores taken by the gunners for working their guns, amount to about four tons and a half. The stores taken by the boatswain and carpenter to keep the ship and her rigging in working-order, weigh more than seventeen tons. Lastly, we have three tons and a half of powder, two tons and a half of case-shot, nineteen tons of cannon-balls, two tons of shells, and two tons of musket-balls and small-arms. If all this be added together, the reader will at once see that when our little vessel floated out of Sheerness Harbour to the Nore, she carried with her more than 300 tons of valuable property.

But as a friend of ours exclaimed when we were endeavouring to impress this upon him: 'Where, in the name of all that is wonderful, can it all be put? How can you live amid such a heap of incongruous matter? Where do you all live? Where is the kitchen? Where do you sleep, and where do all the men sleep?'—These are all very natural questions, and it will require some little time to answer them.

To commence with the space 'under hatches,' as it is called, or beneath the floor of the deck on which men and officers live. Any one who knows the shape of a ship, will see, on a little reflection, that this space will be broad and deep in the centre, gradually becoming narrower and more shallow towards both head and stern. At the extreme after-end, there was a space for the captain's stores; and beneath his cabin, the bread-room, capable of holding 100 bags of biscuit, each weighing a hundredweight. Then advancing forward, and beneath two of the officers' cabins, is the slop-room, where all the cloth and duck, shoes, flannel, hats, and other articles for men's clothing, are kept. Parallel

with this, and beneath the gun-room, extending also some way into the centre of the bread-room, is the shell-room and magazine. Each of the shells is packed in a separate box, and treated with such care that no one felt uneasy, although sitting every day at meals with 110 of them only separated from his feet by a plank, with nearly three tons of powder in the magazine close by. In a space corresponding to the slop-room, on the opposite side, was the officers' store-room for provisions. Further forward, in the centre, are the lockers for shot, holding 1260 of these gentle persuaders of thirty-two pounds of cold iron. On either side of them, and of the shell-room, are holds for provisions and spirits. The nineteen tons of iron ballast are arranged just above the keel and round the lowest parts of the inside of the ship. Immediately upon these are the iron water-tanks, corresponding in shape to that of the vessel; those in the centre fixing square; those towards the sides circling at different angles. Six of the largest of these tanks hold each 600 gallons; two smaller ones, each 400 gallons; two of 200; twelve of 875; and eighteen of 110: making together forty tanks, holding 11,280 gallons, or more than fifty tons. These tanks occupy the central part of the ship, except a space reserved for the chain-cable and a small store of provisions for daily use. Further forward is a hold for the beef and pork, with another for coal and firing. Beyond this is the sail-room, where all the spare sails are kept; and, lastly, quite in the bows, the store-rooms, as they are called, but really a sort of dark cupboard, where the boatswain and carpenter keep their stores. All this is under hatches—that is to say, a hatch must be raised to get into any of these spaces. A hatch is a square piece of the floor or deck cut out, so that it can be lifted by a rig, and furnished with locks, and so made as to keep all the lower part of the ship water-tight, or nearly so.

Next comes the inhabited portion of the ship. Commencing as before, from the after-part, we had first two cabins for the captain, each extending the whole breadth of the ship. The after one was small; but with a couple of arm-chairs and a portable fireplace, was a perfect little snuggerly for him in winter, to lounge with a book or play a game at chess with one of us. The fore-cabin was much longer. At one side, doors opened into a sleeping-cabin and a large cupboard, where the charts and chronometers are kept. At the other, was an open sofa-bed place and a cabin where the steward kept all the glass, crockery, &c., for the table. The open space of the cabin was some seven paces by six, and between six and seven feet in height, being lighted by a sky-light on deck. In the centre, was a large square table, where many a jolly party of eight or ten have sat down to as good a dinner as was ever given afloat. Some well-filled book-shelves, a writing-desk, and a few chairs, with a barometer and compass, completed the furniture.

Next came the gun-room, where the gun-room officers—namely, two lieutenants, master, surgeon, purser, and assistant-surgeon—mess. This is also a square cabin, lighted by a sky-light, six paces by five, of the same height as the captain's cabin, furnished simply with a square table, a few chairs, lockers for wine, which are converted into a sort of sofa by a cushion, and drawers and glass-stands for the furniture of the table. At one side, are two cabins for the two lieutenants; at the other side, are doors opening into a narrow passage, which leads from the captain's cabin, past the gun-room, on to the lower-deck, and separates the gun-room from the cabins of the master, surgeon, purser, and assistant-surgeon; which correspond with those of the lieutenants on the opposite side of the ship, but are carried further forward. All these cabins are about six feet square. There is a bed-place with drawers beneath it, a washhand-stand, a flap which can be raised to form a table, book-shelves, a chair, and a

chest of drawers; and this completes the home of each officer. Yet it is surprising how much is stowed away in so small a space, and how much taste is often displayed in setting off one's own particular corner of the ship to the best advantage. Pictures and looking-glasses, Turkish rugs and Greek lace, velvet and gilding, are all brought into play; yet room is still found for clothes and books, the cumbersome cases of uniform, gun-cases, telescope, sextant, and the curiosities picked up at different ports, to prove our remembrance of old friends when arriving again in England.

The midshipmen's berth is on the same side as the lieutenants' cabins, just abaft the main-hatchway. It is merely a cabin some five paces square, nearly filled by a table, over which swings a lamp, and is lighted, like all the officers' cabins, by what are called bulls-eyes—prisms of glass let in through the deck. Around the table are square lockers, and on the top of these the middies sit. Of course there is no room for chairs. Some shelves above receive the sextants, glasses, desks, and books; a recess is fitted up for crockery, and the berth is complete. In this we had two mates, five midshipmen, a clerk, and a master's assistant. None of these officers sleep in cabins, but are slung at night in hammocks like the men, in a part of the lower-deck, just outside their berth, where each has his chest arranged. In this chest he must keep the whole of his dress and property, and a drawer for his washing utensils.

The lower-deck, or the space where the seamen live, cook, eat, and sleep, was 54 feet long, 6 feet 6 inches in height between the beams, and 28 feet in breadth at the broadest part. In this space, 130 seamen had to find accommodation; not only for themselves, but for the galley or kitchen, and for all the mess-tables and stools—to live by day when not on deck, and to sleep by night. It was as well supplied with light and air as is any ship of the class, but still susceptible of improvement in these respects. Along each side a number of mess-tables are arranged, each capable of accommodating a dozen men, six on each side, seated on a stool of the length of the table. Shelves arranged on the sides of the ship receive the plates and 'mess-gear,' as the cookery of the men is called. There is a good deal of pride in the show the men can make in this way, and a little rivalry between different messes. All along the beams are rows of hooks, fourteen inches apart, to which the hammocks are slung at night for the men to sleep in. The hammock is simply an oblong piece of canvas, with holes at each end, through which lines are passed, brought together, and the hammock thus hung to the hooks. It contains a hair mattress and pillow, and a blanket or two for the men, the officers adding the luxury of sheets. In the morning, every hammock is rolled up, tied into a fixed size and shape, and arranged around the bulwarks of the ship, being uncovered in fine weather, but protected, when necessary, by a covering of tarpaulin. Thus there is no sign of a sleeping-place on the lower-deck during the day, all the hammocks being above.

The galley or kitchen would sadly puzzle a shore-cook. No fire is to be seen; no joints are seen roasting. All is enclosed in a square iron case; there is a furnace below, surrounded by water, and into this sauce-pans of all shapes and sizes are let in—from the caldron which boils the soup for the whole ship's company, to the sauce-boat for the officers' fish—all boiling, baking, roasting so called, stewing, for the meals of the captain, the two officers' messes, and the whole of the men, are thus done in an iron box some five feet square, and in many ships distilled water is prepared at the same time. In some of our large troop-ships, 800 gallons of distilled water are thus prepared every day.

Such was our craft below. On deck we had eighteen 32-pounders; and aloft, the usual sails of a three-

masted, square-rigged vessel. This was our FITTING OUT. We were now ready for sea; and, with the usual complement of officers and men, we sailed where our duty called us.

### NEGLECTED TREASURES.

ALTHOUGH ourselves intensely English, we are constrained by conscience to admit, that the people of the continent of Europe do—like the 'Dougai creature'—display certain 'glimmerings' of sense. We have, indeed, been sorely tempted to entertain the idea, that if any enemy were to institute an invidious comparison between the insulars and the continentals, the verdict of an impartial judge—though, of course, on the whole greatly in favour of the superiority of the former—might possibly, on one or two points, incline to that of the latter. To be serious—it does seem strange that, whilst men of other nations should know both where to get the materials for a savoury dish, and how to cook them, the English are so blissfully ignorant on such points, that, although their woods and meadows teem with a rich abundance of wholesome, savoury, and nutritious food—from the gathering of which no law withholds their hands—they allow these treasures to perish before their eyes, and go back to their cottages to a half-meal of unattractive fare. Nay, more than this—if one skilled in such lore were to lay on the cotter's table enough of this good food to supply him and his household for a week, such is the extent of his prejudice, that, in all probability, he would throw the whole of the gift on the dung-heap, and not even suffer his pig to make its supper from it.

We speak of the Fungus tribe. Many of our readers may not be aware that, amongst almost all the continental nations, funguses afford not a mere flavouring for a delicate dish, or a pleasant sauce or pickle, but the staple food of thousands of the people; indeed, in some places, they are for several months in the year not only the staple, but the sole food of tens of thousands of the inhabitants.

Dr Badham—whose most interesting work on the *Esculent Funguses of England* we would recommend to every reader—tells us: 'In France, Germany, and Italy, funguses not only constitute for weeks together the sole diet of thousands, but the residue—either fresh, dried, or variously preserved in oil, vinegar, or brine—is sold by the poor, and forms a valuable source of income to many who have no other produce to bring into the market.' In the markets of Rome, thousands of basketfuls are sold during the season; and so extensive is the traffic in this commodity, that there is a regularly appointed officer for examining the fungi offered for sale. This officer is called *Ispettore dei Funghi*: he is a botanist, competent to pronounce whether the specimens produced are noxious or otherwise; and if he discovers in the lots submitted to him that there are any either stale or of injurious quality, he sends them under guard to be thrown into the river. Those that are pronounced saleable are then weighed, in order that a tax may be levied on them. Quantities under ten pounds in weight are not taxed.

In other Italian states, the number of fungi brought to market is equal in proportion to those sold in Rome. In Hungary, the demand is perhaps greater than elsewhere. In France, there is a strong feeling in favour of mushrooms grown in a garden or otherwise artificially cultivated, over those which spring up indigenously. We believe we are correct in stating, that the British are the only Europeans who do not extensively use these varied and valuable articles of diet. Only hear the list of good things which we neglect! Dr Badham says: 'I have indeed grieved when I reflected on the straitened condition of the lower orders this year, to see pounds innumerable of extempore beef-steaks growing on our oaks, in the

shape of *Fistulina hepatica*; *Agaricus fusipes* to pickle, in clusters under them; puff-balls, which some of our friends have not inaptly compared to sweetbread from the rich delicacy of their unassisted flavour; *Hydnum* as good as oysters, which they sometimes resemble in taste; *Agaricus deliciosus*, reminding us of tender lamb kidneys; the beautiful yellow *Chanterelle*, that *ne plus ultra* of diet growing by the bushel, and no basket but our own to pick up a few specimens in our way; the sweet, nutty flavoured *Boletus*, in vain calling himself *edulis*, where there was none to believe him; the dainty *orella*; the *Agaricus heterophyllus*, which tastes like the craw-fish when grilled; the *A. ruber* and *A. vivescens*, to cook in any way, and equally good in all—these were among the most conspicuous. Besides the above named, we hear of one species which tastes like veal; and there are very many which, like the mushroom, make most excellent ketchup and sauces.

It seems to us a pity that men who have time to spare, nay, who absolutely lack a pursuit wherewith they might fill up some hours of unoccupied time, do not set diligently to work, and fit themselves to act as *Ispettori dei Funghi*, and pronounce on the character of the specimens which may be submitted to their judgment. It would be a pursuit attended with much interest, and of much utility; pleasant in progress, and important in its end, if it enabled them to bring the rich supply of food which this tribe would afford within the reach of the population of our land; for as matters at present stand, although this yearly supply of vegetable wealth is in one sense within the reach of the poor, in another it cannot properly be said to be so; as one unlearned, who did not know the marks by which the edible species might be distinguished from the injurious, would be unwise to venture on making a meal from any individuals of a tribe among which so many species of deleterious, and some even of deadly qualities may be found.

With a view to leading to inquiry on this subject, we shall briefly state a few particulars with regard to the division and arrangement of the principal genera which rank under this order.

Fungi are divided into four sub-orders, each of which is subdivided into series, tribes, genera, sub-genera, and species. So many divisions are necessary to enable us to distinguish the varieties which this most extensive order of plants supplies. But it is not under each of these heads that we find edible species. They are confined to the two primary divisions, *Hymenomycetes*, and *Gasteromycetes*; but chiefly to a tribe or two of the former, only two genera being found of the second class which furnish any esculent fungi, and these are *Bovista* and *Lycoperdon*, or, as they are commonly called, puff-balls.

By far the largest number of edible species are found in the first tribe of the first sub-order, which is called *Pileati*, and contains all which are formed with a fleshy cap. There are six genera thus constituted which furnish fungi fit for the table; but *Agaricus* is that to which we are most indebted. The distinctive mark of this genus is, that beneath the fleshy cap lie laminated plates called gills, placed at right angles with the stem. Some of this genus are large, others small; in some the cap is flat, and in others cone-shaped, or otherwise; but all possess a cap, a stem, and gills—the stem sometimes being in the centre of the cap, as in our common meadow mushroom, and at others, eccentric.

We must now give a few particulars concerning the appearance, qualities, and modes of artificial culture of some amongst the various species of these different genera; and if we should in our way supply a choice recipe or two for cooking these treasures of the wood and wild, we hope it will but make our paper the more acceptable.

And first, as regards the sub-order *Pileati*. We have said that it furnishes six genera in which edible fungi are

to be found. These are—1. *Agaricus*; 2. *Cantharellus*; 3. *Polyporus*; 4. *Boletus*; 5. *Fistulina*; 6. *Hydnum*. The second tribe, *Clavati*, furnishes us with but one genus, *Clavaria*, in which edible species exist; but in this one all the species are good to eat. The third tribe of the *Pileati mirvati* supplies us with those dainty articles of food, morels, as well as with the genus *Helvella*, in which are two excellent kinds much resembling them. The fourth tribe, *Cupulati*, gives us but one genus, *Peziza*, in which is but one esculent species. These are all belonging to the first division, *Hymenomycetes*; of those which are comprised in the second, *Gasteromycetes*, we have before spoken.

From *Agaricus*, however, as we have said, comes our chief crop. Under this head we find mushrooms of great beauty and variety, both in form and colouring: some are white, tinged with violet, brown, yellow, pink, or some other delicate tint; others pure white: some are brown, and some nearly black. In texture, they vary as much as in size, form, or hue; some being as fragile as to yield to the touch of a finger, whilst others are so tough and firm as to withstand a strong attack. The *A. procerus*, or shaggy *Agaricus*, is very large; its cap, which is very fleshy, is campanulate, and covered with a velvety red-brown skin, with a pinkish silky edge. This species may be commonly found in gardens, hedge-banks, and pasture-grounds in the autumn, springing up in solitary state. It is called *Fungo parasola*, from the form of its cap, and its being elevated on a high stalk, which latter characteristic has given it also the title of *Fous de la gambe lunga*. Paulet says of this kind: 'Elle est d'une saveur très agréable, et d'une chair tendre, très délicate et très bonne à manger.' The ketchup from this is said to be superior to that of our favourite *A. campestris*, which is a species too well known to need our notice.

Then, besides these we have named, there are several species concerned in the necromantic work of making those magic circles in the grass which were conceived in days of yore to mark the spot where the fairies had danced.

On drops of dewy grass,  
So nimbly we do pass;  
The young and tender stalk  
Ne'er bends when we do walk;  
Yet in the morning may be seen  
Where we the night before have been.

One of these fairy followers is *A. prunulus*, called by the French *Meuceron*, a large buff fungus of a pleasant flavour, and smelling like fresh meat. Another is *A. oreades*, especially honoured by the title of Fairy-ring *Agaric*—a tough little sprite, of a pretty cream colour, and not exceeding an inch in the diameter of its *pileus*, or cap. This is the *Champignon*, a most delicious mushroom, but looked on with much suspicion in England, on account of a strong resemblance it bears to one or two members of its family of ill repute—indeed, suspected to be of murderous propensities. *A. Georgii*, St George's Mushroom, is another of fairy-ring celebrity. This is called White Caps, and a stout fellow he is, and worthy of being named after the great champion of England—at least if size is to be considered, for one is on record of 5 pounds 6 ounces in weight, and measuring 43 inches in circumference, and another of 14 pounds in weight: it is called in France *Boule de Neige*. This huge fungus is not only found forming part of fairy-rings, but also near haystacks and buildings, as well as in woods. Our common mushroom is a denizen of these rings, as is also *A. orella*, a most delicate and elegant little plant, of purest white throughout, its irregularly lobed cap with smooth undulating edges, and its stem often eccentric. The skin which covers the cap is in dry weather as soft and smooth to the touch as kid. According to Vilitadini, this is 'senza dubbio uno di migliori funghi indigini.'

*A. personatus*, a very pretty fungus, called in England blewits, by which name it is sold in Covent Garden Market, is the last on our list of ring-making fungi. Its cap is from 2 to 6 inches broad, of pale brown, or sometimes violet-tinted, with which colour the gills and bulbous-rooted stems are also tinged. It is said to have a flavour of veal, and should be dressed 'en papillotes with savoury herbs, and the usual condiments, and the more highly seasoned the better.' But although we here close our list of fairy-ring agencies, there are in this genus many more of the edible species which we have no room to enumerate.

The elegant genus *Cantharellus*—distinguished from the agarics by having veins in the place of gills—provides us with but one edible species. This *C. cibarius* is found clustering on the ground in pine and other woods, associated with puff-balls, *Boletus edulis*, and other good things, but exceeding them all in beauty. It is in all its parts of a delicate apricot colour, of which fruit it is said to have also the odour. The chanterelle is its elegant common name; and it may be found from June to October growing in circles, or segments of a circle. At first, it assumes the shape of a minute cone; next, in consequence of the rolling in of the margin as it unfolds, it becomes first hemispherical, finally depressed and irregular, its stem being usually eccentric. This fungus may be stewed or minced, either by itself or with meat; but the common people in Italy either dry or pickle it, or else keep it in oil for winter use. This is one of the few species occasionally used in England. Badham reports: 'No fungus is more popular than the above, though their merits, nay, the very existence of such a fungus at home, is confined to the freemasons, who keep the secret! Having collected a quantity at Tunbridge Wells this summer, and given them to the cook at the Calverley Hotel to dress, I learned from the waiter that they were not novelties to him; that, in fact, he had been in the habit of dressing them for years on state occasions at the Freemason's Tavern.' The chanterelle is as abundant as it is elegant, growing among moss under forest-trees, or starting up from the accumulations of decaying 'needles' in pine-woods with equal freedom.

Of the genus *Polyporus*—so named from the multitude of pores which constitute its reproductive organs—England produces but one esculent species: this is *P. frondosus*, the 'leafy polyporus,' and this one not very commonly. It is found on the roots of oaks in October, and grows to an immense size, sometimes attaining a weight of 80 pounds or more. Berkeley states that 'Clusius had seen in Hungary masses 3 feet high. Woodward found a mass 2 feet broad, and the tiled lobes near the tree more than 6 inches deep.'

But though England produces but one polyporus which our botanists represent as edible, Italy supplies the deficiency; for there and in other parts of the continent several of our rejected species are eagerly sought out and eaten; and, moreover, there are some valuable species which our land does not furnish: amongst others, *P. tuberaster* and *P. corylinus*, both of which, from the singularity of their mode of culture, deserve notice. The former 'springs from the *Pietra fungifera*—a compact argillaceous tufa, in which its spores are imbedded. It is produced by watering a block, and keeping it at a sufficiently high temperature—that is, from 65 to 75 degrees Fahrenheit—when a crop of mushrooms will come up in about six weeks, and continue to be produced at intervals of about three months.' The other species, *P. corylinus*, grows on the trunk of the cob-nut tree. 'It is excellent for food—so excellent, as seldom to find its way into the Roman markets, being generally disposed of, like other choice funguses, in presents.' To grow this artificially, you are to cut a block from the tree towards the root, fire it over a little lighted straw till singed, then water it

and put it by in a cave or cellar, when the whole stump will shortly become covered with funguses, which are reproduced in several successive crops. The stumps suitable for producing these fungi are sold in the Roman market at 6s. or 7s. each.

The genus *Boletus* supplies two valuable species—*B. edulis* and *B. scaber*, both of which grow under oaks or in woods in summer and autumn. Berkeley says of the former: 'Though neglected in this country, it appears to be a most valuable article of food. It resembles very much in taste the common mushroom, and is quite as delicate.' He tells us that it may be cultivated by merely watering the ground under oak-trees with water in which a considerable quantity of these fungi have been allowed to ferment; but adds, that it is necessary to fence round the ground, on account of the extreme love which pigs and deer have for them.

*Fistulina hepatica*—so called from a supposed resemblance which the adult plants bear to the liver—is a treasure indeed, though, alas! too much neglected. Springing from the wood of oaks, elms, willows, and other trees, it at first appears of a rich vermilion tint, which deepens with age. It sometimes attains an enormous size, having been found of thirty poundweights. In flavour, it is said, when grilled, closely to resemble broiled meat with pickle, for there is an acid taste in the flesh which makes it meat and sauce in one.

The genus *Hydnum* supplies an esculent which, 'when well stewed,' says Badham, 'is an excellent dish, with a slight flavour of oysters. It makes also a very good *purée*.'

We must not close this slight account of the esculent fungi of England without a word about that valuable species the truffle (*Tuber cibarium*), which ranks under this division. Truffles are found under the surface of the ground in various parts of Europe, as well as in India and Japan. In England and Scotland, they are chiefly found in beech-woods. They are rough irregular nodules, from one to two or more inches in diameter, the surface cracked into warts. 'Truffles,' says Berkeley, 'are much sought for as a luxury, and are hunted by dogs trained for the purpose, or by swine.' Rees von Essenbach records an instance of a poor cripple boy who could detect truffles with a certainty superior even to that of the best dogs, and so earned a livelihood. Truffles are brought to table either simply boiled, or stewed in various forms.

We would now, in conclusion, ask the candid reader, whether, if all this be true—which we assure him, to the best of our knowledge and belief, it is—we assume too much in saying, that, in the fungus tribe, England possesses a treasure which she too much neglects? and whether those who wish well to the community at large, would not do wisely to enable themselves to pronounce on the character of those fungi which abound throughout the country—that they who are free enough from prejudice to be willing to avail themselves of the abundant yearly supply of food which it has pleased God graciously to bestow, may not be deterred by the impossibility which at present exists of deciding whether that which is offered to them is nourishing food or deadly poison?

We have said but little of the wonderful mode of development of this tribe, the manner in which a living and nutritious mass springs from the decaying trunk of a dead tree, the hard tufa-rock, or the dried and exhausted animal excretions which have lain for months under the influence of drenching rains and scorching sunbeams. The workings of the Creator are indeed to us unfathomable. Few things among the works of creation are more mysterious than the manner in which fungus-life is made to permeate all nature. 'Nothing perishes in nature,' says Dr Badham; '*destructio unius matrix alterius*: life may change titles, but never becomes extinct: so soon as the more perfect

plant dies, a host of other vegetable existences, hitherto enthralled by laws of an organisation superior to their own, now that the connection has been severed, put forth their separate energies, and severally assert their independence: the poplar may have perished, root, stem, and branch, but its extinction is only the signal for other existences, which had been heretofore bound up and hid within its own, to assert themselves; and accordingly a polyporus sprouts out here, here a *Thelephora embellishes* the dead bark, and here an agaric springs out of the decaying fibres of its head; these in turn also decay; but as they languish away, they moulder into a new kind of fungus-life, of an inferior type to the last, as if their own vitality were inferior in kind to that of the decayed poplar whence they lately issued.'

#### LOST ON DARTMOOR.

Few roam the heath e'en when the sun,  
The golden sun, is high;  
And the leaping laughing streams are bright,  
And the lark is in the sky.

But when upon the ancient hills  
Descends the giant cloud,  
And the lightning leaps from tor to tor,  
And the thunder-peal is loud:

Heaven aid that hapless traveller, then,  
Who o'er the wild may stray,  
For bitter is the moorland storm,  
And man is far away!

CARRINGTON.

We often hear of the 'green lanes of Devonshire;' and truly those to whom they are familiar, who have threaded their windings, and plucked the beautiful flowers and waving ferns that grow so luxuriantly in their hedges, will not be inclined to depreciate their loveliness. Mention is more rarely made of the wilds of Dartmoor, albeit the poet Carrington has sweetly sung their many charms, and woven into spirit-stirring verse the time-honoured legends that give an additional touch of romance to many a rugged tor and quaking bog. For the lover of the picturesque, for the true worshipper of nature, who delights to escape from the din of cities and the crush of crowds, to roam where mortal foot hath rarely been, or climb the trackless mountain with the wild flock, free as the pure breath of heaven that plays around its base, and kisses its crested top—those eloquent solitudes will ever have numberless attractions; whilst to the chafed spirit, and the heart over which deep shadows brood, they afford soothing and solace; for even the little wild-flowers that stud the heath, and are so exquisitely fashioned, speak with a still small voice of the goodness of the Great Designer, whose tender mercies are over all his works.

Dartmoor is a granitic table-land, in the south-western part of the county of Devon. It is twenty miles in length, with an average breadth of eleven or twelve, and towards the north attains its greatest elevation in Cawsand Hill, which is 1792 feet above the sea-level. Instead, however, of being a flat expanse like Salisbury Plain, the ground is most uneven—here sinking into deep ravines, and there rising into gigantic tors; indeed, it has not inaptly been compared to the 'long rolling waves of a tempestuous ocean, fixed into solidity by some instantaneous and powerful impulse.' The younger Carrington, in speaking of the scenery met with in a walk from Shaugh Bridge to Sheep-Tor, describes it as follows:—'Huge crumbling rocks are piled on each other in fearful array, and some are half suspended in air. At irregular distances tower several craggy knolls, composed of disjointed masses of granite, hurled together in magnificent confusion, as if the genius of earthquake had stridden in wrath along the

hills, and these were the traces of his mighty footsteps. The rocks, however, are everywhere rendered beautiful by the magic hand of nature, which has clothed them with lichens of a thousand hues, and hung their shivered scalps with wreaths of the flaunting woodbine. Here and there the vagrant fancy may picture ruined donjon keeps, whose only banner is now the purple heath-bell, or the gorgeously speckled foxglove—watch-towers, whose only warder's voice is the hum of the summer bee revelling in the cup of a drooping wild-flower—and cathedral choirs, whose only anthem is the lonely chant of a hermit-bird.'

Tors innumerable throw their dark shadows athwart the moorland. The word 'tor' is Celtic, and signifies a beacon or fire-tower; and many of them—such as High Tor, South Brent-Tor, Three-Barrow-Tor, and Cawsand-Tor—were formerly used as such. Those who take the trouble to scale their rocky heights, are amply rewarded. Standing, for instance, on Three-Barrow-Tor, the eye, rapid as thought, can traverse the distance from Portland, in Dorsetshire, to the Lizard, in Cornwall. It also takes in at a glance the Blackdown Hills in Somersetshire, and the South-Hams of Devon, Plymouth Sound, with the adjacent scenery, and the British Channel. 'Sheep-Tor's dark brown rock' towers majestically aloft from a base covering 100 acres. Half-way up is a grotto, in which are seats and a spring of the purest water to refresh the wayfarer. In the mind of the peasant this is associated with the Pixies, or Devonshire fairies, whose palace he believes it to be; and he seldom withdraws without depositing some estate as an offering. It is related that an artist took refuge here during the Civil Wars, and adorned the walls with paintings, since which time it has been the occasional resort of gipsies and smugglers. In the tor itself are small deposits of silver, lead, copper, cobalt, and manganese, whilst in the river below, 'prills of gold' have been found; indeed, a miner is said to have obtained, some years ago, a sufficient quantity to sell for about £40 in Plymouth. The granite of Dartmoor contains felspar crystals of unusual size, and is much valued for the largeness of the blocks, as well as for its durability and fineness of texture. It is transported from the quarries by means of the Dartmoor railroad, which passes through a beautiful country, and has a length of more than twenty-five miles. This railroad, or tramroad, was opened for traffic 26th September 1823.

A great number of rivers have their origin in the water-absorbing soil of Dartmoor; indeed, no fewer than fifty-three streams of all sizes may be reckoned. After rain, many of these acquire a dark-brown coffee colour; hence the names Cherrybrook, Blackbrook, Redfordbrook, &c. The romantic Dart, the sylvan Plym, the Teign, and the Tavy, from which the Moor, as well as the towns of Plymouth, Teignmouth, and Tavistock, severally derive their names, all rise in this highland region. The prison at Prince Town is well worth inspection; its site is 1400 feet above the sea-level. At one time during the war, 10,000 prisoners were confined within its walls. The botanist will find in Dartmoor a welcome banquet. The ground is in many places covered with rich masses of vegetation, composed of lichen and moss, relieved by the purple glow of the heath (*Erica*), which here flowers in every variety. The beautiful round-leaved sundew (*Drosera rotundifolia*) sparkles like a thousand diamonds, the delicate white stone-crop (*Sedum album*) with its wax-like petals, the tormentilla, the elegant polygala, the thyme-leaved speedwell (*Veronica serpyllifolia*), the modest eyebright (*Euphrasia officinalis*), the dwarf red-rattle (*Pedicularis sylvatica*), the rose-coloured blossoms of the bog-pimpernel (*Anagallis tenella*), the yellow flowers of the bog-asphodel (*Narthecium ossifragum*), and the little white bed-straw (*Galium saxatile*), each breathing a poetry of its own, vie with each other in adorning this carpet of nature's weaving. The gay furze (*Ulex Europæus*) is not

unfrequently seen covered with the parasitic dodder (*Cuscuta epithymum*); whilst high up on the rugged tor, lichens, mosses, and clustering ivy, still paint the sterile soil. Here and there occur rings formed of irregular masses of granite, which are supposed to be the ruins of British round-houses, though some contend for Druidical remains, or sheep-enclosures; and there are doubtless a few who believe that none but the Pixies could have made those mystic circles. Throwing himself on the ground, the tourist is soon lost in contemplation—a brook is bubbling at his feet, the wild picturesque Moor, one rocky crag piled upon another, is all around; the light clouds flit across the summer sky; and here, where erst the early inhabitants of this island lived their wild life, he wonders what strange hands shaped and placed those crumbling stones.

It was on a fine afternoon last summer, when the weather seemed completely settled, that I set out with a friend upon a country walk, intending to return by way of the Moor; not a cloud dimmed the blue vault of heaven to the utmost verge of the horizon. We took the road to Ivy Bridge, and after examining the stupendous railway viaduct, with its massive granite piers, about which many a doleful prophecy was uttered before the railway was opened, and which, for the credit of the seers, should long since have tottered down, bringing with them railway, train, and passengers, to meet a worse fate than the Philistines whom Samson slew at his death; and after watching the Erme as, swollen by the rains, it danced and foamed over its rocky bed, and rushed madly on through the village, as if impatient to mingle its waters with the sea, we pushed up its wooded banks to Harford Bridge, and then getting on the Moor, made direct, as we supposed, for Ugborough Beacon. But evening was now throwing around her sombre shadows, and the thick fog, till then seen in the distance, advanced like an evil spirit, creeping over the highest hills, and descending into the deepest valleys. Rain pours down, the gloom increases, landmarks disappear, and all is now a waste as trackless as the Great Sahara. There is no moon to give its cheering light, nor pole-star to indicate the north. Through bog and brier, for many a mile, we wend our weary way. Hour after hour wings its flight, and brings us no nearer deliverance, till at length we strike into a road, rough and rugged, it is true, but still a *bond fide* road, in which ruts are deeply marked; hope revives, and we plod along its devious path, conjuring up many a tale of those who had lost themselves and perished on the Moor. The road, however, proves but a snare and a delusion, coming abruptly to a termination, after leading us further than ever from our route. But hark! a glad sound strikes upon the ear: it is the gush of water. We near the spot, and lo! a broad stream ripples over its pebbly bed; it is a river, perhaps the Erme; and according to the wise suggestion of my friend, after ascertaining which way it flows, we follow its welcome guidance, lighted here and there by the glowworm's friendly lamp. It is, however, no easy task to walk along its banks—here through yielding bog, and there over rough rocks and yawning chasms; but perseverance conquers; and just as the gray dawn begins to streak the heavens, we arrive, faint and weary, at Harford Bridge.

It is well to be acquainted with the fact, that when lost on Dartmoor, the best chance of escape is to follow the course of a river, or some tributary stream. The wanderer should descend into a valley, for there either one or the other can generally be found, and thus he may procure an unerring guide, which will sooner or later lead him to cultivated land and the habitation of man; otherwise, in endeavouring to find his way, he may walk round and round, and, like the doomed in the Grecian Tartarus, never arrive, with all his labour, nearer the attainment of his object. Many have thus

till they have died of fatigue and inanition; and in a snow-storm, when the plan just mentioned cannot be put in practice, or at least not so easily, there is little hope of deliverance; an instance of which occurred only last winter, when the soldiers from Prince Town were sepulchred in the drifting snow.

In the neighbourhood of the Moor, many tales may be heard of those who have lost their lives on the wild waste. A tradition has existed time out of mind, and which I have heard with various amplifications, of the melancholy fate of a bold hunter, the Nimrod of the Moor, who loved the mountain chase and mountain liberty, but was at last overwhelmed in a snow-storm. Even now, the shuddering peasant likes to tell the story.

And when the Christmas tale goes round  
By many a peat fireside,  
The children list, and shrink to hear  
How Childs of Plymstocke died!

It was a cheerless winter-morning, lowering, and ominous of snow and storm, that the rash huntsman resolved to range the forest in search of the noble red deer; but nothing daunted, and followed by a goodly company, he led the way.

With cheer and with shout, the jovial rout  
The old Tor hurried by;  
And they startled the morn with the merry horn,  
And the stanch hound's echoing cry!

The moorland eagle, the hawk and the raven, were scared from their prey, whilst on dashed the daring band, through rock-strewn glen and the river's bed.

But gallantly that noble deer  
Defies the eager throng;  
And still through wood, and brake, and fen,  
He leads the chase along.

Meanwhile, the wind whistles and howls around the old tors; now coming in fitful gusts, and then dying away in low murmurs, as if retreating to some rocky cavern, there to gather strength. The huntmen take warning, and one by one fly to shelter, till all are gone, and Childs pursues his way alone across the darkening Moor.

He threaded many a mazy bog,  
He dashed through many a stream;  
But spent, bewildered, checked his steed,  
At evening's latest gleam.

For, far and wide, the highland lay  
One pathless waste of snow;  
He paused—the angry heaven above,  
The faithless bog below.

Alas! will he never more lead on his merry huntsmen, nor hear the hound's deep bay? Must he in the hey-day of manhood perish in that awful solitude? Though stout of heart and strong of limb, he can go no further.

He paused—and soon through all his veins  
Life's current feebly ran;  
And, heavily, a mortal sleep  
Came o'er the dying man.

With the love of life yet strong, he tries a last resource: he kills his horse, in which, when disembowelled, he hopes to find warmth and shelter.

And on the ensanguined snow that steed  
Soon stretched his noble form—  
A shelter from the biting blast,  
A bulwark to the storm.

But all in vain. The envious snow drifts deeper and deeper around the lifeless horse, and his hapless master resigns himself to the fate that is now inevitable.

Yet one dear wish, one tender thought,  
Came o'er that hunter brave—  
To sleep at last in hallowed ground,  
And find a Christian's grave.

And ere he breathed his latest sigh,  
And day's last gleam was spent,  
He with unfaltering finger wrote .

His bloody testament:—

'The fyrste that fyndes and brings me to my grave,  
The lands of Plymstoke they shal have.'

It is said that this happened near Fox Tor. Childe, being without family, had previously resolved to endow that church with his lands in which his body should at last repose. The monks of Tavistock hearing of his melancholy end, hastened to seize the corpse, and so possess themselves of the property. They soon learned, however, that some people of Plymstoke were stationed at a certain ford with the intention of rescuing the remains of the huntsman from the wily Benedictines; upon which the latter caused a bridge to be thrown over the river, known afterwards as Guile Bridge. The monks finally accomplished their object, and retained possession of the lands till the dissolution of monasteries, when they were made over to the Russel family.

I will select only one more story, which must bring this paper to a close. A shepherd, whilst one day seeking some stray members of his flock, stumbled upon the emaciated body of a sailor, which to all appearance had remained for some weeks undiscovered. The head rested on a small bundle, whilst at the feet lay outstretched a dog, which had shared his master's fate. Carrington has a poem on this touching scene. It commences:

He perished on the Moor! The pitying swain  
Found him outstretched upon the wide, wide plain;  
There lay the wanderer by the quivering bog,  
And at his foot his patient, faithful dog.

The poet then goes on, as fancy dictates, to describe the sailor's deeds of daring in other lands, and how he

—Nobly dared, in danger's every form,  
The ocean battle and the ocean storm;  
Undaunted stood where on the blood-red wave  
The death-shot pealed among the English brave;  
Or scaled the slippery yard, where, poised on high,  
As the dread lightning burned along the sky,  
He fearless hung, though yielding to the blast  
Beneath him groaned the rent and trembling mast.

At last 'all danger's o'er,' he reaches his native land, and, with swelling heart and rapid foot, he presses on across the untrodden Moor, to the well-remembered spot where stands his native village, with its much-loved church, and, in imagination, he even hears the music of its bells. Many other pleasant dreams beguile his lonely way; but, alas!

Illusions all! down rushed the moorland night;  
He met the mountain tempest in its might.  
No guide to point the way, no friend to cheer;  
Gloom on his path, the fateful snow-storm near!

All by-gone perils he encountered in company with hearts as dauntless as his own, and

'Twas sympathy that all his toils assuaged.

But now he is alone with his faithful dog; he has no compass, and wanders about in the thickening storm, until, overcome with fatigue and sleep, he lies down to rise no more, his dog still watching by his side.

Thrice gallant brute! that through the weary day  
Shared all the perils of the lonely way;  
Faced the fierce storm, and, by his master's side,  
In the cold midnight, laid him down and died!

And so both master and dog took a long, long rest, and there remained through many a wintry day, till the good peasant stumbled upon them, and pitied the fate of the hapless sailor—

So cold, so pale, so shrunk that manly brow,  
That lip so mute, that eye so rayless now.

The highland shepherd, though his help came all too late to stay the cold hand of death, did what he could—

He saw and felt, and mourning at the doom  
Of the poor stranger, bore him to his tomb  
In the lone moorland church-yard: yet no stone  
Records his name—his home, his race, unknown;  
And nought remains of him in village lore  
But this sad truth: he perished on the Moor!

#### THE VAMPIRE BAT.

Ijorra shot a large bat of the vampire species, measuring about two feet across the extended wings. This is a very disgusting-looking animal, though its fur is very delicate, and of a glossy, rich maroon colour. Its mouth is amply provided with teeth, looking like that of a miniature tiger. It has two long and sharp tusks in the front part of each jaw, with two smaller teeth, like those of a hare or sheep, between the tusks of the upper jaw, and four, much smaller, between those of the lower. There are also teeth back of the tusks, extending far back into the mouth. The nostrils seem fitted as a suction apparatus. Above them is a triangular, cartilaginous snout, nearly half an inch long, and a quarter broad at the base; and below them is a semicircular flap, of nearly the same breadth, but not so long. I suppose these might be placed over the puncture made by the teeth, and the air underneath exhausted by the nostrils, thus making them a very perfect cupping-glass. I never heard it doubted, until my return home, that these animals were blood-suckers; but the distinguished naturalist, Mr T. R. Peale, tells me that no one has ever seen them engaged in the operation, and that he has made repeated attempts for that purpose, but without success. I observed no apparatus proper for making a delicate puncture. The tusks are quite as large as those of a rat, and, if used in the ordinary manner, would make four wounds at once—producing, I should think, quite sufficient pain to awaken the most profound sleeper. Never having heard this doubt, it did not occur to me to ask the Indians if they had ever seen the bat sucking, or to examine the wounds of the horses that I had seen bleeding from this supposed cause. On one occasion I found my blanket spotted with blood, and supposed that the bat, having gorged himself on the horses outside, had flown into the house, and fastening himself to the thatch over me, had disgorged upon my covering, and then flown out. There was no great quantity of blood, there being but five or six stains on the blanket, such as would have been made by large drops. I presumed, likewise, from the fact of the drops being scattered irregularly over a small surface, that the bat had been hanging by his feet to the thatch, and swinging about. The discovery of the drops produced a sensation of deep disgust; and I have frequently been unable to sleep for fear of the filthy beast. Every traveller in these countries should learn to sleep with body and head enveloped in a blanket, as the Indians do.—*Herdan's Valley of the Amazon.*

#### INSTANTANEOUS FLOWERING OF PLANTS.

The plants selected—a group of geraniums and a rose-tree—were planted in two rather deep boxes of garden mould, previously prepared with some chemical manure, and were then covered with glass-shades. Mr Herbert proceeded to pour over the roots, from a small watering-pot, a chemical mixture, which caused a great heat, as was shewn by an intense steam of vapour evolved within the shades, and allowed to some extent to escape through a small hole in the top, which at first was kept closed. The effect upon the geraniums was almost instantaneous, the buds beginning to burst in five or six minutes, and the plants being in full bloom within ten minutes, when the blossoms were gathered by Mr Herbert, and distributed amongst the ladies present.—*Year-book of Facts.*

## OLD LETTERS.

No two words could well be brought together, out of which a more pregnant meaning might be gleaned, than the above. Old letters! the very intonation of our voice as we utter them startles us. They summon up anew the long silent echoes of sounds heard only in that once world of youth—a chaos now—out of which we have passed; till, rising bodily before us, in this our later sphere, like severe rebuking spectres, come all buried joys, dead loves, sworn and forsworn friendships, and irreconcilable hates. Drag yonder chest from among the cobwebs that have gathered about it for thirty mortal years; take down the rusted key from the nail where it has hung so long. Does it grate and jar in the unused lock? What of that? The sound is significant, in perfect unison with the tone that shall vibrate through the heart's most secret chords when the mournful lid is lifted, and the indwelling spirit invoked, and the hollow sepulchre laid bare. But, courage! raise the groaning lid, and dive beneath the accumulated rubbish for the long-hoarded and long-neglected packet. Lay out, one by one before you, the motley muster-roll that holds in record the startling fictions of a life. Pah! a smell as of damp mould hangs about it like a charnel. A brave hand is needed to unloose the string: the knot resists, as though it felt the mercy of delay. But old men lack patience, and so you cut the Gordian-knot. Now, look as in a mirror, and behold. Ay, take them in order. Here is number one. The hand is bold and free, and bespeaks a heart at once frank and honest. This letter is signed Andrew. Knew you of such a name in your warm-blooded youth? Read, and tax your memory:—

MY DEAR GERVAIS—I write to you once more in the vain hope of a reply. Our school-days and school-boy promises seem to have died out together—at least on your part. Why is this? I can hardly shape my fears—but, Gervais, to speak plainly with you, I believe you love my cousin Alice. But whatever be the cause of your silence, I entreat you to end it, and to write to me; anything is better than this dead blank between us two who were once such sworn friends. If my surmise is right, pray, pray be open with me, Gervais: more, far more, hangs upon your answer than you dream of. I am too much agitated to write further. Your faithful friend,

ANDREW DUNCAN.

Be calm, old man; keep a quiet eye upon the records. What! trembling and abashed already? Does the first link of the chain electrify you? Pooh, pooh! courage. See, here is number two—a hand small and delicate, written, doubtless, with a dainty

crow-quill. These two handwritings have a strange and touching resemblance, like those of children brought up together under one roof. Was the boy the teacher of the girl? or can there be cousinship in caligraphy?

MY BELOVED GERVAIS—My cousin Andrew was here yesterday. He again questioned me closely about you, and left me in much agitation. There is some mystery between you two which I am unable to unravel. I cannot quite think with you that it is well to keep our engagement so entirely a secret; but your wishes are, and shall ever be, mine. I send this in haste, and by a trusted hand. Ever your devoted,

ALICE BLAIR.

Here follows a long hiatus. You know what comes next. The paper is black-bordered, the seal is black. It is a polite and punctilious invitation to attend the funeral of your school-friend and college-chum, Andrew Duncan. How cold it reads—like death! How unlike the hurried words leaping up from that heart now so cold and still. It gives you breathing-time. How do you employ the respite? Old man, your hands are before your face. Do you plead guilty? No!—'No, no!' you groan; 'not to this, not surely to his death; yet guilty—Oh, most guilty!' I see it all. You suspected—nay, in your secret soul, you *knew*—he loved his cousin Alice, the playmate of his childhood, the maiden-dream of his youth. But you shunned him; you shut your eyes to the knowledge. You played the craven; you quietly and secretly took the crown from his life, and set it on your own. And what was the issue to your friend? His fate in love sealed, he turned to ambition. The tale is brief enough: undue mental application, college honours heaped thickly upon him, a smile of mournful triumph, brain fever, and—death!

So many years have passed since that time, so entirely is your present man another than your past, that you wonder now, looking with strange eyes on your then world of thought and action, how such things could have been. You feel sure that you would act differently—with a nobler, higher intent, a more self-sacrificing spirit, were the thing to be done anew, the life lived over again. You see very clearly now, since the issues are before you, and each separate fate worked out, that a little plain-speaking, a little candour, a small amount of faith in yourself, a modicum of courage to meet the worst that might befall, and, above all, a spirit of reliance thirsted for, prayed for, and obtained from above, might have held together, in mutual dependence, those dropped links of happiness whose falling away so mars the beautiful chain of life. Even humanly and selfishly speaking, all might have gone equally well with you—your love-suit prospered, your

friend been reconciled, had all been conducted openly and fairly. Andrew was a youth of good promise: had you honestly told him how it stood with you, and at once shewn that Alice's affections, unconsciously drawn towards you, had justified your suit, he would at least have been spared the half-seeming and half-real treachery of his friend, and might have found a later peace in your counsel and companionship when, beneath the gentle touch of time, the barbed head of the arrow should have become a little worn down. So we can reason who stand apart, secure and out of the pale of those temptations which beset us in youth. Could we, as actors, reason thus when the time for action is before us, how few would be the follies, to say nothing of the crimes, committed in the world!

But let us dismiss this phase of error; let the worm of conscience drag it down, as a dead leaf, to serve possibly a similar purpose with the dropped autumnal foliage, in becoming the nutriment of an after and healthier state of being. Yonder lies a packet, to whose bulk other hands, your own included, have contributed. The characters writ by the strange hands are clear and legible; yours alone are blurred, blotted, scrawled, and interlined. Why, what have we here? The rise and progress of a duel!—a thing in these days almost done to death by the loud voice of public opinion, sound rationality, and, above all, Christian teaching. But stay, here is an interloper—a letter slipped by some mischance out of a different packet, and crept in among the terrors of this, like a blessing dropped unaware from lips accustomed but to cursings. It is from some forlorn recluse, some 'undone widow,' returning a mother's broken heart of thanks for a small yearly stipend bestowed on her and her children by one Gervais Headstrong. Friend Gervais, your eyes are glistening through your moistened spectacles as they meet this widow's mite of prayer and heart-blessing! Feel you not warmed and comforted to the core? Seems not your hearth more glowing, the very room where you sit and ponder more pleasant and cheery than its wont? Without, do not the very trees, bare, ice-blasted winter though it be, bud, and leaf out, and blossom before the genial warmth of one good deed? My life on it, they do, old man! And now, once more to the packet. The first on the list is a fair and business-like epistle: it runs thus:—

SIR—Yours of this morning, favoured by your intended second, Captain F., duly reached me. I accept your challenge, the time and place of your own naming. The friend who bears this is authorised to act for me in this matter, and will arrange with yours all necessary preliminaries. I am, Sir, yours, &c., ARTHUR BURT.

Passing by the remainder of those epistles which arrange, in formal and prescribed terms, the work of 'honourable' murder, let us glance at your own effusions, not those intended for the world's eye, but one written rather with a forecasting mental reference to—your (widow) that may be.

MY BELOVED WIFE—When this reaches you, it is but too probable that I shall have breathed my last. My friend, Captain F., will explain to you all the particulars of this unfortunate affair, and you will, I trust, feel that I have been in no way to blame in the matter, but have only acted as every man must act to whom the honour of his hearth is sacred. The insinuations of my antagonist with reference to you—the words uttered in a public ball-room, could be erased only by the blood of one, it may be, of both. O Alice! if you have ever doubted my love, and sometimes I have thought— But no matter: if ever I have been other to you than the fond and confiding husband I vowed to prove myself, forgive me now when all is over between us two! May Heaven bless and watch over, is the fervent prayer of your devoted husband,

Gervais Headstrong.

But, Gervais, how came this letter in your possession, seeing that it was addressed to your wife? Methinks it was in this wise. On the untoward occasion of your meeting in Battersea Fields, somehow or other, the whole affair of the duel missed fire. Both pistols having been seized with a sudden fit of relenting, or, what is still more probable, having been somewhat diverted from their horizontal by certain qualms of conscience, acting on minds not quite dead to the perception of a law higher and holier than the duellist's so-called 'honour,' sent off each in turn a solitary signal-shot towards heaven, pleading for God's grace to spare the lives he gave from the outrage about to be committed. And so—and so—and so, the principals shook hands vigorously, and the seconds coolly and in dudgeon, as feeling themselves the more foolish party of the two; and the ground was remeasured back with more eager but less steady paces, to the now purified region of home. The thunder of the pistols had cleared the matrimonial atmosphere: the wife's honour was now intact. And the letter? Oh! next morning Captain F. found it lying somewhat crumpled, in his great-coat pocket, and gave it back to Gervais. What! and was all this amount of genuine pathos absolutely wasted? Absolutely and entirely so; for Gervais had the wisdom to keep his own counsel—his wife never heard the light passing words which had given rise to so much needless pacing of the ground, nor ever suspected, to her dying day, how nearly her good Gervais had paid dear for his strict adherence to the absurd code of men of honour.

Next in order comes a tiny packet, comprising a year by year memorial of birthday-offerings and Yuletide gifts. Each diminutive note has its appropriate hand, from the five-year child's first illegible scrawl, to the school-boy's regulation round text done in little. Painful enough memorials these! Some of the small hands whose work lies here, yellowing with the first touches of time, are still and cold now; and the fresh young hearts, whose thanks burst out so warm from the core, are gathered and garnered where time touches them not. For the loss of those younger ones who are passed away, leaving behind them yonder faded witness of bloom gone down to the dust, friend Gervais feels little now, so well has time done its work on him; or, at least, he feels little of that deep crushing sorrow, which visits him as his eyes light on one other and far different memorial—one, too, of more recent date, slipped in here by some such mischance, as has been already noticed, and containing not thanks but entreaties. And now, old Gervais, brace thyself up, and muster thy best strength to go through with the work before thee, for thou shalt have need of it all. This letter lying before thee is written in the man-grown hand of thy first-born and last-surviving son. Ay, look well at its concluding phrase and superscription—'Your affectionate and dutiful son, Gervais.' Yes, old man! he was the son given to your prayers, to shew you all your virtues in a fairer light, teaching with the subtle beauty of youth how good a thing it is to have once been fresh in heart and blameless in spirit. How dear you with the boy? Look well to it, and answer truly, for it is not to be done again: the time is gone—the tree is felled—the lamp burned out—the 'bowl broken at the fountain!' You are silent?—Let, then, the dead answer for the living.

MY DEAREST FATHER—I almost fear to anger you by renewing my application, since you have not answered either of my former letters; nor should I do so, but for the extreme urgency of the case, and the very awkward and humiliating position in which I find myself. I am well aware that you consider my present allowance sufficient to meet all college expenses; perhaps I should have made it suffice. I am willing to own that I may have been a little imprudent. But I found it very difficult to avoid incurring a few trifling

debts, in order to do as others do here—things absurd enough in themselves, doubtless, yet failing to do which one is called a 'milk-sop.' What I asked was no very heavy amount; and believe me, my dearest father, if I had thought you could not well afford to assist me at this juncture, I would have quitted college at once, and have resigned the promising future before me (and you believe that I have really worked hard), rather than make the request. At anyrate, do write to me, or I shall begin to think that I have transgressed beyond hope of pardon. Your affectionate and dutiful son,

GERSVAIS.

Your old sin, again, Gervais!—failing to write; wrapping yourself up in the mantle of your own dominant will, and pride or passion of the hour. Heaven forgive you, Gervais Headstrong, for a great wrong, a crying wrong lies at your door. He is gone from you who, in your cold, selfish, worldly fashion you loved so well—or at least were so proud of. 'Ay,' you answer, 'he is gone; but his death was not of my dealing.' No: down on your bended knees for that at least! No, you did not kill him; but you broke his young spirit: you left him to disgrace and shame. He died, indeed, a natural death; but how can you look upon his grave and not shrink with loathing from yourself; you who were rolling in wealth, satiated with luxury, and yet denied out of your abundance what was fitting and right to your own flesh and blood! Close up the letter: would you could seal it for ever from your memory as from your eyes! 'Look on it again you dare not; yet at your last hour it will rise up before you; and when men shall see a slow film stealing over your death-vision, it will be that which is darkening earth and heaven to you!

Enough, Gervais; shut down the lid, turn the key, safe padlock the dread records of your past life and deeds. Roll the old worm-eaten chest back again to its lair among the dust and cobwebs, and—'to bed—to bed.'

## THINGS AS THEY ARE IN AMERICA.

### NEW YORK CONCLUDED.

**STANDING** on the steps of the Astor House, we have the thoroughfare of Broadway right and left, with the Park in front—Barnum's theatre, covered with great gaudy paintings, across the way—and can here perhaps better than anywhere else, observe the concourse of passengers and vehicles. Accustomed to the flow of omnibuses in London, the number of this variety of public conveyance though great, does not excite surprise. That which appears most novel, is the running to and fro of railway-cars on East Broadway, a thoroughfare terminating opposite to us at the extremity of the Park. Already I have spoken of a railway-train being brought in detachments by horses into the heart of the city; but this is only one of several such intrusions. Permitted, for some mysterious reason, by the civic authorities, lines of rail are laid along several prominent thoroughfares—an exceedingly convenient arrangement as regards transit from one part of the city to another, but not quite pleasant, I should think, to the inhabitants of these streets and squares through which the cars make their perambulations. The cars on these street-railways are hung low, seated like an omnibus, and will stop at any point to take up or set down passengers. The ordinary omnibuses of New York have no cad behind. The door is held close by a cord or belt from the hand of the driver, who relaxes it to allow the entry or exit of the passengers. I was amused with the manner in which the fare is taken in these vehicles. The passenger who wishes to be set down, hands his money through a hole

in the roof to the driver, who forthwith relaxes the cord, and the door flies open. As there appeared to be no check on two or more departing when only one had paid, I suppose the practice of shirking fares is not very common. I cannot say that the omnibus-system of New York is an improvement on our own. The drivers are still more unconscionable in their reception of extra passengers, particularly if the applicants be ladies. In such cases, the gentlemen either stand or take the ladies on their knee. I happened to see a cram of this kind two or three times; and I observe that the abuse forms a theme of jocular complaint in the New York newspapers.

The necessity for seeking vehicular conveyance arises not more from the extreme length of the city, than the condition of the principal thoroughfares. I am indeed sorry to hint that New York is, or at least was during my visit, not so cleanly as it might be. Statists assure us that it possesses 1500 dirt-carts, and in 1853 cost the sum of 250,000 dollars for cleaning. Where these carts were, and how all this money was expended, I cannot imagine. The mire was ankle-deep in Broadway, and the more narrow business streets were barely passable. The thing was really droll. All along the foot-pavements there stood, night and day, as if fixtures, boxes, buckets, lidless flour-barrels, baskets, decayed tea-chests, rusty iron pans, and earthenware jars full of coal-ashes. There they rested, some close to the houses, some leaning over into the gutter, some on the door-steps, some knocked over and spilt, and to get forward you required to take constant care not to fall over them. Odd as this spectacle seemed on Saturday at noon, it was still more strange on Sunday, when bells were ringing and people were streaming along to church. Passing up Broadway on this occasion, and looking into a side-street, the scene of confused debris was of a kind not to be easily forgotten—ashes, vegetable refuse, old hats without crowns, worn-out shoes, and other household wreck, lay scattered about as a field of agreeable inquiry for a number of long-legged and industrious pigs. I often laugh at the recollection of these queer displays, and wonder whether the boxes and barrels of ashes are yet removed from Broadway, or whether Pearl, Nassau, and Fulton Streets have seen the face of a scavenger!

It was a delicate subject to touch upon, but I did venture to inquire into the cause of these phenomena. One uniform answer—maladministration in civic affairs; jobbing of members of the corporation into each other's hands. Considering that the body labouring under these imputations was chosen by popular suffrage, the blame thrown upon them, I thought, was as much due to the electors as the elected. Something, in explanation, was said of the overbearing influence of the lower and more venal class of voters; but giving all due weight to an argument of this kind, it seemed to me that we had here only a vivid demonstration of that species of desertion of public duties, which is seen in London and other great marts of commerce, where men, being too busy to mind anything but their own affairs, leave the civic administration to the idle, the selfish, and incompetent. Be this as it may, things at the time of my sojourn had come to a deplorable pass. You could not take up a newspaper without seeing accounts of unchecked disorders, or reading sarcasms on official delinquencies. In the *New York Herald* for November 28, 1853, the following passages

occur in an article on Rowdies—a class of brawling reprobates who molest the public thoroughfares:—

'The insecurity of human life in New York has become proverbial; and it is a grave question with many, whether it is not practically as bad to live under the despotism of a felonious rabble as the tyranny of an aristocrat. Our police, with a few exceptions, are the worst in the world. It is a notorious fact that they are seldom in the way when crimes are committed, and when they see them by accident, they are very likely to skulk away and avoid all danger and difficulty. If a bank or some wealthy individual has lost a large sum of money, they will probably get hold of it, because they calculate upon a handsome reward. But when they know they cannot make anything extra—anything beyond their salary—there is not one in a hundred of them will give himself the least concern about the lives or limbs of the citizens who pay them for protection. We perceive that their pay has increased of late. We don't find that it has contributed very much to increase their vigilance. The whole evil lies in a nut-shell—it is the accursed system of politics that prevails at primary elections, and thence spreads its ramifications over the entire social fabric. Strike at the root, and the poison-tree will fall.'

Perhaps the most appalling feature in the economy of New York, is the number of fires, many of them involving enormous losses of property. According to an official report quoted in a newspaper, the amount of property destroyed by fire in New York in 1853, was 5,000,000 of dollars. In not a few instances, it has been feared that these conflagrations are the work of incendiaries for the sake of plunder; though I incline to the belief that they originate in a more simple cause—the headlong speed and incautiousness with which affairs are ordinarily conducted. When fires do occur, they are greatly facilitated by the slenderness of inner partitions and wooden stairs in the houses; and though the exertions of the fire-brigades are generally beyond all praise, they are not able to prevent extensive destruction and loss. The frequency of these conflagrations, which sometimes involve a sacrifice of life as well as of property, cannot, however, be said to have met with that serious attention which such grave casualties would seem to demand. The stimulus to push forward in business acting like a species of intoxication, appears to cause an indifference to misfortune. In short, there is no time to ponder over losses—no time even to avoid being cheated. An anecdote in illustration of the impetuous way in which matters are managed, was told to me as a remarkably good thing of its kind. Two men, one day, with a long ladder and proper implements, gravely proceeded to take down the metal rain-conductor from a house of business, and carried it off without question or molestation. A few days afterwards they returned, restored the tube to its place, also unchallenged, and having finished operations, presented an account for repairs, &c., which was instantly paid, the truth being that no mending was required, and the whole affair a trick; but the parties plundered had no time for inquiry, and settled the demand in order to be done with it. How many petty exactions are daily submitted to on the same principle!

As a great emporium of commerce, growing in size and importance, New York offers employment in a variety of pursuits to the skilful, the steady, and industrious, and on such terms of remuneration as leaves little room for complaint. It would, however, be a prodigious mistake to suppose that amidst this field for well-doing, poverty and wretchedness are unknown. In New York, there is a place called the Five Points, a kind of St Giles's; and here, and in some other quarters of this great city, you see and hear of a sink of vice and misery resembling the more squalid and dissolute parts of Liverpool or Glasgow. For this the

stranger is not prepared by the accounts he has received of the condition of affairs in America. Wages of manual labour, a dollar to two dollars a day. Servants, labourers, mechanics, wanted. The rural districts crying for hands to assist in clearing and cultivating the ground. Land to be had for the merest trifle. The franchise, too, that much-coveted boon, offered to all. Alas! man's destiny, on whichever side of the Atlantic, is not altogether to live by voting, but by working. What signify high wages, land, and liberty, if people shew no disposition to earn and make a proper use of these advantages—if, instead of labouring at some useful occupation, they habitually squander away existence, and do all sorts of wicked things to keep soul and body together. New York contains many thousands of this order of desperates, or call them unfortunates, if you will—men ruined by follies and crimes in the old country; 'outfitters' sent abroad by friends who wish never more to see or hear of them; refugee politicians, who, after worrying Europe, have gone to disturb America (which, fortunately, they are not able to do); beings who might have lived creditably in the Golden Age, but who possess no accurate ideas of the responsibilities of this drudging nineteenth century; immigrants weakened and demoralised by their treatment on board ship; and to sum up with an item which includes nearly everything else—intemperates living upon their wits and the bottle. Collectively forming a mass of vice and wretchedness, we have here, in fact, a 'dangerous class,' the cryptogamia of society, flourishing in dark holes and corners, just as it is seen to do in any large city of the Old World. Is it an ordination of nature that every great seat of population shall contain so much human wreck?

From whatever cause it may originate, New York is beginning to experience the serious pressure of a vicious and impoverished class. Prisons, hospitals, asylums, juvenile reformatories, alms-houses, houses of refuge, and an expensive, though strangely ineffective police, are the apparatus employed to keep matters within bounds. The governors of a cluster of penal and beneficiary institutions report, that in 1852, they expended 465,109 dollars in administering relief to 80,357 persons. Passing over any notice of the many thousands, including crowds of recently arrived immigrants, assisted by other associations, we have here a number equal to 1 in 7 of the population, coming under review as criminals or paupers in the course of a year—a most extraordinary thing to be said of any place in a country which offers such boundless opportunities for gaining a respectable subsistence. Let Europe, however, bear her proper share of the shame. Of all who pass through the prisons, or stand in need of charitable assistance, it is found that 75 per cent. are foreigners; and the cheerful and untiring manner in which relief is administered to so many worthless and unfortunate strangers, surely goes far to extenuate the reproach of 'dollar worship,' which has been cast on the American character. To fortify the weak and lift the fallen, much is humanely attempted to be done through religious agencies. Bible and tract societies, and church-missions, make extraordinary exertions; and the industrious and affluent, moved by representations from the press, are uniting in efforts for social improvement. At the time of my visit, the subject of a better class of dwellings for the working-classes was agitated; and looking at the overcrowded houses, and the excessively high rents paid, it seemed to me that a movement of this kind was desirable. Since my return home, an unsuccessful effort has been made to pass a law for shutting up the taverns (the number of which was 5980 in the early part of 1853); these establishments being believed to be a main source of all the prevalent vice and poverty in the city.

If New York has the misfortune to suffer from an accumulating mass of crime and poverty, it cannot be

said that she takes little pains to avert this calamity through the efficacy of religious ministrations or elementary education. In 1853, the city contained 254 churches, conducted, I believe, with a zeal equal to anything we can offer. From personal examination, I am able to speak with greater precision on the subject of school instruction. The educational system of New York, in its higher and lower departments, is on a singularly complete scale. Independently of a number of private academies, there are as many as 230 schools, of which twenty-two are for coloured children, in all of which education is entirely free. These free schools, which are judiciously scattered through every locality, and open to all, are supported entirely by funds granted from the revenue of the municipality—the appropriation having been 633,813 dollars, or about £125,000 sterling for the current year. Such is the considerate liberality of the city corporation in maintaining the schools and keeping up their efficiency, that one would almost be disposed to think that this much abused body is, after all, not so bad as it is called. I fear that more is done than the people properly appreciate. The registered number of pupils in the various free schools on the 1st of January 1853, was 127,237; but it appears that the average attendance was only 44,596\*—a fact which throws a curious light on the method of training youth. With a profusion of schools, nothing to complain of in the routine of instruction, and nothing to pay, it is certainly strange to find that, on an average, many more than one-half of all the children nominally at school, were absent; though from what cause is not explained. According to recent accounts, it would appear that the poverty and neglect of parents rendered it as necessary in New York as in London or Edinburgh, to supplement all the ordinary means of education with a class of schools for the ragged vagrants of the streets—so close is the analogy becoming between the condition of cities in the New and Old World.†

That education of an elementary kind should be offered without charge to all classes of children, at the public expense, will not appear so surprising as that instruction even up to the higher branches of study may be obtained by any youth in New York who claims and is found prepared for receiving such a boon. I allude here to the operations of the Free Academy, which may be described as the crowning-point of the free-school system. This institution I felt much interest in visiting. It occupies a large building, more like a college than a school, and in reality is a college in all but the name. Under the superintendence of fourteen professors and a number of tutors, I found upwards of 400 youths, divided in classes and accommodated in different apartments, receiving an education of the most liberal kind at the public cost. Mathematics, Classics and modern languages, Oratory, Drawing,

Composition, and the Natural Sciences, were among the subjects taught; a large library is also open to the pupils. The annual charge on the school-fund for this academy is about 20,000 dollars. The public support of such an establishment is considered, I believe, to be of doubtful policy. The most obvious objection is, that public property is taxed to educate a select number with professional aims in view. It must, however, be borne in mind, that the child of the poorest is as eligible as the child of the most wealthy citizen; the only test for admission being the ability to pass a suitable and impartially conducted examination. I felt no small pleasure in learning that social distinction was totally unknown in the academy; and that at least thirty of the boys were the sons of persons in a humble rank of life.

The progress of refined tastes in New York has been significantly marked by the establishment of a Crystal Palace, emulative of similar constructions in Europe, and which I considered myself fortunate in arriving in time to visit. Placed in a somewhat confined situation in Reservoir Square, towards the northern extremity of the city, the edifice was not exteriorly seen to advantage, and was rather cramped in its proportions. Although considerably less in size than the Irish Exhibition, and a pigmy in dimensions as compared with the palace at Sydenham, it was, nevertheless, a fine thing of its kind, and must have furnished a fair idea of the nature and appearance of the Great Exhibition in Hyde Park. In shape it was a cross, 365 feet long each way, with a lofty dome in the centre, 100 feet in diameter. Some lesser erections filled up the angles of the cross, and with a separate building of two stories for machinery in the lower, and pictures in the upper gallery, the whole afforded space for a highly respectable exhibition. The interior arrangements and style of decoration bore a close resemblance to what was observed in the structure in Hyde Park—courts for particular classes of productions, rows of statuary, galleries with flags and drapery, and stands for the lighter articles of manufacture.

To this Exhibition, Great Britain, France, Austria, the Netherlands, and other European countries, had contributed objects of useful and ornamental art; but the bulk of the articles shewn were American, and testified to the extraordinary progress in industrial pursuits. It was observable, that this progress embraced little in pictorial art, or the higher order of design. Of the collection of 654 paintings, the greater number were from Germany, Holland, France, and England; the whole contributed by the United States being about forty. One picture I had seen previously—the First of May, by Winterhalter, which represents the Duke of Wellington presenting a casket to his godson, the young Prince Arthur; it was contributed to the Exhibition by Queen Victoria, and attracted many admirers. In the fine arts, America cannot yet be reasonably expected to rival Europe; though under the fostering influence of wealth, that rivalry will, of course, come in time. What the Americans do excel in, is the invention of tools, machinery, and miscellaneous objects directly useful. In these departments, therefore, there was material for profound meditation; and in seeing the ingenious and beautifully executed implements in wood and metal, and machines for saving and expediting labour, I wished that England had not been satisfied with deputing two or three commissioners to attend the opening of the Exhibition, but that whole companies of mechanics had come to admire and be instructed. Altogether, the Exhibition afforded a striking specimen of native skill and resources; and a conviction was left on the mind, that to treat either that skill or these resources with indifference, would be highly impolitic. Besides being much pleased with the machinery at rest and in motion, including some finely executed steam-engines, I felt much interest in the

\* Annual Report of the Board of Education of the city and county of New York, 1853.

† With the princely fortunes accumulating on the one hand, and the stream of black poverty pouring in on the other, contrasts of condition are springing up as hideous as those of the Old World. . . . There should be a cure which should go to the source of our social evils in the great cities. . . . In the meantime, we call attention to the efforts now being made by various parties in our city to meet these increasing wants. A circular appears in another column from an association of ladies, acting in connection with the Children's Aid Society, which shews the character of these enterprises. A Ragged School, or, better named, an Industrial School, is opened, where the children who are too poor for the public schools are taught a common-school education and a means of livelihood. A soup-kitchen is connected with the establishment. The labour, as in the London Ragged Schools, is mostly performed by volunteers; though here, entirely by ladies, often from our highest and most intelligent circles. We understand there are now eight of these schools in the city. It is a new feature in New York high life—this active labour and sympathy for the poor. Much of it may be a fashion, like most of our New York impulses; still it is a noble fashion. It is the first step towards bridging over this fearful gulf now widening between different classes.—*New York Tribune*, April 21, 1854.

extent and variety of minerals, the collection of which was remarkably perfect. Coal, salt, marbles, metals, and other articles, all found in abundance, pointed to the amount of hidden wealth in the several states. Coal of the richest kind was also exhibited from Nova Scotia; but the sight of it suggested the unpleasing reflection, that the great mineral fields of that ill-used province, gifted by a late English sovereign to a favourite, are pretty nearly useless either to the possessor or the public.

On the occasion of my visit, the Exhibition was crowded with a well-dressed and orderly company; and I should fancy that as respects the education of the eye in matters of taste, it must have been productive of good effects. Unfortunately, it proved a lamentable failure as a commercial enterprise. Originated and conducted by a joint-stock company, with only honorary patronage from government, the Exhibition, at its close, was found not to have paid its expenses—not so much from any imperfect appreciation of its merits, as from delays in opening. The design, I believe, is to reopen and permanently keep up the Exhibition with some new and attractive features, under the presidency of the immortal Barnum!

In New York, the means of social improvement, through the agency of public libraries, lectures, and reading-rooms, are exceedingly conspicuous. One of the most munificent of these institutions, is the recently opened Astor Library, founded by an endowment of the late John Jacob Astor, who bequeathed a fund of 400,000 dollars to erect a handsome building and store it with books for the free use of the public. I went to see this library, and found that it consisted of a splendid collection of 100,000 volumes, a large proportion of which were works in the best European editions, properly classified, with every suitable accommodation for literary study. The New York Mercantile Library, and the Apprentices' Library are institutions conducted with great spirit and of much value to the community. A very large and handsome building was in process of erection at a cost of 800,000 dollars, by a benevolent citizen, Mr Peter Cooper, for the purpose of a free reading-room and lectures. The limited space at my disposal does not enable me to particularise other institutions of this class, or to notice the learned societies in which the higher order of intellects co-operate.

The prevalence of education throughout the United States leads, as may be supposed, to a taste for reading, which finds the widest indulgence in easily acquired newspapers and books. Newspapers are seen everywhere in the hands of the labouring as well as the wealthy classes. Every small town issues one or more of these papers, and in large cities they are produced in myriads. In the streets, at the doors of hotels, and in railway-cars, boys are seen selling them in considerable numbers. Nobody ever seems to grudge buying a paper. In the parlours of public-houses and hotels in England, a newspaper is handed from one person to another, because the purchase of a copy would be expensive; but we see little of this practice in America. Every morning at the Astor House, I should think some hundreds of newspapers were bought by the guests. At breakfast, almost every man had a paper. And I believe I may safely aver, that no working-man of any respectability goes without his paper daily, or at least several times a week. Newspapers, in a word, are not a casual luxury, but a necessary of life in the States; and the general lowness of price of the article admits of its widest diffusion.

Many of these papers are only a cent—equal to a half-penny—each; but two or three cents are a more common price, and some are charged five or six cents. Compared with the expensively got up and well-written morning papers of London, the American

newspapers, though low-priced, are scarcely entitled to be called *cheap*. Much of their space is occupied with advertisements, and in some cases the whole readable matter amounts to a few paragraphs of news and remarks connected with party politics. Indulgence in personalities is usually, and with truth, regarded as the worst of their editorial features. In this respect, however, they cannot be said to differ materially from many of the newspapers of the British provinces; and recollecting with shame the recent libellous malignities of certain English newspapers directed against a high personage, we are scarcely entitled to speak of the editorial imperfections of the Americans as altogether singular. Such as they are, and low in price, the newspapers of the United States fulfil an important purpose in the public economy; and with all their faults, the free discussion of every variety of topic in their pages is, as some will think, better than no discussion at all. In nothing, perhaps, is there such a contrast between Great Britain and America, as in the facilities for disseminating newspapers. In the former country, newspapers can hardly be said to reach the hands of rural labourers. We could, indeed, point out several counties in Scotland which cannot support so much as a single weekly paper; but depend for intelligence on a few prints posted from a distance—such prints affording no local information, and throwing no light whatever on the peculiar, and it may be unfortunate, political and social circumstances in which the people of these counties are placed. On the other hand, such is the saliency of thought, such the freedom of action, in the United States, that a town has hardly time to get into shape before its newspaper is started; and as one always leads to two, we have soon a pair of journals firing away at each other, and keeping the neighbourhood in amusement, if not in a reasonable amount of intelligence. While it may, therefore, suit the policy of England to centralise and deal out opinion according to certain maxims of expediency, and also by every ingenious device to limit the number of newspapers, the people of the United States, taking the thing into their own hands, have organised a press as universal and accessible as the most ordinary article of daily use. On the establishment of a newspaper among them, there are no fiscal restrictions whatever. There is no stamp, and, consequently, no vexatious government regulations requiring to be attended to—no particular form of imprint necessary. Exempted likewise from paper-duty, and never having been burdened with a tax on advertisements, they are in every sense of the word free. The transmission of newspapers by post in the United States is on an equally simple footing. A newspaper despatched to any place within the state in which it is published, is charged only half a cent (a farthing) for postage, and when sent to any other part of the United States, a cent; but in this latter case, if a quantity be paid for in advance, the cost is only the half-cent. It is proper to state, that these charges do not include delivery at the houses of the parties addressed—that being the subject of a separate small fee; and it is here, both as regards letters and newspapers, that the superiority of the British post-office system is conspicuous.

Decentralising in principle, the newspaper system of the States still relies for the more important items of home and foreign intelligence on the prints of the large cities, which spare neither pains nor expense, by electric telegraph or otherwise, in procuring the earliest and most exciting news. In this respect, New York may be said to take the lead, by means of several newspapers conducted with a remarkable degree of energy—among which may be noticed the *Herald*, *Tribune*, *Post*, and *Commercial Advertiser*. In connection with this prominent feature of New York, it seems proper to state that this city has latterly acquired importance, if not for literary production, at least for the dispersion of

books; encroaching, so far, on the older literary marts of Boston and Philadelphia. Periodically in New York there occur great sales by auction to the trade—not of mere parcels of books, but whole editions prepared for the purpose, and transmitted from publishing houses in different parts of the Union. These sales, like the book-fairs of Leipzig, attract purchasers from great distances, and literary wares are disposed of on a scale of extraordinary magnitude. New York likewise possesses a number of publishers of books, original and reprinted, though, so far as I could judge, the works, generally, are not of the same high-standing as those which are issued from the long-established and classic press of Boston. As a place of publication, New York is best known for its periodicals, of which, with newspapers included, there are as many as a hundred and fifty addressed to every shade of opinion.

By the politeness of Mr Dana, I was conducted over the printing establishment of the *Tribune*, and had pointed out to me a machine resembling one I saw several years ago in the *Times* printing-office, and which was turning out broadsheets with inconceivable rapidity. At the large book-manufacturing concern of the Messrs Harpers, which I visited a few days previous to the fire, the machinery employed was more novel. Thirty-four flat-pressure steam-presses, all afterwards destroyed, were producing the finest kind of work, such as is still effected only by hand-labour in England, into which country the inventor, Adams of Boston, would doubtless be doing a service to introduce them. The practice of stereotyping by an electric process, so as to multiply plates at a small cost, and as yet scarcely known in England, was also in use at the same office. The enormous demand for every moderate-priced product of the press, has, of course, necessitated the resort to these simplifications of labour. The circulation of *Harpers' Magazine* is stated to be upwards of 100,000 copies, which no hand-labour could produce, nor cylinder-printing properly effect, considering the fineness of the wood-engravings usually interspersed through the letter-press. Unfortunately, with every disposition to admire the vigour displayed by the Harpers in conducting their popular miscellany, one can entertain little respect for a work which systematically adopts articles, often without acknowledgment, from English periodicals. Occupying a much higher literary status, is the monthly magazine, started a year ago by Mr G. P. Putnam, whose efforts in cultivating native American talent, and in sustaining a work of a purely original character, will, we hope, be crowned with the success which they deserve.

In the course of my rambles through the printing-offices of New York, I alighted upon an establishment in which the *Household Words* of Mr Dickens was furnishing employment to one of the presses. As yet, the present sheet had been exempted from sharing in the glory of an unauthorised transatlantic impression, and I had reason for gratulation accordingly. But who can tell what a few days may bring forth? Since my return to England, *Chambers's Journal* has yielded to its destiny, and, side by side with Mr Dickens's popular print, affords what is thought a fair ground for enterprise to a publisher in New York. It has sometimes been remarked of George III., that instead of fighting his American subjects, he would have shewn somewhat more prudence by removing, family, court, and all, to the States; and so leaving Great Britain, as the lesser country, to shift for itself, as a colony. Some such plan of packing up and removal might almost be recommended to persons designing to follow out a course connected professionally with any department of literature. Already, certain English publishing-houses are turning attention to the great and ever-extending field of enterprise in the United States, where books, as in the case of newspapers, are not a

bold furniture of those depending for subsistence on daily labour. With a view to partaking in the advantages to be derived from the universal demand for literary products in the States, some kind friends strongly counselled the transference of myself bodily to New York; and though coming rather late in the day, the idea was not without its allurements. In one respect, at least, the American possesses an advantage over the English publisher: he is not subjected to heavy taxation in carrying on his operations. When I mentioned to the publishers of New York, that the various works issuing from the establishment with which I was connected, and addressed mainly to classes to whom it was of importance to the state itself that literature should be made as accessible as possible, were loaded with a tax of 10,000 dollars per annum in the form of paper-duty, no small wonder was expressed. 'Why,' said they, 'continue to spend your existence in a country in which the earnings of industry are laid under such heavy contributions?' The inquiry might more pertinently have been put to a younger man, or to one who had fewer inducements to 'stick to the old ship;' but it is exactly the kind of question which, considered in its different aspects, is now drawing away so many eager minds across the Atlantic.

W. C.

#### SHAMYL.

THE mountain-chief, whose exploits for so many years have won the admiration of Europe, Shamyl, the warrior-prophet of the Caucasus, was born towards the end of the last century, at a town called Himri, situated in one of the wildest parts of Circassia. He was early educated in the two chief departments of Oriental knowledge—religion and arms; and many traits of truly Spartan courage are related of him. On one occasion, while a mere child, he was attacked and wounded by some comrades; but although his life was endangered, he continued to conceal what had happened, because he would not consent to admit that he had been vanquished even by numbers.

For a long time Shamyl occupied a comparatively subordinate position as one of the Murides, or body-guards of Hamsad Bey, the Imâm. It was only after the assassination of that chief, in one of the civil contests which weakened Circassia and favoured the advance of Russia, that the celebrated warrior made himself known. He was elected to succeed the fallen Imâm by general acclamation, and having ruthlessly avenged the crime that had been committed, began that career which has since obtained for him a world-wide renown. The means by which he obtained his popularity are not well known. As yet, we are in possession only of fragments of Circassian history for the last twenty years. But it appears certain that Shamyl, though stained by many grievous faults, possesses noble qualities, and is eminently fitted to rule over a barbarous people.

He is of middle height, with gray eyes and red hair. His complexion is white, and as delicate as that of the Circassian beauties who are sometimes exposed for sale in the private bazaars of Constantinople. Perhaps the contrast of his feminine appearance with his extraordinary courage and impassibility in the presence of danger, may have strongly contributed to excite admiration among his rude and swarthy countrymen. All reports speak of him as gentle even when ordering acts of the greatest cruelty. He is sober in food; and scrupulously obeys the injunction of the Prophet, to drink no wine—allowing his followers, however, full

suffice for him; and whilst his full-fed body-guard snore around, he rises, and somewhat ostentatiously employs himself in reading and prayer. A poet of Daghestan has said, that 'he has lightning in his eyes and flowers on his lips;' for, like all popular leaders, he has the gift of eloquence, and gains his victories as much by oratory as generalship. All his proclamations are in gorgeous language; and it is said that nothing can equal the effect of the short orations he delivers to his troops before he leads them on to victory.

The first residence of Shamyl, after he was raised to supreme rank, was Achulgo, where he built, in the centre of the fortress, a little house in the European style, with the assistance of Russian prisoners and deserters. Here he lived in the humblest possible style, depending even for daily bread on the spontaneous offerings of his people. The fortress is built of the rudest rocks; and in 1839 was surrounded by defences of earth, with passages, covered-ways, and moats, according to the best rules of science. The solid wooden towers, useless against artillery, had been removed, so that when General Grabbe appeared before it, after having taken Arquani and forced the passage of the Koi-sou, he at once understood the necessity of a regular siege. His first impulse, indeed, was to retreat; but remembering the orders of the emperor, hoping, too, to terminate the war with glory by the capture of Shamyl, he determined on an attack. The difficulties to be overcome were immense; but the troops under his command were numerous, and accustomed to passive obedience. The mountaineers by degrees found their communications cut off. They were completely surrounded, and hunger and thirst began to tell upon them with more fatal effect even than the dreaded cannon of their enemies.

It was on the 23d of August 1839, that, the advanced ramparts having been taken, the Russian general ordered his men to storm the citadel. The Circassians now displayed almost supernatural courage. Even the women took part in the struggle, sword and pistol in hand. 'Never,' says a Russian eye-witness, 'have I beheld so horrible a spectacle. We swam in blood. We climbed over barricades of men. The death-rattle was our martial music. I was clambering at the head of my battalion, already decimated, up a steep ascent; the cannon had ceased to roar—the wind blew away the sombre curtain of smoke: we suddenly beheld on a platform overhanging an abyss, a number of Circassian women. They knew that victory had declared against them, but firmly resolved to perish rather than fall into the hands of the Russians. They rolled enormous blocks of stone from the summit of the precipice. A huge mass whirled past me, and carried away several of my soldiers. I thought of the Eumenides. In the heat of the conflict, they had thrown away their tunics; and their hair streamed wildly over their bare shoulders. I saw a young woman sitting down quietly with her infant in her arms; suddenly, as we approached, she arose, dashed her infant's head against a rock, and then leaped with it into the abyss below. The others followed one by one, and all were dashed to pieces.'

The great object of this sanguinary attack was to take Shamyl; but the prophet was found neither among the dead nor among the wounded. A whisper went abroad that he was concealed in a cave, and every rock was searched without success. Towards midnight, some sentinels heard a noise. A man descended a precipice by means of a cord. When down, he examined the ground, gave a signal, and immediately came a second, and then a third wrapped in a white cloak, such as Shamyl was accustomed to wear. The Russians now disclosed themselves, and took all three prisoners. But their joy threw them off their guard; and the real Shamyl—for he in the white cloak was only a decoy—darted by, leaped into the Koi-sou, and swam across

untouched by the shower of balls sent after him. This wonderful escape of course added to the prophet's reputation; and it is not surprising that his people believe him to be the especial favourite of Allah. The lovers of the marvellous pretend that on one occasion Shamyl allowed himself to be taken prisoner under another name, was conducted to St Petersburg, obtained the rank of colonel in the army, and having learned the art of war and the secrets of the enemy, escaped back to his own country. This extraordinary man, however, has no need of fiction to exalt his merits as a patriot-chief.

Having been driven out of Achulgo, Shamyl removed his residence to a place called Dargy Wedenno, situated in the midst of dense forests and frightful precipices. It is from this place that he has since, with various success, directed the operations of the war, issuing forth at critical periods, and exciting his people by his presence, but taking care not needlessly to expose his person, or to diminish the prestige of his name by too frequent appearances. Sometimes he has been reduced almost to the last extremity of despair. The Russian general, Woronzoff, by far the most formidable enemy ever sent against Circassia, cut roads through the country; and instead of making periodical attacks on a grand scale, endeavoured to weary out the mountaineers by constantly marching to and fro in every direction. Many tribes were entirely surrounded and compelled to submit; and at length the Tchetches found themselves unable to maintain their independence. They resolved, therefore, to send ambassadors to Shamyl, asking him either to come and assist them, which they knew he could not, or to allow them to submit to Russia. No one, however, would venture voluntarily to carry such a message; and four men were chosen by lot. They set out for Dargy, and determined by means of gold to buy the intercession of the mother of Shamyl, that he should at least hear what they had to say, and accept or refuse. They easily succeeded in inducing the poor old woman to speak to her son. What passed at the interview was kept a secret; but horrible results were feared, for the prophet immediately afterwards retired to the mosque to fast and to pray. He remained there until late next morning; and then appearing amidst a general assembly which he had ordered to be called together, announced, with many circumlocutions, that the Tchetches had formed the infamous project of submitting to the Giaours; that they had sent messengers to plead their excuse; that these messengers had suborned a woman to make him the disgraceful communication; that he had asked counsel of the Prophet; and that the Prophet had ordered him, from Allah, to give a hundred lashes with a whip to the woman who had been suborned. 'That woman,' he added in a terrific voice, 'is my mother!' There was a thrill of expectant horror, and the mother of Shamyl, with a shriek, fell upon the ground. The stern chieftain continued: 'What was my amazement when I heard this order! I wept bitter tears. Mohammed then obtained from Allah that I might substitute myself for the sinner. I am ready!' So saying he descended from his position, and ordered two of his guards to perform the office of executioner upon him. They refused at first, but were compelled to obey. At the fifth blow, the blood started; but the people now rushed forward, snatched the whips from the hands of the men, and insisted that so painful a scene should not continue. The Tchetch ambassadors now expected that their time was come; but to their surprise, and that of every one, Shamyl pardoned them, and said: 'Go back to your cowardly countrymen, and tell them what you have seen!'

It would be impossible, within any reasonable space, to give an outline of the various operations which Shamyl has directed against the Russians. Indeed, accurate details are not yet known; and it is to be

feared that tradition alone will hand them down to posterity. But it is not only as a warrior and enthusiast that Shamyl is distinguished; he is remarkable also as a legislator. By his influence, the people of Daghestan, previously divided into rival sects and tribes, have been melted down into a mass almost homogeneous; and he has established many useful institutions. His country is partitioned into twenty provinces, each under its naib or governor. Four of them are invested with absolute authority; the others are obliged to give periodical reports of their actions. Each naib is obliged to raise 300 horsemen, one from every ten families under his jurisdiction. The soldier's family is exempt from all taxes: the others pay his expenses. Every man, however, from fifteen to fifty, is, properly speaking, a soldier, ready to act on any great emergency. Shamyl himself has a body-guard of 1000 men, kept under rules of monastic severity. By their means he restrains the insubordination of such amongst his people as occasionally grow impatient of his iron yoke. Formerly, all contributions were voluntary; at present, a regular system of taxation has been introduced. If, therefore, at any future period Circassia is relieved from external pressure, it may be found that the foundations of a durable state have been laid. For the first time has any organisation been successfully introduced. Yet it is possible that when the immediate motive for union has been removed, discord may again reign. Some incompetent person may succeed to Shamyl before the people have become completely accustomed to order; so that we cannot foretell with any degree of certainty what may be the future fortunes of Daghestan.

#### PANOPTICS AND POLYTECHNICS.

THERE is a building of somewhat pretentious character in Leicester Square, which has just now put forth its claim to a share of the shillings appropriated by the world for rational amusement. This building is the 'Panopticon of Science and Art'—a sort of superior 'Polytechnic,' built by a company or society who seem to aim at something more than has been realised in the older institution.

These establishments are not unimportant as a token of the spirit of the age. The puppet-show and the dancing-dolls are giving way to something better in the way of mechanical ingenuity; while the really good music now to be heard almost nightly at Exeter Hall and St Martin's Hall, is certainly better than anything which the middle classes were accustomed to listen to a few years ago. It may be not the less true, at the same time, that the diminution of rural sports in the country districts is somewhat to be regretted, leaving the country people little else to depend upon for recreation than the village alehouse. In towns, however, and especially in such a world of a place as London, it is out of the question to look for such things. We cannot have primitive open-air sports in the metropolis, to any great extent: there is not room for them, and, moreover, the hours of work leave very little time for their enjoyment. Our recreation must be chiefly within walls and under roofs—more is the pity, some will say; but it is useless to kick against the irresistible necessities of a monster-city covering more than sixty square miles; we must bend to those necessities, and must see how to bend in the most rational manner and to the most useful purpose.

Exhibitions akin to the Polytechnic and the Panopticon are altogether of modern growth; they may be said to have only commenced in the boyhood of those

who are now but in middle life. In France, the system began earlier than in England, under the auspices—as most great undertakings are in France—of the government.

Exhibitions of manufactures and pieces of mechanism may perhaps be said to have commenced, in England, by the establishment of the Museum of the Society of Arts. Many thousands have seen this, and many more might see it than seem to be aware of the fact, for the society offer many facilities for the admission of strangers. This old museum, with its raw materials and its models of machines, is worthy of a visit. The same society has lately established special exhibitions, illustrative of some special branch of art or science, which seem likely to have a wide sphere of utility. The museums and exhibitions of the Asiatic Society, of the East India Company, of the United Service Institution, of Economic Geology, of Marlborough House, of Gore House—all, to a certain degree, may be regarded as exhibitions of science and art, belonging to certain permanent bodies. But besides these, there have been others which have either been private speculations, or have had relation to some special purpose at a particular time and in a particular place. Before the establishment of the Adelaide Gallery, there was an exhibition of science and art in a building on the site of the present National Gallery; it was a humble affair, but interesting of its kind, and did something towards creating a taste for this kind of instructive amusement. The Adelaide Gallery—with its steam-gun, its combustion of steel, and its manufacturing illustrations—will be fresh in the memory of many visitors to London. Why it is that the Gallery has ceased to be a science and art room, to become a music and dancing room, it is not for us to say: probably questions of pounds, shillings, and pence have had a controlling influence here as elsewhere. A more powerful body established afterwards the Polytechnic Institution in Regent Street—an institution which for many years has given a most ample shillingworth of instruction and amusement to those who have chosen to enter its doors, and which seems to become stronger instead of weaker, as it becomes older. There is a more obvious attempt here to combine science and fine arts with manufactures, than in the exhibitions hitherto noticed. The Great Free-trade Bazaar at Covent Garden Theatre, nine years ago, was a remarkable example of collected industrial products. The occasion was a special one, and the display was more purely industrial or manufacturing than anything to which we had before been accustomed. Not only has the metropolis had these opportunities of seeing exhibitions of manufactures, but the provinces occasionally share in the advantage. There was an Exposition of Industrial Art at Manchester in 1846; there was an exposition at Birmingham in 1849; there have been polytechnic exhibitions at Liverpool and at Leeds; there was a small Dublin Exhibition in 1850, and a great Dublin Exhibition in 1853; and there have been exhibitions and expositions, polytechnic, industrial, and scientific, in a large number of towns within the last ten years. Some of these have been a kind of pleasure-soirées, while others have had direct relation to the shillings and sixpences received at the doors; but all have been entirely independent of any aid from the government; and in this respect they contrast strikingly with the expositions of France. The nature and character of these polytechnic exhibitions—such as were opened at Leeds and Liverpool some years ago—were pretty fully described in a paper in the Second

Series of the Journal (No. 14), to which we may here refer the reader.

It will be seen, from this sketch, that we associate the new Panopticon with these industrial and artistic exhibitions. It is indeed an example of that which the vast Sydenham Palace is intended to be—an attempt to combine science and fine art and productive industry, so far as illustrative examples are concerned, under one roof. The Panopticon, according to its full title, is an 'Institution for Scientific Exhibitions, and for promoting discoveries in Arts and Manufactures.' About four years ago—for indeed the preparation of the building and its contents has been a very lengthy affair—a royal charter was obtained, which set forth the objects of the institution yet more fully. They were declared to be—'To exhibit and illustrate, in a popular form, discoveries in science and art; to extend the knowledge of useful and ingenious inventions; to promote and illustrate the application of science to the useful arts; to instruct, by courses of lectures, to be demonstrated and illustrated by instruments, apparatus, and other appliances, all branches of science, literature, and the fine and useful arts; to exhibit various branches of the fine and mechanical arts, manufactures, and handicrafts, by shewing the progress to completion in the hands of the artisan and mechanic; to exhibit the productions of nature and art, both British and foreign; to illustrate history, science, literature, and the fine and useful arts, by pictorial views and representations; to illustrate the science of acoustics by lectures, music, and otherwise; to give instruction in the various branches of science and the mechanical arts; to afford to inventors and others facilities to test the value of their ideas by means of the machinery, instruments, and other appurtenances of the institution; and, generally, to extend and facilitate a greater knowledge and love of the arts and sciences on the part of the public.' This is indeed a long programme; and any institution which realises all these aims will be panoptic, pan-technic, polyoptic, and polytechnic, all in one. The projector and present managing director of the institution is Mr E. M. Clarke, who has served a long apprenticeship in such matters. Nearly thirty years ago, he was instrumental in establishing the first mechanics' institution in Ireland; in 1880, he took part in the Exhibition of Science and Art, at the spot where now the National Gallery stands, and afterwards in the establishment of the Adelaide Gallery; and he was one of the small body who originated the Polytechnic Institution. The Panopticon sets forth a formidable body of honorary officials; there are nearly twenty patrons, nearly as many members of the council, about thirty associates, who are philosophers, musicians, sculptors, painters, and literati, besides the paid officers. What the duties of the associates are, we do not at present see.

It is obvious, on a first visit, that only a portion of the objects of the institution can at present be carried out; it seems as if it will require time for its development. This much may be said, however, that the Panopticon appeals to the eye and the ear in a very striking and original manner. Looking at the front of the building as it presents itself on the east side of Leicester Square, we see a bold attempt to adopt the Saracenic or Moorish style of architecture. There is a façade of eleven windows in width, and five stories in height; some of the windows are ornamented with the Moorish arch, some with arabesque ornament, while the porch or doorway displays the Moorish form still more decidedly. Over the two extreme ends of the building are two minarets; and over the centre, somewhat in the rear, is the cupola or summit of a large rotunda. Whether this ornate and Oriental-looking façade, resplendent with gilding and bright colours, assorts well with the plain ugly English houses on either side, is quite another matter; it is difficult to

say what that is beautiful can assort well with the frontage of London houses. The escutcheons of Purcell, Davy, Newton, Goldsmith, Herschel, Shakespeare, Barry, Watt, and Bacon, take part in the decorations of the façade. The Moorish porch is so far an example of modern art, that it is formed chiefly of Ransome's artificial stone, inlaid with Minton's encaustic tiles. Within, or rather under the arch of the porch, is a sort of arabesque porticulis, in cast iron. The porch gives entrance to a vestibule, glittering on every side with adornments in variegated alabaster and encaustic tiles; and beyond this is an inner porch, leading from the vestibule to the grand rotunda.

This rotunda is the *magnum opus*, the work to which the time, and the money, and the skill of the Institution have been mainly directed. A gorgeous and striking chamber it certainly is. Consistently with its name, it is circular, and is surmounted by a cupola. The diameter and the height are each nearly 100 feet. There are three galleries at different heights; and what with the pillars by which these galleries are supported, the Moorish arches by which the pillars are surmounted, the arabesque ornaments by which the interior of the cupola is completely covered, the gilding, and painting, and glass about the pillars and galleries, and the Oriental lamps whereby the whole is lighted in the evening—the effect is exceedingly novel. The floor is for the most part boarded; but in the centre is an elaborately inlaid basin, whence springs up a fountain-jet to a height of eighty or ninety feet, and eight minor jets to half this height; the water is derived from an Artesian well, 346 feet deep; the mosaic of the basin consists chiefly of enamelled slate, bordered with coloured-glass tessellation—an ancient art, which has only been lately revived in England.

With what, then, is this remarkable rotunda filled, and how does it subserve the objects of the institution? First, and before everything else, both for sight and sound, is the organ—an instrument worth a visit, if there were nothing else to see. Messrs Hill were required to make an organ which should fill the building with a vast body of rich sound, and at the same time harmonise in appearance with the peculiar style of decoration around. Both of these behests have been admirably attended to. The organs at Birmingham and York are grand productions; but this at the Panopticon is said to exceed them both in tone and in compass. It is difficult to make organ phraseology intelligible to ordinary readers; but those who know a little concerning the mechanism of an organ, will understand us perhaps when we say, that the organ has four manuals or key-boards; that each manual extends from CC to A in alt; that there is also a pedal-organ of 30 notes; that there are 60 stops, 7 couplers, 10 composition pedals, 1 crescendo pedal, and 4004 pipes (the *Handbook* of the Panopticon will puzzle some of its readers by the announcement that the number of pipes is 4,0004); that there are 7 bellows; that these bellows are worked by steam-power; that the swell, choir, and solo organs have duplicate manuals, so that three performers can play together if desirable; that there is a pneumatic arrangement of the key and draw stops, which lessen the physical exertion of the player; and that the dimensions of the instrument are 36 feet wide, 48 high, and 28 deep. The organ occupies a recess on the eastern side of the rotunda; and its own adornments, as well as those of the recess which contains it, add greatly to the beauty of the rotunda. But it is when the organ speaks with its many-toned voice that it becomes a thing of power. Under the skilful fingers of Mr Best, its grandeur, sweetness, and variety of tone appeal irresistibly to the ear; the sounds wind round the circular saloon, and come to every hearer with extraordinary richness.

We can hardly help thinking that this organ will kill everything else in the building. This is a matter,

however, which every visitor must decide for himself. The contents of the rotunda also may be regarded as pertaining to three classes—the artistic, the scientific, and the industrial. The artistic or fine-art productions are chiefly sculptures and copies of sculptures, some of them placed under crimson and gold canopies in somewhat theatrical style. The scientific productions comprise enormous electrical and galvanic apparatus, electric-telegraphs, optical apparatus, diving-bell apparatus, and—in the uppermost gallery—a photographic collection. The industrial productions and specimens are represented by a series of Whitworth's metal-working machines, an ascending room worked by steam-power, a subaqueous balloon, a carbonic acid apparatus, a freezing apparatus, pin-making and needle-making machines, sewing and weaving machines, parquetry, ornamental turning and fret-cutting, hat-making, bead-purse making, fringe-making, papier-maché, &c. Except Whitworth's machines, and some agricultural implements, most of these workmen's and tradesmen's stalls and counters are in the galleries.

As it is not in mortals to achieve perfection, it may not be wondered at if there be some little drawbacks in this splendid rotunda. Its very rotund form—a source of so much beauty, is also a source of some defects, both to the ear and the eye. First, in respect to the ear: Every one who has been in the Whispering Gallery at St Paul's, knows that sound is conducted and augmented in an extraordinary manner by the circular form of the building. Now, at the Panopticon the same thing is observable, in a smaller degree: all the sounds, pleasant or not, become very audible. It was our fortune to hear, on one occasion, while Mr Best was playing Mozart's magnificent *Qui s'degno* on the magnificent organ, a clacking accompaniment of weavers' shuttles, in a stall some ten or twelve yards from the organ. In a building of different shape, the sound of the shuttle might be buried in a little receptacle of its own; but in this rotunda no sound can be buried. It is possible that some mode of obviating this defect may be adopted when the institution gets into complete working-order. In respect to the eye, the circular form of the rotunda renders it difficult so to separate the articles exhibited that the artistic, the scientific, and the industrial may be viewed separately: all these may be interesting and valuable, but they do not suit well when mingled up together. From one point of view, an electric-telegraph, a sculptured group, an iron-planing machine, an optical instrument, a statue under a crimson canopy, and an assemblage of pitchforks, and rakes, and shovels—all meet the eye at once; nor do we well see how this incongruity is to be avoided, if all three classes of objects are illustrated in one circular room. All this may, however, be susceptible of improved arrangement when the plans of the institution are more fully carried out.

The rotunda is, as we have said, the chief room in the building; but there are others of subordinate character. There are two lecture-rooms or theatres—one for scientific illustrations, and one for literary and musical entertainments. In front of the organ is a spacious platform or music-room, in which it is proposed that Mr Best shall give instructions in organ-playing at hours when the public exhibition is not open. At the top of the building is a photographic department, where portraits are taken, and where instructions are given in this beautiful art. There is a laboratory in the lower part of the building, where instructions are to be given in chemical science, and analyses conducted.

Whether we regard the Panopticon as a scientific institution, with a little music and sculpture thrown in to lighten it; or as a graceful artistic exhibition, with a little science and manufactures thrown in to give it serious and solid import; or as an attempt to combine

the light and graceful with the solid and useful on equal terms—it must be regarded as a welcome addition to our metropolitan pleasure-spots. No disrespect to an old acquaintance, the Polytechnic, however: there is room for both.

### THE THIRTEENTH JUROR.

WHEN the criminal, Pierre Granger, escorted by four gendarmes, was placed in the dock of the court of assize, there was a general stir amongst the crowd, which had assembled from every quarter to be present at his trial.

Pierre Granger was not an ordinary culprit, not one of those poor wretches whom the court, as a matter of form, furnishes with an advocate, judges in the presence of a heedless auditory, and sends to oblivion in the convict prisons of the state. He had figured at length in the columns of the newspapers; and while M. Lépervier had undertaken his defence, M. Tourangin, the attorney-general, was to conduct the prosecution. Now, at the time of which I write, these two men stood at the head of their profession. Whenever it was known that they were to be pitted against each other in any cause, crowds immediately flocked to enjoy their eloquent sentences, sonorous periods, and phrases as round and as polished as so many billiard-balls. It was a perfect riot of tropes and figures, a delicious confusion of periphrases and metaphors. All the figures of rhetoric defiled before the charmed auditory, and sported, jested, and struggled with each other, like Virgil's playful shepherds. There was a luxury of epithets, passing even that of the Abbé Delille. Every individual substantive was as regularly followed by its attendant adjective, as the great lady of the last century by her train-bearing page. In this pompous diction—a man became a mortal; a horse, a courser; the moon was styled pale Dian. My father and my mother were never called so, but invariably the authors of my being; a dream was a vision; a glass, a crystal vase; a knife, a sword; a car, a chariot; and a breeze became a whirlwind; all which, no doubt, tended to produce a style of exceeding sublimity and beauty. Pierre Granger was a clumsily-built fellow, five feet ten in height, thirty-eight years old, with foxy hair, a high colour, and small cunning gray eyes. He was accused of having strangled his wife, cut up the body into pieces, and then, in order to conceal his crime, set fire to the house, where his three children perished. Such an accumulation of horrors had shed quite a romantic halo round their perpetrator. Ladies of rank and fashion flocked to the jail to look at him; and his autograph was in wonderful request, as soon as it became known that Madame Césarine Langelot, the lioness of the district, possessed some words of his writing in her album, placed between a ballad by a professor of rhetoric and a problem by the engineer-in-chief of the department; neither gentlemen, to say the truth, being much flattered by such close juxtaposition with the interesting pet-prisoner.

When Pierre Granger, with his lowering brow and air of stolid cunning, was placed in the dock, the names of twelve jurors were drawn by lot, and the president demanded of the counsel on either side, whether they wished to exercise their right of challenge. Both declined offering any objection to twelve such honourable names; but the attorney-general added, that he would require the drawing of a supplementary juror. It was done, and on the paper appeared the name of Major Vernor. At the sound, a slight murmur was heard amongst the spectators, while MM. Tourangin and Lépervier exchanged a rapid glance, which seemed to say: 'Will not you challenge him?' But neither of them did so; an officer conducted Major Vernor into his appointed place, and amid profound silence the indictment was read.

Major Vernor had lived in the town during the last two years. Every one gave him the military title, yet none could tell when, or where, or whom he had served. He seemed to have neither family nor friends; and when any of his acquaintances ventured to sound him on the subject, he always replied in a manner by no means calculated to encourage curiosity. 'Do I trouble my head about *your* affairs?' he would say. 'Your shabby old town suits me well enough as a residence, but if you don't think I have a right to live in it, I shall be most happy to convince you of the fact at daybreak to-morrow morning with gun, sword, or pistol.' Major Vernor was precisely the very man to keep his word: the few persons who had entered his lodgings, reported that his bedroom resembled an armoury, so fully was it furnished with all sorts of murderous weapons. Notwithstanding this, he seemed a very respectable sort of man, regular in his habits, punctual in his payments, and fond of smoking excellent cigars, sent him, he used to say, by a friend in Havannah. He was tall, excessively thin, bald, and always dressed in black; his moustaches curled to a point; and he invariably wore his hat cocked over his right ear. In the evenings, he used to frequent the public reading-room of the town; but he never played at any game, or conversed with the company, remaining absorbed in his newspaper until the clock struck ten, when he lit his cigar, twisted his moustaches, and with a stiff, silent bow took his departure. It sometimes happened that one of the company, bolder than the others, said: 'Good-night, major!' Then the major would stop, fix his gray eye on the speaker, and reply: 'Good-night, monsieur;' but in so rude and angry a tone, that the words sounded more like a malediction than a polite salutation.

It was remarked, that whoever thus ventured to address the major, was, during the remainder of the evening, the victim of some strange ill-luck. He regularly lost at play, was sure to knock his elbow through a handsome lamp or vase, or in some way to get entangled in a misadventure. So firmly were the good townfolk persuaded that the major possessed an 'evil eye,' that their common expression, when any one met with a misfortune, was: 'He must have said "good-night" to the major!'

This mysterious character dined every day at the ordinary of the Crown Hotel, and although habitually silent, seemed usually contented with the fare. One day, however, after having eaten some bread-soup, he cast his eye along the table, frowned, and calling the host, said: 'How comes it that the dinner to-day is entirely meagre?'

'Monsieur, no doubt, forgets that this is Good-Friday.'

'Send me up two mutton chops.'

'Impossible, major; there is not an ounce of meat to be had at any butcher's in the town.'

'Let me have some fowl.'

'That is not to be had either.'

'What a set of fools!' exclaimed the major, striking his clenched hand on the table with such force that the bottles reeled and rocked, just as if all the wine in their bodies had got into their heads. Then he called the waiter, and said: 'Baptiste, go to my lodging, and bring me the inlaid carabine which hangs over my pillow.'

The poor host trembled, and grew very pale, when Baptiste returned with a double-barrelled gun, beautifully inlaid with silver. The major coolly examined the locks, put on fresh caps, cocked both barrels, and walked out, followed at a respectful distance by the guests and inmates of the hotel. Not far off stood an old ivy-mantled church, whose angular projections were haunted by many ravens: two large ones flew out of a turret just as the major came up and took aim for a double shot. Down tumbled both the unclean birds at his feet.

'*Sacrebleu!*' cried he, picking them up; 'I'm regularly sold—they're quite lean!'

He returned to the hotel, and, according to his express orders, one moiety of his ill-omened booty was dressed in a savoury stew, and the other simply roasted. Of both dishes he partook so heartily, that not a vestige of either remained, and he declared that he had never eaten more relishing food.

From that day the major became an object of uneasiness to some, of terror to others, of curiosity to all. Whenever he appeared on the public promenade, every one avoided him; at the theatre, his box was generally occupied by himself alone; and each old woman that met him in the street, invariably stopped to cross herself. Major Vernor was never known to enter a church, or accept an invitation: at first, he used to receive a good many of these, and the perfumed billets served him to light his cigars.

Such, then, was the thirteenth juror drawn in the cause of Pierre Granger, and it may easily be understood why the audience were moved at hearing the name of Major Vernor.

The paper of accusation, notwithstanding, drawn up by the attorney-general with a force and particularity of description which horrified the ladies present, was read amid profound silence, broken only by the snoring of the prisoner, who had deliberately settled himself to sleep. The gendarmes tried to rouse him from his unnatural slumber, but they merely succeeded in making him now and then half-open his dull brutish eyes.

When the clerk had ceased to read, Pierre Granger was with difficulty thoroughly awakened, and the president proceeded to question him. The interrogatory fully revealed, in all its horror, the thoroughly stupid fiendishness of the wretch. He had killed his wife, he said, because they couldn't agree; he had set his house on fire, because it was a cold night, and he wanted to make a good blaze to warm himself: as to his children, they were dirty squalling little things—no loss to him or to any one else.

It would be tedious to pursue all the details of this disgusting trial. M. Tourangin and M. Léperrier both made marvellously eloquent speeches, but the latter deserved peculiar credit, having so very bad a cause to sustain. Although he well knew that his client was as thorough a scoundrel as ever breathed, and that his condemnation would be a blessing to society, yet he pleaded his cause with all a lawyer's conscientiousness. When he got to the peroration, he managed to squeeze from his lachrymal glands a few rare tears, the last and most precious, I imagine, which he carefully reserved for an especially solemn occasion—just as some families preserve a few bottles of fine old wine, to be drunk at the marriage of a daughter or the coming of age of a son.

At length the case closed, and the president was going to sum up; but as the heat in court was excessive, and every one present stood in need of refreshment, leave was given to the jury to retire for half an hour, and the hall was cleared for the same space of time, in order that it might undergo a thorough ventilation. During this interval, while twelve of the jurors were cooling themselves with ices and sherbet, the Thirteenth lighted a cigar, and reclining in an arm-chair, smoked away with the gravity of a Turk.

'What a capital cigar!' sighed one of the jurors, as he watched with an envious eye the odoriferous little clouds escaping from the smoker's lips.

'Would you like to try one?' asked the major, politely offering his cigar-case.

'If it would not trespass too much on your kindness.'

'By no means. You are heartily welcome.'

The juror took a cigar, and lighted it at that of his obliging neighbour.

'Well! how do you like it?' asked the major:

'Delicious! It has an uncommonly pleasant aroma. From whence are you supplied?'

'From the Havannah.'

Several jurors now approached, casting longing glances on Major Vernor's cigar-case.

'Gentlemen,' said he, 'I am really grieved that I have not a single cigar left to offer you, having just given the last to our worthy friend. To-morrow, however, I hope to have a fresh supply, and shall then ask you to do me the honour of accepting some.'

At that moment, an official came in to announce that the court had resumed its sitting; the jury hastened to their box, and the president began his charge. Scarcely had he commenced, however, when the juror who had smoked the cigar rose, and in a trembling voice begged permission to retire, as he felt very ill. Indeed, while in the act of speaking, he fell backwards, and lay senseless on the floor.

The president, of course, directed that he should be carefully conveyed to his home, and desired Major Vernor to take his place. Six strokes sounded from the old clock of the Town-hall as the jury retired to deliberate on their verdict in the case of Pierre Granger.

Eleven gentlemen exclaimed with one voice, that the wretched assassin's guilt was perfectly clear, and that they could not hesitate for a moment as to their decision. Major Vernor, however, stood up, placed his back against the door, and regarding his colleagues with a peculiarly sinister expression, said slowly: 'I shall acquit Pierre Granger, and you shall all do the same!'

'Sir,' replied the foreman in a severe tone, 'you are answerable to your conscience for your own actions, but I do not see what right you have to offer us a gratuitous insult.'

'Am I, then, so unfortunate as to offend you?' asked the major meekly.

'Certainly; in supposing us capable of breaking the solemn oath which we have taken to do impartial justice. I am a man of honour'—

'Bah!' interrupted the major; 'are you quite sure of that?'

A general murmur of indignation arose.

'Do you know, sir, that such a question is a fresh insult?'

'You are quite mistaken,' said Major Vernor. 'What I said was drawn forth by a feeling of the solemn responsibility which rests on us. Before I can resolve to make a dead corpse of a living moving being, I must feel satisfied that both you and I are less guilty than Pierre Granger, which, after all, is not so certain.'

An ominous silence ensued; the major's words seemed to strike home to every breast; and at length one of the gentlemen said: 'You seem, sir, to regard the question in a philosophical point of view.'

'Just so, Monsieur Cerneau.'

'You know me then?' said the juror in a trembling voice.

'Not very intimately, my dear sir, but just sufficiently to appreciate your fondness for discounting bills at what your enemies might call usurious interest. I think it was about four years ago that an honest, poor man, the father of a large family, blew out his brains, in despair at being refused by you a short renewal which he had implored on his knees.'

Without replying, M. Cerneau retired to the furthest corner of the room, and wiped off the large drops of sweat which started from his brow.

'What does this mean?' asked another juror impatiently. 'Have we come hither to act a scene from the *Memoirs of the Devil*?'

'I don't know that work,' replied the major; 'but may I advise you, Monsieur de Bardine, to calm your nerves?'

'Sir, you are impertinent, and I shall certainly do myself the pleasure to chastise you.'

'As how?'

'With my sword. I shall do you the honour to meet you to-morrow.'

'An honour which, being a man of sense, I must beg respectfully to decline. You don't kill your adversaries, Monsieur de Bardine; you assassinate them. Have you forgotten your duel with Monsieur de Sillar, which took place, as I am told, without witnesses? While he was off his guard, you treacherously struck him through the heart. The prospect of a similar catastrophe is certainly by no means enticing.'

With an instinctive movement, M. de Bardine's neighbours drew off.

'I admire such virtuous indignation,' sneered the major. 'It especially becomes you, Monsieur Darin'—

'What infamy are you going to cast in my teeth?' exclaimed the gentleman addressed.

'Oh, very little—a mere trifle—simply, that while Monsieur de Bardine kills his friends, you only dishonour yours. Monsieur Simon, whose house, table, and purse are yours, has a pretty wife'—

'Major,' cried another juror, 'you are a villain!'

'Pardon me, my dear Monsieur Calfat, let us call things by their proper names. The only villain amongst us, I believe, is the man who himself set fire to his house, six months after having insured it at treble its value, in four offices, whose directors were foolish enough to pay the money without making sufficient inquiry.'

A stifled groan escaped from M. Calfat's lips as he covered his face with his hands.

'Who are you that you thus dare to constitute yourself our judge?' asked another, looking fiercely at Vernor.

'Who am I, Monsieur Pérou? simply one who can appreciate your very rare dexterity in holding court-cards in your hand, and making the dice turn up as you please.'

M. Pérou gave an involuntary start, and thenceforward held his peace. The scene, aided by the darkness of approaching night, had now assumed a terrific aspect. The voice of the major rang in the ears of eleven pale, trembling men, with a cold metallic distinctness, as if each word inflicted a blow.

At length Vernor burst into a strange sharp hissing laugh. 'Well, my honourable colleagues,' he exclaimed, 'does this poor Pierre Granger still appear to you unworthy of the slightest pity? I grant you he has committed a fault, and a fault which you would not have committed in his place. He has not had your cleverness in masking his turpitude with a show of virtue: that was his real crime. Now, if after having killed his wife, he had paid handsomely for masses to be said for her repose—if he had purchased a burial-ground, and caused to be raised to her memory a beautiful square white marble monument, with a flowery epitaph on it in gold letters—why, then, we should all have shed tears of sympathy, and eulogised Pierre Granger as the model of a tender husband. Don't you agree with me, Monsieur Norbec?'

M. Norbec started as if he had received an electric shock. 'It is false!' he murmured. 'I did not poison Eliza: she died of pulmonary consumption.'

'True,' said the major; 'you remind me of a circumstance which I had nearly forgotten. Madame Norbec, who possessed a large fortune in her own right, died without issue, five months after she had made you her sole legatee.' Then the major was silent. They were now in total darkness, and the throbbing of many agitated hearts might be heard in the room. Suddenly came the sharp click of a pistol, and the obscurity was for a moment brightened by a flash; but there was no report—the weapon had missed fire. The major burst into a long and loud fit of laughter. 'Charming! delightful! Ah, my dear sir,' he exclaimed, addressing the foreman, 'you were the only honest man of the

party, and see how, to oblige me, you have made an attempt on my person, which places you on an honourable level with Pierre Granger!' Then having rung the bell, he called for candles, and when they were brought, he said: 'Come, gentlemen, I suppose you don't want to sleep here; let us make haste, and finish our business.'

Ten minutes afterwards, the foreman handed in the issue paper—a verdict of not guilty; and Pierre Granger was discharged amid the hisses and execrations of the crowd, who, indeed, were prevented only by a strong military force from assaulting both judge and jury. Major Vernor coolly walked up to the dock, and passing his arm under that of Pierre Granger, went out with him through a side-door.

From that hour neither the one nor the other was ever seen again in the country. That night there was a terrific thunder-storm; the ripe harvest was beaten down by hailstones as large as pigeons' eggs, and a flash of lightning striking the steeple of the old ivy-covered church, tore down its gilded cross.

This strange story was related to me one day last year by a convict in the infirmary of the prison at Toulon. I have given it verbatim from his lips; and as I was leaving the building, the sergeant who accompanied me said: 'So, sir, you have been listening to the wonderful rhodomontades of Number 19,788?'

'What do you mean?—This history?—'

'Is false from beginning to end. Number 19,788 is an atrocious criminal, who was sent to the galleys for life, and who, during the last few months, has given evident proofs of mental alienation. His monomania consists chiefly in telling stories to prove that all judges and jurors are rogues and villains. He was himself found guilty, by a most respectable and upright jury, of having robbed and tried to murder Major Vernor. He is now about to be placed in a lunatic asylum, so that you will probably be the last visitor who will hear his curious inventions.'

'And who is Major Vernor?'

'A brave old half-pay officer, who has lived at Toulon, beloved and respected, during the last twelve years. You will probably see him to-day, smoking his Havannah cigar, after the table-d'hôte dinner, at the Crown Hotel.'

#### A DAY ON THE WHITADER.

A MORN of May—a valley on the south skirts of the Lammermuirs, in Berwickshire—two companions, one of them a country gentleman and my host, the other a friendly follower of science from the neighbouring town—the object of the party to have a ramble along the banks of the Whitader, and so on to the summit of Cockburn Law, a few miles distant. Such are the simple elements of the opening of my Day—a snatch of relaxation in the midst of busy city-life. The weather looks, on the whole, promising: at least, nobody is disposed to admit more than that 'there may be a shower—oh, of course—but nothing to speak of.' And some ladies are, by and by, to ride and to drive by a different way to meet us near the summit of the hill, though only on a strict promise from us gentlemen that there is to be no thunder. With the ladies are to come some solid comforts, to enable us to maintain existence till dinner-time.

At first, our course is over shingly *haughs* (plains skirting a river are so called in the north), memorials of havoc committed by the stream in the days of a late proprietor of the district, who, an old bachelor, used to say: 'Other men have wives to keep them in constant trouble through life; I have a water!' And most valiant was the fight he kept up through many years

with this pestilent stream; now hemming it in with a long embankment, like the Romans walling out the Picts; at another time, attempting to give it a more direct checkmate, by building jetties of piles and blocks half-way across its channel; of all of which structures it was sure to make ducks and drakes the first flood or *spate* next winter. A most troublesome set of neighbours are those mountain-streams, and so hypocritical too! You see, on a summer day, a tiny rill creeping among the pebbles, looking as if butter would not melt in its mouth; and yet this is the same entity which will come sweeping down at another time, a raging torrent, carrying off hay and corn, and sheep and cattle, cradles and old wives, and covering whole acre-breadths of rich land with stones and rubbish.

I wonder that men do not more readily see in such valleys as that I was threading, the record of an enormous space of time. It is of a very common form—namely, a trench cut by the water in a sandstone district. The walls, which everywhere rise up steeply on one side or the other, are sections of that kind of rock, from forty to eighty feet high, the space between varying from a quarter of a mile to half a mile wide. All the hollow is the work of the water. If we consider that it only works on those rare occasions of very high flood when it reaches these cliffs, and then makes an impression imperceptibly small, we must see that the time required for the whole operation must be truly vast—something in comparison with which the whole reach of our historical ages is but a mere trifle. And yet the time so chronicled is only one of many such spaces. Verily, it is a very old world this we live in!

It is the festival-day of the Ellem-ford Angling Club, and many of the members are to be seen wading in the stream in pursuit of their amusement. It is an unsocial amusement at all times; but even anglers lose reserve under the influence of success. We remark them to-day to be generally unconvivial, from which we become very sure that the trout are not taking well. In fact, the long continuance of dry weather—a whole April without a shower—has put the water into a bad state; and, besides, there is a blue sky, a hot sun, and no wind. None but simple fish will bite. Tam Hamilton himself would be at his wits' end on such a day. We feel a sly satisfaction, under these circumstances, in reflecting that the fish we seek for are not forbidden to us by any such accidents. And just now, we are passing under a cliff of the Old Red Sandstone formation, where the water leaves scarcely room for a rough path, strewn with fallen blocks; and, behold! in some of these masses are curious markings, which our scientific associate points out as scales of the *Androytychii*—fishes of the earliest type of their class, which lived when as yet there were no higher animals in the sea, and no land-animals of any kind at all. What a different fishing was this from that of the wading gentlemen aforesaid—and how little did they in general reflect, as they stumbled over these stones, what a rich mine of ideas lies entombed in them! This was the first spot in the south of Scotland where Devonian fossils, as they are comprehensively called, were found. The place is also interesting from what has happened to it in the *dynamics* of geology. It presents between the carboniferous formation of the lower part of the valley and the Silurian rocks of the neighbouring hill, a band of the Old Red, which has undergone a tremendous movement, there being a great *fault* between it and the former rocks, marked by a dense vein of trap. On the other hand, there is a spot where the upturned edges of the Silurian or grawacke rocks are seen in the bed of the stream, with patches of the Old Red upon them at a different angle, the remains of first deposits of the next formation, shewing how a change of inclination had taken place in the elder before the next in order were laid down. A junction at Siccar Point on the coast is classed as a the greet never i

in the science, from the remarks made upon it long ago by Hutton and Playfair.

Pass we on along the water-side—here enjoying the sparkle and rustle of the stream as it trots down a declivity, there speculating on the depth of a black pool which ever wheels round and round, with its burden of sticks and foam, emblem of a stupid, unprogressive mind: skirting fertile haughs, threading our way through rough plantings: here a sporting cottage smiles down from the top of the cliff, there a comfortable mill blocks up a narrow place in the valley: always the brown Lammermuirs onward. It is too soon for tree blossoms, almost for leaves; but to make up for this, constellations of primroses rise along the steep green forest-banks—something spontaneous and over and above—handed to us like a gift by Nature. And it is Scottish nature, for these green bushy steeps, with the primroses, are characteristic of our northern land. The birds keep up a continual festival. Ever and anon some curious feature in the crust of the earth turns up to view—as a trap or porphyry dyke crossing through the bed of the stream, rough and prominent there, but meet to the general surface on the country beyond the valley; or a strange flexure of the sandstone strata, a result of some laterally applied forces when all was soft and pliant. When geologists speculate on the causes of the form of the surface, where we see all the roughnesses and inequalities which *must* have once existed, reduced to one flowing smooth outline, they usually speak of *denudation*, or a cutting away of the surface, *by water*. But, behold! here is water cutting what it can in the channel of the stream; and the various masses are left more or less prominent and rough in proportion to their hardness or powers of resistance. The cause is manifestly inadequate to the effect, and another must be looked for. It is to be found in ice, which, in the glacier form, acts with so much more force and sharpness than water. One of our party was a valiant supporter of this assumed cause, and was continually pointing to the boulder clay immediately over the rocks at the summits of the cliffs, as the rubbish left by his glacial agent. *Non nostrum est*, however. We by and by reach the base of Cockburn Law, and commence an ascent of about 600 feet to the top, this eminence being between 1000 and 1100 feet above the sea in all. It is a tough pull of half an hour, and no one finds any fault with another when he turns round and calls admiration to the scenery of the Merse, and traces the Cheviots in the hazy distance to the south.

Attaining the top at length, we are repaid for our trouble by an immensely wide prospect in all directions: to the north, an indefinite series of the flat heathy hills of Lammermuir; to the south, the whole plain of the Tweed, from Eildon's tops, near Melrose, to the sail-studded sea at Berwick. The Law being, notwithstanding its small elevation, a conspicuous hill, has been early selected as a post of security and defence, and we still find remains of ancient circumvallations round the summit. Such is the condition of nearly all conspicuous hill-summits in the inhabited parts of Scotland, leading the mind to a time when the people must have been in a state of great simplicity and barbarism—harbouring in these rude fortifications against their Roman or Scandinavian invaders, as the Caffres did lately in their kloofs against the British. What a change to the time when we see the adjacent plain the seat of a large, industrious, and comfortable population! The tradition of the district is, that the unfortunate Picts, whose kingdom was suppressed in the ninth century, made their last stand in the fortified summit of Cockburn Law. The common people remark that, in consequence of having thus been so long occupied a thousand years ago, the top of the Law is to this day greener than its sides; which certainly is a fact, however it may be accounted for. Near the top of the

hill we found the ladies and one or two gentlemen, with the materials of lunch; but just at this time a sponge-like cloud began to discharge itself upon us in a most provoking manner, sunshine evidently prevailing not above half a mile off. Patience, however, enabled us to overcome this difficulty, which wholly vanished ere long, and we then had our viands spread out on the heath. The usual jucundity of gipsying parties prevailed for a space, and then we set out for a spot about a mile off, where a most remarkable antiquarian curiosity is to be seen.

On a sloping platform on the north face of the hill, screened from the low country by intervening high ground, we see some rude heaps of stones surrounded by certain appearances of turfy walls; and on a near inspection we find these to be the remains of a considerable fortress. The central and principal object has been an annular or ring-shaped building, of about thirty yards diameter, the wall being from five to six in thickness, through which a narrow passage gives access to an interior court. It has been built of dry stones, large and small, adjusted so as to make tolerably good masonry of its kind. The original height is unknown: in the latter end of the last century, it was still seven or eight feet high; but now we can only with some difficulty trace the base of the wall amidst the rubbish. The most curious peculiarity was, that in the thickness of the wall were recesses entering laterally on each hand from the passage, as well as from three other openings from the inner court; thus eight recesses in all—being so many little chambers or cells in which human beings might have lived, although in a most comfortless state. It is worthy of note, that these little rooms were roofed by gradually contracting the walls towards the top, and laying a slab across, the arch not being then invented. To the east of this tower, as it might be called, are the bases of four lesser and weaker circular buildings, connected with each other by walls; and around the whole group extends, in an oval form, a double circumvallation with trenches.

The history of the building is totally unknown. The ordinary name is Eetin's Hald; though usually presented in books as Edin's Hall or Ha'. Antiquaries speculate on its having been a palace of Edwin, king of Northumbria in the seventh century—the same prince from whom Edinburgh is supposed (altogether gratuitously) to have taken its name. It is to be feared that here an obvious meaning of the name has been overlooked. The Etin, in old Scottish tradition, is a giant (from the Danish *Jetten*;) thus we hear in our early national literature, of the tale of the *Red Etin*.\* Sir David Lyndsay, in his *Dreme*, speaks of having amused the infancy of King James V. with 'tales of the Red Etin and Gyre-carling.' Considering that the people of Lammermuir have a fireside story representing Eetin's Hald as having been anciently the abode of a giant, who lived upon the cattle of his neighbours, and did not always respect their own persons—whose leap, too, they shew in a narrow part of the streamlet near by—it is rather strange that the name of the place has not been detected as meaning merely the *Giant's Hold*. We have no doubt whatever that the name is this and no more. It has been conferred by the peasantry after they had forgotten every fact of the actual history of the building, and had no similar buildings in use among themselves to keep them in right ideas regarding it; they consequently dreamed a history for it, as the stronghold of one of those savage beings, of enormous stature and strength, who figure in the fabulous annals of every imaginative people. We see here, however, additional proof of the very great antiquity of the structure.

In the southern districts of Scotland, Eetin's Hald is

\* See *Popular Rhymes of Scotland*, 3d. ed. p. 243.

quite a unique object; but in the extreme north, and in the Orkney and Zetland islands, there are other ancient fortalices of the same form and character, usually called duns or burghs, and attributed to the Picts. In *Cordiner's Antiquities* is given the ground-plan of one called *Dunalisluig*, on the Firth of Dornoch, in Ross-shire, precisely resembling Eetin's Hald, as far as its base is concerned, but having also a second story similarly chambered, which of course may have been the case with Eetin's Hald also, for anything we can tell. It is understood that the most entire of all the duns now standing is that of Moussa, on a small island in the Zetland group. As there are no such buildings in Scandinavia, it is considered as tolerably certain that they were the production of a people holding the north of Scotland before the invasions of the Northmen in the ninth and tenth centuries—in short, of the Celtic people, or Picts, for to them is the latter term now found applicable. When these Celts occupied the whole of Scotland, they would raise such buildings everywhere; but of all south of Inverness-shire, Eetin's Hald alone survives. It must therefore be deemed a great curiosity, and we cannot but recommend that measures should be taken to clear it of rubbish, and preserve all that remains with scrupulous care. Were the interior court trenched for a few feet, there would probably be found weapons of stone, flint and bone implements, and other relics of the primitive inhabitants.

But now the westerling sun, streaming down in powerful radiance upon some of the distant hills of Selkirkshire, admonishes us that we must hie to the good town of Dunse, in order to dice with the angling-club, for such is the fixed arrangement. Horses and the car help us to make out this point, and we reach Hownam's Inn just in time. We need scarcely add, in the paraphrastic phrase, that the evening was spent in the utmost hilarity.

I could not but reflect afterwards—trivial as was the occasion for the idea arising—how much benefit one may derive on an excursion like this from a certain preparedness of mind. Even with a very small amount of scientific knowledge—and I can pretend to no more—how much better off are you than in a state of entire ignorance. A person altogether unacquainted with geology and its kin science archaeology would have, on this occasion, lacked many enjoyments which, as it was, fell to my share. Nearly at every step along the valley, I had objects to gratify curiosity, to elevate and expand the view of the mind, to connect the immediate with the remote, and often to send the heart in grateful adoration to the source of all good. The very forms of the hills—the ground everywhere prominent in simple proportion to the hardness of its composition—led the imagination to a wondrous crisis in the history of the globe, when the temperature of Prince Regent's Inlet must have prevailed as far south as Vienna, and but a small part of the surface was fitted to be a theatre of life. Even when, turning from the distant silent ages of the geologist, we came to the early listless days of our own race, what a curious theme of meditation! The hill-fort, representing a state of society like that of Caffreland—the ring-castle, without mortar or the arch, speaking of a time when the people of our land were just advanced in arts and means about as much as the Peruvians when discovered by Pizarro; these objects, in contrast with the Britain of our own age, were calculated to awaken most interesting trains of reflection. Now, of all this the holiday excursion of the ignorant man gives nothing. Things are to him merely what their surface tells to his eye. He can but hear the birds sing and the waters tinkle; and, literally—

The primrose by the water's brim,  
A yellow primrose is to him,  
And it is nothing more!

## A LIVING PICTURE.

'Her children arise up and call her blessed: her husband also, and he praiseth her.'

No, I'll not say your name.—I have said it now—  
As you, mine—first in childish treble tuned,  
Up through a score of dear familiar years,  
Till baby-voices mock us. Time may come  
When your tall sons look down on our white hair,  
Smiling to hear us call each other thus,  
And, curious, ask about the old, old days,  
The marvellous days—days when we two were young.

How far off seems that time, and yet how near!  
Now, as I lie and watch you come and go  
With handfuls of spring greenery, in soft robe  
Just gifted, and brown curls that girl-like fall,  
And straw-hat flapping in the April wind—  
I could forget these many years—start up,  
Crying: 'Come, let's go play!'

Well-a-day, friend,

Our playing is all done!

Still, let us smile;  
For as you flit about with these same flowers,  
You look like a spring morning, thrilled with light,  
And on your lips a bright invisible bird  
Sits, singing its gay heart out in old tunes;  
While, an embodied music, moves your step,  
Your free, wild, springy step, like corn in the wind.  
Gazing on you, I see young Atala,  
Or Pocahontas, noble child o' the sun,  
Or Lady Geraldine, her 'Courtship' o'er,  
Moves through the dark abeles.

But I'll not prate:  
Fair seemeth fairest, ignorant 'tis fair;  
That light incredulous laugh is worth a world!  
That laugh—with soft child-echoes—

Nay then, fade,  
Vague dream! Come, true and pure reality:  
Come, dewy dawn of wifehood, motherhood,  
Broadening to golden day. Come, silent round  
Of simple joys, sweet duties, happy cares,  
When each full hour drops bliss with liberal hand,  
Yet leaves to-morrow richer than to-day.

Will you sit here? The grass is summer warm;  
Look, how those children love the daisy-stars;  
So did we too, do you mind? That eldest lad,  
He has your very mouth. Yet, you will have't,  
His eyes are like his father's? Well; even so!  
They could not be more dark, and deep, and kind.

Do you know, this hour I have been fancying you  
A poet's dream, and almost sighed to think  
There was no poet to praise you—

Why, you're flown  
After those wild elves in the flower-beds there!  
Ha, ha! you're human now.

So best—so best:  
Mine eyelids drop, content, o'er moistened eyes—  
I would not have you other than you are.

## A SPIDER'S WEB.

On stepping out of the house, my attention was attracted by a spider's web covering the whole of a large lemon-tree nearly. The tree was oval, and well shaped; and the web was thrown over it in the most artistic manner, and with the finest effect. Broad flat cords were stretched out, like the cords of a tent, from its circumference to the neighbouring bushes; and it looked as if some genius of the lamp, at the command of its master, had exhausted taste and skill to cover with this delicate drapery the rich-looking fruit beneath. I think the spider would have measured full ten yards in diameter.—*Hernando, Valley of the Amazon.*

## THE DRUNKARD'S BIBLE.

BY MRS A. C. HALL.

'THERE is more money made in the public line than in any other, unless it be pawn-broking,' said Martha Hownley to her brother; 'and I do not see why you should feel uncomfortable; you are a sober man: since I have kept your house, I never remember seeing you beside yourself; indeed, I know that weeks pass without your touching beer, much less wine or spirits. If you did not sell them, somebody else would. And were you to leave "the Grapes" to-morrow, it might be taken by those who would not have your scruples. All the gentry say your house is the best conducted in the parish.'—

'I wish I really deserved the compliment,' interrupted Mathew, looking up from his day-book. 'I ought not to content myself with avoiding beer, wine, and spirits; if I believe, as I do, that they are injurious alike to the character and health of man, I should, by every means in my power, lead others to avoid them.'

'But we must live, Mathew; and your good education would not keep you—we must live!'

'Yes, Martha, we must live! but not the lives of vampires,' and he turned rapidly over the accounts, noting and comparing, and seemingly absorbed in calculation.

Martha's eyes became enlarged by curiosity—the small low curiosity which has nothing in common with the noble spirit of inquiry. She believed her brother wise in most things; but in her heart of hearts she thought him foolish in worldly matters. Still, she was curious; and yielding to what is considered a feminine infirmity, she said: 'Mathew, what is vampires?'

Mathew made no reply; so Martha—who had been 'brought up to the bar' by her uncle, while her brother was dreaming over an unproductive farm—troubled as usual about 'much serving,' and troubling all within her sphere by worn-out and shrivelled-up anxieties, as much as by the necessary duties of active life—looked at Mathew as if speculating on his sanity. Could he be thinking of giving up his business, because of that which did not concern him!—but she would 'manage him.' It is strange how low and cunning persons do often manage higher and better natures than their own. 'Martha,' he called at last in a loud voice, 'I cannot give longer credit to Peter Croft.'

He thought he was one of your best customers: he is an excellent workman; his wife has much to do as a house-keeper; and I am sure he spends every penny he earns—such was Martha's answer.

'More!' replied Mathew—'more! Why, last

week the score was eighteen shillings—besides what he paid for.'

'He's an honourable man, Mathew,' persisted Martha. 'It is not long since he brought me six tea-spoons and a sugar-tongs, when I refused him brandy (he will have brandy). They must have belonged to his wife, for they had not P. C. on them, but E.—something; I forget what.'

Mathew waxed wroth. 'Have I not told you,' he said—'have I not told you that we must be content with the flesh and blood, without the bones and marrow of these poor drunkards? I am not a pawn-broker to lend money upon a man's ruin. I sell, to be sure, what leads to it, but that is his fault, not mine.'

'You said just now it was yours,' said his sister sulkily.

'Is it a devil or an angel that prompts your words, Martha?' exclaimed Mathew impatiently; then leaning his pale, thoughtful brow on his clasped hands, he added: 'But, however much I sometimes try to get rid of them, it must be for my good to see facts as they are.'

Martha would talk: she looked upon a last word as a victory. 'He must have sold them whether or not, as he has done all his little household comforts, to pay for what he has honestly drunk; and I might as well have them as any one else. My money paid for them, and in the course of the evening went into your till. It's very hard if, with all my labour, I can't turn an honest penny in a bargain sometimes, without being chid, as if I were a baby.'

'I am sorely beset,' murmured Mathew, closing the book with hasty violence—'sorely beset; the gain on one side, the sin on the other; and she goads me, and puts things in the worst light: never was man so beset,' he repeated helplessly; and he said truly he was 'beset'—by *infirmity of purpose*, that mean, feeble, pitiful frustrator of so many good and glorious intentions.

It is at once a blessed and a wonderful thing how the little grain of 'good seed' will spring up and increase—if the soil be at all productive, how it will fructify! A great stone may be placed right over it, and yet the shoot will forth—*sideways*, perhaps, after a long, noiseless struggle amid the weight of earth—a white, slender thing, like a bit of thread that falls from the clipping scissors of a little heedless maid—creeps up, twists itself round the stone, a little, pale, meek thing, *tending upwards*—becoming a delicate green in the wooing sunlight—strengthening in the morning, when birds are singing—at mid-day, when man is toiling—at night, while men are sleeping, *until it pushes away the stone*, and overshadows its inauspicious birthplace with strength and beauty!

Yes! where good seed has been sown, there is always hope that, one day or other, it will, despite snares and pitfalls, despite scorn and bitterness, despite evil report, despite temptations, despite those wearying backslidings which give the wicked and the idle scoffers ground for rejoicing—sooner or later it will fructify!

All homage to the good seed!—all homage to the good sower!

And who sowed the good seed in the heart of Mathew Hownley? Truly, it would be hard to tell. Perhaps some sower intent on doing his Master's business—perhaps some hand unconscious of the wealth it dropped—perhaps a young child, brimful of love, and faith, and trust in the bright world around—perhaps some gentle woman, whose knowledge was an inspiration rather than an acquirement—perhaps a bold, true preacher of THE WORD, stripping the sinner of the robe that covered his deformity, and holding up his cherished sins as warnings to the world; perhaps it was one of Watts's hymns, learned at his nurse's knee (for Mathew and Martha had endured the unsympathising neglect of a motherless childhood), a little line, never to be forgotten—a whisper, soft, low, enduring—a comfort in trouble, a stronghold in danger, a refuge from despair. O what a world's wealth is there in a simple line of childhood's poetry! Martha herself often quoted the *Busy Bee*; but her bee had no wings; it could muck in the wax, but not fly for the honey. As to Mathew, wherever the seed had come from, there, at all events, it was, struggling but existing—biding its time to burst forth, to bud, and to blossom, and to bear fruit!

The exposure concerning the spoons and sugar-tongs made Mathew so angry, that Martha wished she had never had anything to do with them; but instead of avoiding the fault, she simply resolved in her own mind never again to let Mathew know any of her little transactions in the way of buying or barter—that was all!

Mathew, all that day, continued more thoughtful and silent than usual, which his sister considered a bad sign: he was reserved to his customers—nay, worse—he told a woman she should not give gin to her infant at his bar, and positively refused, the following Sunday, to open his house at all. Martha asked him if he was mad. He replied: 'No;' he was 'regaining his senses.' Then Martha thought it best to let him alone—he had been 'worse'—that is, according to her reading of the word, 'worse' before—taken the 'dumps' in the same way, but recovered, and gone back to his business 'like a man.'

Peter Croft, unable to pay up his score, managed, nevertheless, to pay for what he drank. For a whole week, Martha would not listen to his proposals for payment 'in kind;' even his wife's last shawl could not tempt her, though Martha confessed it was a beauty, and what possible use could Mrs Peter have for it now? it was so out of character with her destitution. She heard no more of it, so probably the wretched husband disposed of it elsewhere: this disappointed her. She missed as well have had it; she would not be such a fool again; Mathew was so seldom in the bar, that he could not know what she did!—Time passed on, Martha thought she saw one or two symptoms of what she considered amendment in her brother. 'Of course,' she argued, 'he will come to himself in due time.'

In the twilight which followed that day, Peter Croft, pale, bent, and dirty, the drunkard's redness in his eyes,

the drunkard's fever on his lips, tapped at the door of the room off the bar, which was more particularly Martha's room—it was in fact her watch-tower—the door half glazed, and the green curtain about an inch from the middle division; over this, the sharp observant woman might see whatever occurred, and no one could go in or out without her knowledge.

She did not say, 'Come in,' at once; she longed to know what new temptation he had brought her, for she felt assured he had neither money nor credit left.

And yet she feared—'Mathew made such a worry out of every little thing.' The next time he tapped at the window of the door, her eyes met his over the curtain, and then she said, 'Come in,' in a penetrating sharp voice, which was anything but an invitation.

'I have brought you something now, Miss Hownley, that I know you won't refuse to lend me a trifle on,' said the ruined tradesman; 'I am sure you won't refuse, Miss Hownley. Bad as I want the money, I could not take it to a pawn-broker; and if the woman asks for it, I can say I lent it, Miss Hownley—you know I can say that.'

Peter Croft laid a BIBLE on the table, and folding back the pages with his trembling fingers, shewed that it was abundantly illustrated by fine engravings. Martha loved 'pictures;' she had taken to pieces a *Pilgrim's Progress*, and varying the devotional engravings it had contained with abundant cuttings out from illustrated newspapers, and a few coloured caricatures, had covered one side of a screen, which, when finished, she considered would be at once the comfort and amusement of her old age. After the drunkard had partially exhibited its contents, he stood by with stolid indifference, while she measured the engravings with her eye, looking ever and anon towards the screen. 'Very well,' she said, uttering a deliberate untruth with her lips, while her mind was made up what to do—'very well; what did you say you wanted for it?' He repeated the sum: she took out exactly half, and laid the shining temptation on the table before him.

'Have you the heart, Miss Hownley,' he said, while fingering, rather than counting the money—'have you the heart to offer me such a little for such a great deal?'

'If you have the heart to sell it, I may have the heart to offer such a price,' she answered with a light laugh; 'and it is only a DRUNKARD'S BIBLE.'

Peter Croft dashed the money from him with a bitter oath.

'Oh, very well,' she said; 'take it—or leave it.' She resumed her work.

The only purpose to which a drunkard is firm, is to his own ruin. Peter went to the door, returned, took up the money—'Another shilling, miss? it will be in the till again before morning.'

Martha gave him the other shilling; and after he was fairly out of the room, grappled the book, commenced looking at the pictures in right earnest, and congratulated herself on her good bargain. In due time, the house was cleared, and she went to bed, placing the Bible on the top of her table, amongst a miscellaneous collection of worn-out dusters and tattered glass-cloths 'waiting to be mended.'

That night the master of 'the Grapes' could not sleep; more than once he fancied he smelt fire; and after going into the unoccupied rooms, and peeping through the keyholes and under the doors of those

that were occupied, he descended to the bar, and finally entering the little bar-parlour, took his day-book from a shelf, and placing the candle, sat down, listlessly turning over its leaves, but the top of the table would not shut, and raising it to remove the obstruction, Mathew saw a large family BIBLE; pushing away the day-book, he opened the sacred volume.

It opened at the 23d chapter of Proverbs, and, as if guided by a sacred light, his eyes fell upon the 29th verse, and he read:

'Who hath woe? who hath sorrow? who hath contentions? who hath babbling? who hath wounds without cause? who hath redness of eyes?

'They that tarry long at the wine; they that go to seek mixed wine.

'Look not thou upon the wine when it is red, when it giveth its colour in the cup, when it moveth itself aright.

'At the last it biteth like a serpent, and stingeth like an adder!'

He dashed over the leaves in fierce displeasure, and, as if of themselves, they folded back at the 5th of Galatians: 'Envyings, murders, drunkenness, revellings, and such like: of the which I tell you before, as I have also told you in time past, that they which do such things shall NOT INHERIT THE KINGDOM OF GOD.'

'New and Old, New and Old,' murmured Mathew to himself—'I am condemned alike by the Old and the New Testament.' He had regarded intoxication and its consequences heretofore as a great social evil; the fluttering rage and the fleshless bones of the drunkard and his family, the broils, the contentions, the ill-feeling, the violence, the murders wrought by the dread spirit of alcohol, had stood in array before him as social crimes, as social dangers; but he did not call to mind, if he really knew, that the Word of God exposed alike its destruction and its sinfulness. He was one of the many who, however good and moral in themselves, shut their ears against the voice of the charmer, charm he ever so wisely; and though he often found wisdom and consolation in a line of Watts's hymns, he rarely went to the Fountain of living waters for the strengthening and refreshing of his soul. He turned over the chapter, and found on the next page a collection of texts, written upon a strip of paper in the careful hand of one to whom writing was evidently not a frequent occupation.

Proverbs the 23d chap.—'For the drunkard and the glutton shall come to poverty, and drowsiness shall clothe a man with rags.' 1 Corinthians, 6th chap. 10th verse—'Nor thieves, nor covetous, nor drunkards, nor revilers, nor extortioners, shall inherit the kingdom of God.'

'Again that awful threat!' murmured Mathew; 'and have I been the means of bringing so many of my fellow-creatures under its ban?'

I Samuel, the 1st chap.—'And Eli said unto her, How long wilt thou be drunken? put away thy wine from thee.' Luke 21—'And take heed to yourselves, lest at any time your hearts be overcharged with surfeiting, and drunkenness, and cares of this life, and so that day come upon you unawares.'

'Ay, THAT DAY,' repeated the landlord—'that day, the day that must come.'

Ephesians, 5th chap.—'And be not drunk with wine, wherein is excess; but be filled with the Spirit.' Proverbs, 20th chap.—'Wine is a mocker, strong drink is raging, and whosoever is deceived thereby is not wise.' 'Woe to thee who selleth wine to thy neighbour, and minglenth strong drink to his destruction.'

He rose from the table, and paced up and down the little room; no eye but His who seeth all things looked upon the earnestness and agitation of that man; no ear but the All-hearing heard his sighs, his half-muttered prayers to be strengthened for good. He said within himself: 'Who will counsel me in this matter?—to

whom shall I fly for sympathy?—who will tell me what I ought to do?—how remedy the evils I have brought on others while in this business, even when my heart was alive to its wickedness?' He had no friend to advise with—none who would do aught but laugh at and ridicule the idea of giving up a good business for conscience' sake; but so it was that it occurred to him—'You have an Immortal Friend, take counsel of Him—pray to Him—learn of Him—trust Him; make His Book your guide;' and opening the Bible he read one other passage. 'Keep innocency, and take heed to the thing that is right, for that shall bring a man peace at the last.'

Pondering on this blessed rule of life, so simple and so comprehensive, he turned back the pages, repeating it over and over again, until he came to the first fly-leaf, wherein were written the births, marriages, and deaths of the humble family to whom the Bible had belonged; and therein, second on the list, he saw in a stiff, half-printed hand, the name—EMMA HANBY, only daughter of James and Mary-Jane Hanby, born so-and-so, married at such a date to PETER CROFT!

'Emma Hanby'—born in his native village; the little Emma Hanby whom he had loved to carry over the brook to school—by whose side in boy-love he had sat in the meadows—for whom he had gathered flowers—whose milk-pail he had so often lifted over the church-stile—whom he had loved as he never could or did love woman since—whom he would have married, if she, light-hearted girl that she was, could have loved the tall, yellow, awkward youth whom it was her pastime to laugh at, and her delight to call 'Daddy'—was she then the wife—the torn, soiled, tattered, worn-out, insulted, broken-spirited wife of the drunkard Peter Croft! It seemed impossible; her memory had been such a sunbeam from boyhood up; the refiner of his nature—the dream that often came to him by day and night. While passing the parochial school, when the full tide of girls rushed from its heat into the thick city air, his heart had often beat if the ringing laugh of a merry child sounded like the laugh he once thought music; and he would watch to see if the girl resembled the voice that recalled his early love.

'And I have helped to bring her to this,' he repeated over and over to himself; 'even I have done this—this has been my doing.' He might have consoled himself by the argument, that if Peter Croft had not drunk at 'the Grapes,' he would have drunk somewhere else; but his seared conscience neither admitted nor sought an excuse; and after an hour or more of earnest prayer, with sealed lips, but a soul bowed down, at one moment by contempt for his infirmity of purpose, and at another elevated by strong resolves of great sacrifice, Mathew, carrying with him the *Drunkard's Bible*, sought his bed. He slept the feverish, unrefreshing sleep which so frequently succeeds strong emotion. He saw troops of drunkards—blear-eyed, trembling, ghastly spectres, pointing at him with their shaking fingers, while, with pestilential breath, they demanded 'who had sold them poison.' Women, too—drunkards, or drunkards' wives—in either case, starved, wretched creatures, with scores of ghastly children, hooted him as he passed through caverns reeking of gin, and hot with the steam of all poisonous drinks! He awoke just as the dawn was crowning the hills of his childhood with glory, and while its munificent beams were penetrating the thick atmosphere which hung as a veil before his bedroom window.

To Mathew the sunbeams came like heavenly messengers, winging their way through the darkness and chaos of the world for the world's light and life. He had never thought of that before; but he thought of and felt it then, and much good it did him, strengthening his good intent. A positive flood of light poured in through a pane of glass which had been cleaned the previous morning, and played upon the cover of the

poor Drunkard's Bible. Mathew bent his knees to the ground, his heart full of emotions—the emotions of his early and better nature—and he bowed his head upon his hands, and prayed in honest resolve and earnest zeal. The burden of that prayer, which escaped from between his lips in murmurs sweet as the murmurs of living waters, was—that God would have mercy upon him, and keep him in the right path, and make him, unworthy as he was, the means of grace to others—to be God's instrument for good to his fellow-creatures; to minister to the prosperity, the regeneration of his own kind. Oh, if God would but mend the broken vessel, if he would but heal the bruised reed, if he would but receive him into his flock! Oh, how often he repeated: 'God give me strength! Lord strengthen me!'

And he arose, as all arise after steadfast prayer—strengthened—and prepared to set about his work. I now quote his own account of what followed.

'I had,' he said, 'fixed in my mind the duty I was called upon to perform; I saw it bright before me. It was now clear to me, whether I turned to the right or to the left; there it was, written in letters of light. I went down stairs, I unlocked the street-door, I brought a ladder from the back of my house to the front, and with my own hands, in the gray, soft haze of morning, I tore down the sign of my disloyalty to a good cause. "The Grapes" lay in the kennel, and my first triumph was achieved. I then descended to my cellar, locked myself in, turned all the taps, and broke the bottles into the torrents of pale ale and brown stout which foamed around me. Never once did my determination even waver. I vowed to devote the remainder of my life to the destruction of alcohol, and to give my power and my means to reclaim and succour those who had wasted their substance and debased their characters beneath my roof. I felt as a freed man, from whom fetters have been suddenly struck off; a sense of manly independence thrilled through my frame. Through the black and reeking arch of the beer-vault, I looked up to Heaven; I asked God again and again for the strength of purpose and perseverance which I had hitherto wanted all my latter life. While called a "respectable man," and an "honest publican," I *knew* that I was acting a falsehood, and dealing in the moral—perhaps the eternal—deaths of many of those careless drinkers, who had "sorrow and torment, and quarrels and wounds without cause," even while I, who sold the incentives to sorrow and torment, and quarrels and wounds without cause, knew that they "bit like serpents and stung like adders." What a knave I had been! erecting a temple to my own respectability on the ruins of respectability in my fellow-creatures! talking of honesty, when I was inducing sinners to augment their sin by every temptation that the fragrant rum, the white-faced gin, the brown bouncing brandy, could offer—all adulterated, all untrue as myself, all made even worse than their original natures by downright and positive fraud; talking of honesty, as if I had been honest; going to church, as if I were a practical Christian, and passing by those I had helped to make sinners with contempt upon my lip, and a "Stand by, I am holier than thou!" in my proud heart, even at the time I was inducing men to become accessories to their own shame and sin, and the ruin of their families.

'Bitter, but happy tears of penitence gushed from my eyes as the ocean of intoxicating and baneful drinks swelled, and rolled, and seethed around me. I opened the drain, and they rushed forth to add to the impurity of the Thames. "Away they go!" I said; "their power is past; they will never more turn the staggering workman into the streets, or nerve his arm to strike down the wife or child he is bound by the law of God and man to protect; never more send the self-inflicted fever of *delirium-tremens* through the

swelling veins; never drag the last shilling from the drunkard's hand; never more quench the fire on the cottage hearth, or send the pale, overworked artisan's children to a supperless bed; never more blister the lips of woman, or poison the blood of childhood; never again inflict the Saturday's headache, which induced the prayerless Sunday. Away—away! would that I had the power to so set adrift all the so perverted produce of the malt, the barley, and the grape of the world!" As my excitement subsided, I felt still more resolved; the more I calmed down, the firmer I became. I was as a paralytic recovering the use of his limbs; as a blind man restored to sight. The regrets and doubts that had so often disturbed my mind gathered themselves into a mighty power, not to be subdued by earthly motives or earthly reasoning. I felt the dignity of a mission; I would be a Temperance Missionary to the end of my days! I would seek out the worst amongst those who had frequented "the Grapes," and pour counsel and advice—the earnest counsel and the earnest advice of a purely disinterested man—into ears so long deaf to the voice of the charmer. I was a free man, no longer filling my purse with the purchase-money of sorrow, sin, and death. I owed the sinners, confirmed to lead the old life of sin in my house—I owed them atonement. But what did I not long to do for that poor Emma? When I thought of her—of her once cheerfulness, her once innocence, her once beauty—I could have cursed myself. Suddenly my sister shook the door. She entreated me to come forth, for some one had torn down our sign, and flung it in the kennel. When I shewed her the dripping taps and the broken bottles, she called me, and believed me mad; she never understood me, but less than ever then. I had, of course, more than one scene with her; and when I told her that, instead of ale, I should sell coffee, and substitute tea for brandy, she, like too many others, attaching an idea of feebleness and duplicity, and want of respectability to Temperance, resolved to find another home. We passed a stormy hour together, and amongst many things, she claimed the Drunkard's Bible; but that I would not part with.

'I lost no time in finding the dwelling of Peter Croft. Poor Emma! If I had met her in the broad sunshine of a June day, I should not have known her; if I had heard her speak, I should have recognised her voice among a thousand. Misery for her had done its worst. She upbraided me as I deserved. "You," she said, "and such as you, content with your own safety, never think of the safety of others. You take care to avoid the tarnish and wretchedness of drunkenness yourselves, while you entice others to sin. Moderation is your safeguard; but when did you think it a virtue in your customers?"

'I told her what I had done, that in future mine would be strictly a Temperance house; that I would by every means in my power undo the evil I had done.

"Will that," she answered in low, deep tones of anguish—"will that restore what I have lost?—will it restore my husband's character?—will it save him, even if converted, from self-reproach?—will it open the grave, and give me back the child, my first-born, who, delicate from its cradle, could not endure the want of heat and food, which the others have still to bear?—will it give us back the means squandered in your house?—will it efface the memory of the drunkard's songs, and the impurity of the drunkard's acts? O Mathew! that you should thrive and live, and grow rich and respectable, by what debased and debauched your fellow-creatures. Look!" she added, and her words pierced my heart—"look! had I my young days over again, I would rather—supposing that love had nothing to do with my choice—I would rather appear with my poor degraded husband, bad as he has been, and is, at the bar of God, than kneel there as your wife!" (You, cool-

headed and moderate by nature, knowing right from wrong, well educated, yet tempting, tempting others to the destruction which gave you food and plenshing—your fine *gin-palace*! your comfortable rooms! your intoxicating drinks! the pleasant company! all, all! willing the tradesman from his home, from his wife, from his children, and sending him back when the stars are fading in the daylight. Oh! to what a home! Oh! in what a state!

"I do think, as you stand there, Mathew Hownley, well dressed, and well fed, and respectable—yes, that is the word, '*respectable*!'—that you are, at this moment, in the eyes of the Almighty, a greater criminal than my poor husband, who is lying upon straw with madness in his brain, trembling in every limb, without even a *Bible* to tell him of the mercy which Christ's death procured for the penitent sinner at the eleventh hour!"

"I laid her own Bible before her. I did not ask her to spare me: every word was true—I deserved it all. I went forth; I sent coal, and food, and clothing into that wretched room; I sent a physician; I prayed by the bedside of Peter Croft, as if he had been a dear brother. I found him truly penitent; and with all the resolves for amendment which so often fade in the sunshine of health and strength, he wailed over his lost time, his lost means, his lost character—all lost; all God had given—health, strength, happiness, all gone—all but the love of his ill-used and neglected wife; that had never died! "And remember," she said to me, "there are hundreds, thousands of cases as sad as his in England, in the Christian land we live in! Strong drink fills our jails and hospitals with sin, with crime, with disease, with death; its mission is sin and sorrow to man, woman, and child; under the cloak of good-fellowship it draws men together, and the "good-fellowship" poisons heart and mind! Men become mad under its influence. Would any man not mad, squander his money, his character, and bring himself and all he is bound to cherish to the verge of the pauper's grave; nay, into it? Of five families in this wretched house, the mothers of three, and the fathers of four, never go to their ragged beds sober; yet they tell me good men, wise men, great men, refuse to promote temperance. Oh, they have never seen how the half-pint grows to the pint—the pint to the quart—the quart to the gallon! They have never watched for the drunkard's return, or experienced his neglect or ill-usage—never had the last penny for their children's bread turned into spirits—never woke to the knowledge, that though the snow of December be a foot on the ground, there is neither food nor fire to strengthen for the day's toil!"

"Poor Emma! she spoke like one inspired; and though her spirit was sustained neither by flesh nor blood, she seemed to find relief in words.

"When I spoke to her of the future with hope, she would not listen. "No," she said, "my hope for him and for myself is beyond the grave. He cannot rally; those fierce drinks have branded his vitals, burnt into them. Life is not for either of us. I wish his fate, and mine, could warn those around us; but the drunkard day after day sees the drunkard laid in his grave, and before the last earth is thrown upon the coffin, the quick is following the example set by the dead—of another, and another glass!"

"She was right. Peter's days were numbered; and when she knelt beside his coffin, she thanked God for his penitence, and offered up a prayer that she might be spared a little longer for her children's sake. That prayer gave me hope: she had not spoken then of hope except of that beyond the grave.

"My friends jested at my attention to the young widow, and perhaps I urged her too soon to become my wife. She turned away, with a feeling which I would not, if I could, express. Her heart was still with her

husband, and she found no rest until she was placed beside him in the crowded church-yard. The children live on—the son, with the unreasoning craving for strong drink which is so frequently the inheritance of the drunkard's child; the daughters, poor, weakly creatures—one, that little deformed girl who sits behind the tea-counter, and whose voice is so like her mother's; the other, a suffering creature, unable to leave her bed, and who occupies a little room at the top of what was "the Grapes." Her window looks out upon a number of flower-pots, whose green leaves and struggling blossoms are coated with blacks, but she thinks them the freshest and most beautiful in the world!"

#### ANCIENT ENGLAND.

WHILE dreaming over those dim and undated relics, the Welsh Triads, which allude to events that transpired in our island centuries before its silence was broken by the sound of the Roman trumpets, we have endeavoured to obtain a glimpse of England as it was in ancient times. These mysterious fragments lie like the wrecks of an old world on the shores of the sea of Time; and all we can see through the gray twilight of traditions handed down through a long line of bards that seem as shadowy as Banquo's kings, is the form of Prydian the son of Aedd, who came 'over the hazy ocean from the Country of Summer,' and who, according to these ancient Triads, when he first landed on our shores, 'found no man alive, nor anything but bears, wolves, beavers, and the oxen (bison) with the high prominence.' Further we read, that through the number of bees he found, he first called England 'the Island of Honey.' From this we know that there was a pleasant murmur among the flowers which grew in those wild and untrampled forests, long before the gray pillars of Stonehenge—those bleached bones of this old world—stood in the primeval solitude where they still sleep; and Prydian, or Briton, from whom our island is supposed to have been named, may, after all, be but the dream of some forgotten British bard; or he may have been some old Cymric hunter, who, landing on a lonely part of the island, chased the maned bison and the gray wolf of the wold, and clothed himself in the skins of the beasts of the chase. Perchance he pitched his rude hut by some forest fastness that looked over the sea; and on some stormy day a rude chiuie, or boat, hollowed from the trunk of a gigantic tree—many of which have been found in the deep beds of our ancient rivers—might be blown upon the beach, and with it some British mother, whose young barbarians, on a future day, would hunt the cave-bear along that windy shore, and by their shouts drive the glossy beaver—that old builder—to his burrow.

The sunsets of those forgotten summers flashed not, as now, on walled cities and tall spires that point heavenward, as if to direct our thoughts to another home beyond the grave, but gilded the tops of tall trees—a land of forests—through the underwood of which the tusked boar rushed, and the shaggy bison bellowed; while high overhead the broad-winged eagle screamed. The foot of no friendly patrol passed with measured step, keeping watch around the wattled hut, or by the sandy cave in which these 'gray forefathers' of the forest slept; but the long howl of the gaunt wolf startled the silence of those forgotten midnights, as his footfall rustled among the fallen leaves, while he prowled round those primitive thresholds scenting out his prey. What are now the velvet valleys of green England, were

then, in the lower plains, leagues of silty marsh, and sinking morass, and inland meres—bordered with tufted rushes and sword-like water-flags; while between the black bulrushes—which at every breeze bowed to one another—the wild-swan sailed, arching her silver neck, and the dark water-hen clove the sunny ripples as she headed her dusky brood, undisturbed by either the voice or the footfall of man. The old rivers were then mastless, though sometimes the reeds by the margin were rocked as the ancient Cymry paddled by in his wicker-coracle, or left the print of his footsteps on the muddy shore as he carried his basket-boat on his back to some more distant river. Had Time hardened that footmark into a slab, such as bears the impress of the steps of extinct animals, it would have borne the mark of the thongs of raw hide which bound the soles—formed of the untanned skin of some beast of the chase—to his feet. We still find under the gray cairn, or green barrow that marks his grave, the hatchet of stone and arrow-head of flint which he used in war or the chase, long before his descendants drove those terrible chariots, with scythes projecting from the wheels, through Cæsar's cohorts, and scattered his Roman eagles. In subterranean chambers—under the floors of which even then, though unknown to him, reposed the remains of mammoth and hippopotami, the saw-toothed tiger, and many another extinct animal that, ages before he was born, roamed over this ancient island—he stored his corn, and kept in his wicker-basket the salt which he exchanged his tin for with the adventurous Phœnicians—those old voyagers, whose ships visited our shores centuries before the keel of a Roman galley had ever grated over the shingles that strew our wind-beaten beaches. When wearied with war or the chase, he threw himself down at night to rest on his couch of grass, dried leaves, or rushes, and covered his body—which was punctured with the forms of monsters and Druidical emblems—with the blue cloak or sagum, which he dyed with the same plant that he used for staining himself; or in winter weather with the skins of his own cattle, or those he had slain in the wild forests. His seat was a portion of the round stem of a tree; and out of the same material he formed rude trenchers and rugged bowls, and in the course of time made vessels of clay, which he baked in the sun. When he pastured his flocks and herds, or sowed his rude harvest in the open plains, near to another man's land, his boundary-line was marked by stones, such as were used by the Eastern patriarchs, and are mentioned in Scripture, where it is written: 'Cursed is he that removeth his neighbour's landmark.' But he knew nothing of the Bible nor of God; no gospel-trumpet had as yet shaken the old oaks, under which he worshipped his idols, with its sound; nor had the name of the Most High startled the bearded Druid from the heathen altar, where he offered up human sacrifices, in the gloomy groves of those wildering forests. Though long since gone, we can still picture him, through the eye of the imagination, wearing his flowing garments, which look whiter beside the dark foliage under which he stands, with the golden pruning-hook in his hand, ready to cut the pearly-berried mistletoe, which was held sacred in his pagan rites. Perchance that arch-Druid in his soul spurned the blinded believers who gathered around him, and bowed their slavish backs, making themselves stepping-stones, on which he planted his feet as he ascended the aged oak; and gathered closer the folds of his garments, as if he feared that they would become contaminated through touching those benighted worshippers he held in thrall. His power seemed to stretch beyond the grave; for he taught them to believe, that in the howling winds which went moaning and groaning through the dark midnights that settled down upon those dim and shadowy forests, they heard the voices of those departed spirits he had doomed to wander

through the wild air for evermore, for having, while living, rebelled against his cruel creed. With what awe and fear would they gaze on the fabulous egg which, cased with gold, he wore suspended from his neck! That egg, as they were taught to believe, was engendered by fiery serpents while they straggled together in the air, and was caught in its fall by a mounted horseman, who rode off with it at breathless speed, followed by the hissing and fiery reptiles, who would have devoured if they had overtaken him. The few fragments of the hymns he chanted that have been preserved, are to us a mystery. We know nothing about 'the cattle of the deep' to which they allude, nor 'the caldron that would not boil the food of a coward.' The gray oracle of Stonehenge to us is for ever dumb.

Two or three centuries pass away, and a great change has come over the face of this ancient England—there is a Roman stamp upon its features, and a classic look about its cities: it has improved under the hands of its conquerors; whichever way the eye is turned, there are signs of civilisation. Instead of watted and reedy huts standing by the spongy swamp or gloomy forest, we now find walled cities, and see stretching over the landscape long lines of road straight as an arrow, while corn waves on the uplands, and flocks and herds bleat and low from pastures knee-deep in summer grass. Fruit-trees throw their rich array of blossoms over the scene; and though their corn is taxed, their fruit tithed, and heavy levies laid on their cattle by the conquerors who have wrought this wonderful change—and though they have lost somewhat of their wild martial spirit, they are no longer the savage hunters, who, clad in skins, dwelt in caves and branch-woven huts; for now Roman arches span their streets, and Roman temples tower above their tessellated pavements. The wolf was now left to howl in the forest depths, where the old Druidical altar lay overthrown, and half buried in the underwood; for saving where the lonely homestead arose amid some far-off pasturage, he no longer prowled around the habitation of man. Instead of hewing out rude wooden bowls with his stone-headed hatchet, or burning hollow the trunk of some gigantic tree to form his boat, the Briton, under his Roman master, had learned to use the potter's wheel, and build his ship with ribs and planks, and had thrown aside his wicker-coracle covered with the black bull's hide. Here and there, he had also heard tidings of the Gospel from the Roman soldiers, and faint rumours of the Great Redeemer who, over the far-off seas, had been crucified on that cross, which was so soon to supplant the image of Mars, and rise high above the Roman temples erected to the goddess of Victory. A new and holier Spirit sat brooding over the waters that washed our island-shores, since Mona's Druid oaks were uprooted and her wretched priests dispersed. Still, there were barbaric hordes, who, like the sea, were ever pouring in, and washing away the traces of civilisation; and against these the mighty conquerors could erect no better barriers than leagues of heavy walls, and broad ramparts flanked with towers and battlements, on which their lonely sentinels kept weary watch over wild wolds and savage moorlands: sometimes marching from fort to fort when summoned by the red glare of the beacon-fire to attack the undaunted assailants—the only change in their monotonous duties. The old Cymry seemed more secure in their forest-fastnesses, to which no broad level road led, than in the walled cities and pillared streets which he now paraded, wearing his golden torques and displaying his Roman finery; and thereby tempting those rough warriors from the stormy north to struggle for the spoil, while his own grim old scythe-wheeled chariots lay rusting, rotting, and forgotten. He was so altered, that he seemed never to have belonged to the hardy race who, foot to foot, and shoulder to shoulder, disputed the

possession of this ancient island with the legions led on by Julius Cæsar, and left them at last but little more ground than what they were encamped upon. Strange mystery! as his mind expanded, and he became more refined, he was less able to combat with the barbaric hordes that overran his native land: as he laid aside his brutal power, and became more a man, he almost ceased to be a hero; and when his Roman conquerors left him, he sat wringing his hands and weeping like a child. The spirit of Cassibellanus and Caractacus had fled.

Their Roman masters had now work enough on their own hands, in their own country: they left the poor Britons hard bested, telling them, as if in mockery, that they were then free; but, as the author of *Waverley* says, 'their parting exhortation to them to stand in their own defence, and their affectation of having, by abandoning the island, restored them to freedom, were as cruel as it would be to restore a domesticated bird or animal to shift for itself, after having been from its birth fed and supplied by the hand of man.' But they did not give themselves up to despair all at once, nor sit with folded arms calmly resigned to whatever might befall; they made some little struggle to prop up the old roof-tree and defend the ancient hearth. Alas! all was useless; and they were at last compelled to beckon to the stormy warriors who hung about their coast; and then the Saxons landed on their island-shore, fought and defended them for a short time, and finally settled down and took possession, driving the old Cymry to rocky Cornwall and mountainous Wales.

A new race now stood upon the shores of this ancient England—a grim Gothic tribe, who worshipped Odin, and aspired to the brutal heaven of Valhalla, there to eat of that fabulous boar whose flesh never diminished, and drink mead out of the skulls of their enemies. Those who fell not in the red ranks of battle, dwelt for ever, after death, with Hela the terrible, in the Hall of Cowards; and the only prayers they offered up were, that they might die in the combat, and so pass at once, while their wounds were still fresh, to the halls of their heathen heaven. The howling of the storm and the roaring of the waves were to their ears pleasant music—for they sprang from the same race as those brave old Sea-kings who followed in their wake, and for many a long and after-year contended for the possession of the island-home which Hengist and Horsa had won. After this period, we have the light of history to guide us, and no longer grope blindly through the old twilight of time along this shore strewn with the wrecks of an ancient world, and of which almost every trace of its early inhabitants is swept away. The few fragments that are left of their language, like the waves of the ancient ocean, have a mysterious murmur of their own, which we can never clearly understand; for the thoughts of these people were not our thoughts; nor beyond the few rude hints which we have thrown together, can their manners or customs ever be known. Under the cromlech or the cairn, or in the hollow cist hewn from some mighty tree, they lay down and took their long sleep, without a thought of posterity, or a care as to the conclusions after-ages might arrive at regarding the few rude monuments they left behind. We might as well ask the old sea that is working away fathoms below at new caves on the level beach, when it formed those so high over our heads, and hope to receive an answer, as ever expect to know who first owned the hatchet of stone and spear-head of flint which we find in those ancient graves, the old British barrows. Who first called England the Island of Honey—or named it the Country of Sea-cliffs—or sailed from that mysterious Land of Summer—or heard the first murmur of the bees in our savage and untrodden forests—we can never know. We look back through the ancient gates of Stonehenge, and know that in old-forgotten mornings busy builders were employed there; but who

they were, or from whence they came, they have left no record to tell; and while pausing for a reply, we seem to hear a solemn voice exclaim: 'Hitherto shalt thou come, but no further!'

### THE VALLEY OF THE AMAZON.

THE vast tract of country through which the great river Amazon flows, has recently attracted considerable attention both in Europe and America. Lieutenant Herndon's valuable book on this subject, just published, deserves the twofold praise of being opportune and really instructive.\* The mere fact of its being the account of an official mission to explore and report on the Valley of the Amazon, undertaken at the command of the United States' government, is a guarantee that the author has not written heedlessly, or set down crude first impressions, or mere conjecture as facts. As he speaks with the straightforwardness of authority and personal knowledge, we shall make his work the text-book of some of our observations on this magnificent region.

The origin of the name Amazon carries us back to Francisco Orellana, the first European navigator of the river. In his account of his perilous voyage, he does not omit a fine stock of marvels. Among them, he speaks of seeing bands of armed women along the banks of the river throughout a great tract of country; and concluding that they used as well as bore arms, he named the river, *the River of the Amazons*, and the country through which it flowed, *Amazonia*, which it long retained. His own name is also frequently applied to the river by old geographers; and the poets, who love justice of this kind, do not forget to call the river the Orellana. For instance, Thomson—

Swelled by a thousand streams impetuous hurled  
From all the roaring Andes, huge descends  
The mighty Orellana.

The Amazons seen by Orellana and his companions were, in reality, women with arms in their hands; but they carried these arms in their capacity of attendants upon their husbands, who were then, as their descendants still are, to all intents and purposes, the lords and masters of their wives. In no part of the world is the subjection of the woman to the man more complete than in the Valley of the Amazon; nor can any name be less appropriate than the common one given to the Orellana. Lieutenant Herndon, without moralising on the fact, bears sufficient witness to the contempt and indifference of the various tribes of Indians in this region towards their wives. He was surprised to see strong young men among them, whom he had engaged as boatmen, allow pretty, slender girls to carry all their necessary accoutrements, and even their oars or paddles for them, while they walked first in unencumbered dignity—nor returned so much as a word or look of gracious acknowledgment when the deferential slaves followed them on board and deposited their burdens. Idleness is the *summum bonum* with nearly all these tribes; hunting, fishing, and rowing are all their employments. The women are made to do all the other work, and a sorry life they must have of it. On the Ucayale, however—one of the Peruvian tributaries of the Amazon—he speaks of the Indian savages as more active and warlike than the other dwellers on its shores; and one tribe among them he speaks of from the report of the Spanish missionaries, and also from that of Mr Smyth, a well-known preceding traveller, which is somewhat astonishing in that world of lazy enjoyment.

These people are called Sencis; they cultivate the land in common, and are such appreciators of industry,

\* *Exploration of the Valley of the Amazon*. By Lieut. Wm. Lewis Herndon, U.S. Navy. With Map and Plates. Taylor and Maury, Washington; Trübner & Co., London.

that they *kill* all those who are idle or do not perform their fair share of work. They have attained to the social elevation so much admired, in theory, by one of our great living philosophers; and their Captains of Industry are not obliged to 'cut prejudice against the grain.'

In obedience to his orders, Lieutenant Herndon determined to explore as much as possible of the entire basin or water-shed drained by the Amazon and its tributaries. He therefore divided his party, taking the upper part and main stream himself, and sending his second in command, passed midshipman Lardner Gibbon, to explore the great southern tributary, the Madeira, and its chief branches. Enough is made known by the present work, to establish the fact that a commercial navigation of the Amazon from Pará to Nanta, and even higher, would be easy, and of the greatest advantage to Europe and North America, for a richer or more productive soil does not exist. Let Mr Herndon speak on this subject: 'This land is of unrivalled fertility: on account of its geographical situation, and topographical and geological formation, it produces nearly everything essential to the comfort and wellbeing of man. On the top and eastern slope of the Andes lie hid unimaginable quantities of silver, iron, coal, copper, and quicksilver, waiting but the application of science and the hand of industry for their development. The successful working of the quicksilver mines of Huancavelica, would add several millions of silver to the annual product of Cerro de Pasco alone. Many of the streams that dash from the summit of the Cordilleras, wash gold from the mountain-side, and deposit it in the hollows and gulches as they pass. Barley, quinna, and potatoes, best grown in a cold, with wheat, rye, maize, clover, and tobacco, products of a temperate region, deck the mountain-side and beautify the valley; while immense herds of sheep, llamas, alpacas, and vicuñas, feed upon those elevated plains, and yield wool of the finest and longest staple.'

'Descending towards the plain, and only for a few miles, the eye of the traveller from the temperate zone is held with wonder and delight by the beautiful and strange productions of the torrid. He sees, for the first time, the symmetrical coffee-bush, rich with its dark-green leaves, its pure white blossoms, and its gay red fruit. The prolific plantain, with its great waving fan-like leaf, and immense pendent branches of golden-looking fruit, enchains his attention. The sugar-cane waves in rank luxuriance before him; and if he be familiar with southern plantations, his heart swells with emotion as the gay, yellow blossom and white boll of the cotton sets before his mind's-eye the familiar scenes of home. Fruits, too, of the finest quality and most luscious flavour grow here—oranges, lemons, bananas, pine-apples, melons, chirimoyas, &c.'

'It is sad to recollect, that in this beautiful country—I have before me the valley of the Chanchamayo—men should have offered me title-deeds in gratuity to as much of this rich land as I wanted. Many of the inhabitants of Tarma hold grants of land in the Chanchamayo country from the government, but are so distrustful of its ability to protect them in their labours from the encroachments of the savages, that they do not cultivate them.'

'The country everywhere in Peru, at the eastern foot of the Andes, is such as I have described above. Further down, we find the productions of a country which is occasionally overflowed, and then subjected, with still occasional showers, to the influence of a tropical sun. From these causes, we see a fecundity of soil and a rapidity of vegetation that are marvellous, and to which even Egypt, the ancient granary of Europe, affords no parallel, because, though similar in some other respects, this country has the advantage of Egypt in that there is no drought. Here, trees evidently young, shoot up to such a height, that

no fowling-piece will reach the game seated on their topmost branches; and with such rapidity, that the roots have not strength or sufficient hold upon the soil to support their weight; and they are continually falling, borne down by the slightest breeze, or by the mass of parasites and creepers that envelop them from root to top.

'This is the country of rice, of sarsaparilla, of India-rubber, balsam copaiba, gum-copal, animal and vegetable wax, cocoa, Brazilian nutmeg, Tonka-beans, ginger, black-pepper, arrow-root, tapioca annatto, indigo, sapacaia, and Brazil-nuts; dyes of the gayest colours, drugs of rare virtue, variegated cabinet-woods of the finest grain, and susceptible of the highest polish. The forests are filled with game, and the rivers stocked with turtle and fish. Here dwell the anta or wild-cow, the Peisci boi or fish-ox, the sloth, the ant-eater, the beautiful black tiger, the mysterious electric eel, the boa constrictor, the anaconda, the deadly coral snake, the voracious alligator, monkeys in endless variety, birds of the most brilliant plumage, and insects of the strangest forms and gayest colours.

'The climate of this country is salubrious, and the temperature agreeable. The direct rays of the sun are tempered by an almost constant east wind, laden with moisture from the ocean, so that one never suffers either from heat or cold.'

Of the great centre and source of this fertility, the river Amazon itself, Mr Herndon speaks with admiration:—'The march of the great river in its silent grandeur was sublime; but in the untamed might of its turbid waters, as they cut away its banks, tore down the gigantic denizens of the forest, and built up islands, it was awful. It rolled through the wilderness with a stately and solemn air. Its waters looked angry, sullen, and relentless; and the whole scene awoke emotions of awe and dread, such as are caused by the funeral solemnities, the minute-gun, the howl of the wind, and the angry tossing of the waves, when all hands are called to bury the dead in a troubled sea. I was reminded of our Mississippi at its topmost flood; the waters are quite as muddy and quite as turbid; but this stream lacked the charm and the fascination which the plantation upon the bank, the city upon the bluff, and the steam-boat upon its waters, lend to its fellow of the north; nevertheless, I felt pleased at its sight. I had already travelled 700 miles by its water, and fancied that this powerful stream would soon carry me to the ocean; but the water-travel was comparatively just begun: many a weary month was to elapse before I should again look on the face of the sea; and many a time, when worn and wearied with the canoe-life, did I exclaim: "This river seems interminable!"

'Its capacities for trade and commerce are inconceivably great; its industrial future is the most dazzling; and to the touch of steam, settlement, and cultivation, this rolling stream and magnificent water-shed would start up into a display of industrial results, that would indicate the Valley of the Amazon as one of the most enchanting regions on the face of the earth.'

Among the fruits which grow well, without cultivation in some parts of this enormous valley, are pine-apples and grapes; the latter are so good, that a very moderate amount of skill and labour would make this an important wine-growing country.

Mr Herndon speaks with approval of a substitute for bread, made by the women of all the Indian tribes along the Amazon, in Brazil, and an important article of consumption among them. It is called *farinha*, and is made from the root of the mandioc (*Jatropha manihot*), from which the tapioca of our nursery puddings is also prepared. Salt fish and *farinha* are all the food the Brazilian boatmen on the Amazon care to have in a general way, although young monkeys roasted are easily obtainable, and are pronounced by our author to be very good eating.

An important article of commerce, even in the present uncultivated state of the Amazon Valley, is India-rubber, called there *seringa*. The district where this trade is carried on is, of course, where the India-rubber trees are most abundant—namely, at the estuary of the river, on the main banks, and on the great island Marajo, and its numerous smaller isles. The season for gathering the *seringa* is from July to January. Incisions are made in the bark of the tree, whence a milk-white sap or gum flows freely, and is caught in vessels placed below. The people employed to gather and dry the *seringa* are called *seringeros*. An industrious man is able to make sixteen pounds of rubber in a day, but the lazy Indians seldom average more than three or four pounds. Sarsaparilla and tobacco are also among the more noted products of the country.

The estuary of the Amazon is remarkable. Mr Herndon thus describes it:—‘About thirty-five miles below Gurupá commences the great estuary of the Amazon. The river suddenly flows out into an immense bay, which is probably 150 miles across in its widest part. This might appropriately be called the Bay of the Thousand Islands, for it is cut up into innumerable channels. The great island of Marajo, which contains about 10,000 square miles, occupies nearly the centre of it, and divides the river into two great channels: one, the main channel of the Amazon, which runs out by Cayenne; and the other and smaller one, the river of Pará. I imagine that no chart we have gives anything like a correct idea of this bay. The French brig-of-war *Boulonnaise*, some years ago, passed up the main channel from Cayenne to Obidos, and down the Pará channel, making a survey. But she had only time to make a survey of the channels through which she passed, leaving innumerable others unexplored. This she was permitted to do through the liberality of Senhor Coelho, the patriotic president of the province; but when she applied for permission to make further surveys, she was sternly refused by the government of Rio Janeiro. I think it would cost a steamer a year of uninterrupted labour to make a tolerably correct chart of this estuary.’

If our space permitted, we could quote many curious and amusing passages from Mr Herndon's account of the various native tribes of wild Indians, called by the Peruvian and Brazilian settlers *Infidels*—their superstition, their weapons, and their laziness, their enjoyment of life, and their dislike to innovation. Much also that is to be seen, in the way of mountain, forest, and river on this long journey, is either strange or beautiful, or both. The zoology of the region is rich and varied, and Mr Herndon paid especial attention to that department of his mission, as well as to vegetable physiology, which seems to be full of interest in the Valley of the Amazon.

The Peruvian and Brazilian governments, since Mr Herndon's journey, have entered into some small negotiations for establishing steam-boat communication between the Lower and Upper Amazon; but they are too exclusive and monopolising and on too poor a scale to be productive of any real benefit. According to Mr Herndon, it is the Brazilian, and not the Peruvian government that is to blame for this narrow and short-sighted policy. The two largest tributaries of the Amazon—namely, the Rio Negro on the north, by which it is connected with a branch of the Orinoco; and the Madeira on the south, by which it is believed to be connected with the Rio de la Plata—both join the main stream in the Brazilian territory, and their wealth would create great commercial cities at their confluence, and render the Brazilian portion of the Amazon one of the most flourishing countries in the world. But as yet Brazil is blind to its own interest; and it is left to enterprising neighbours, anxious for new markets for buying and selling, to explore and appreciate the commercial and agricultural advantages

of this vast water-shed. We will conclude our remarks with a quotation on this subject from the book before us:—

‘I can imagine the waking up of the people on the event of the establishment of steam-boat navigation on the Amazon. I fancy I can hear the crash of the forest falling to make room for the cultivation of cotton, cocoa, rice, and sugar; and the sharp shriek of the saw cutting into boards the beautiful and valuable woods of the country; that I can see the gatherers of India-rubber and copaiba redoubling their efforts, to be enabled to purchase the new and convenient things that shall be presented at the doors of their huts in the wilderness; and even the wild Indian finding his way from his pathless forests to the steam-boat depôt, to exchange his collections of vanilla, spices, dyes, drugs, and gums, for the things that would take his fancy—ribbons, beads, bells, mirrors, and gay trinkets.

‘Brazil and Peru have entered into arrangements, and bound themselves by treaty, to appropriate money towards the establishment of steam-boat navigation on the Amazon. This is well. It is doing something towards progress; but it is the progress of a denizen of their own forests—the sloth. Were they to follow the example lately set by the republics of the La Plata, and throw open their rivers to the commerce of the world, then the march of improvement would be commensurate with the importance of the act; and these countries would grow in riches and power with the rapidity of the vegetation of their own most fertile lands.

‘We, more than any other people, are interested in the opening of this navigation. As has been before stated, the trade of this region must pass by our doors, and mingle and exchange with the products of our Mississippi Valley.

‘The greatest boon in the wide world of commerce is in the free navigation of the Amazon, its confluent and neighbouring streams. The backbone of South America is in sight of the Pacific. The slopes of the continent look east, they are drained into the Atlantic; and their rich productions, in vast variety and profusion, may be emptied into the lap of that ocean by the most majestic of water-courses. The time will come when the free navigation of the Amazon, and other South American rivers, will be regarded by the people of this country as second only in importance to the acquisition of Louisiana. Having traversed that watershed from its highest ridges to its very caves and gutters, I find my thoughts and reflections overwhelmed with the immensity of this field for enterprise, commercial prosperity, and human happiness. Had I the honour to be mustered among the statesmen of my country, I would risk political fame and life in the attempt to have the commerce of this noble river thrown open to the world.’

#### HOUSE-HUNTING IN PARIS.

HOUSE-HUNTING is a disagreeable thing all the world over. In England, you are sometimes pestered with requests to purchase fixtures; in the East, you are asked to advance a year's rent, to enable the landlord to finish the roof, or put on doors and shutters; in France, you are required only to make a good show of furniture as security for exact payment, and to administer a fee to the *concierge*. So far, the advantage is on the side of our neighbours. Yet we could not wish our worst enemy a greater punishment—if he has any preconceived ideas at all as to how he should like to be lodged—than to send him on a pilgrimage of this kind through any quarter of Paris. We suppose, of course, that he is of moderate means; for a Milor or a Monte Christo can always find a palace willing to shelter him. Our houseless friend—whose peregrinations we are about to describe—wanted to

lodge himself, his wife, and three or four children, with a *bonne*, for the moderate sum of 500 francs per annum, in a rather dear neighbourhood—the eastern confines of the Faubourg St Germain. We undertook to accompany him.

It is the custom in Paris to give half a quarter's warning, at or before the hour of twelve, on the 14th of February, May, August, or November. The warning comes either from the tenant or the landlord, and must be given in writing. If one party refuses to accept it, a *huissier* is called into requisition, and then no resistance is possible; but unless the tenant be very poor, or have contrived to obtain a long credit, the owner of the house is pretty sure of recovering his rent, for he may detain furniture until he is paid, and sell it off at the end of a year. In most cases, immediately on a quarter becoming due, the porter politely informs his lodgers—for, as everybody knows, not one Parisian in a thousand occupies a whole house—that he has the receipt in his possession, and expects payment. That is a great day for him. He is in the plenitude of his power, ready to smile on the solvent, and to distribute frowns and threats to the backward. Then do all struggling people, who have complained of his negligence, found fault with his interference, talked of appealing to the landlord, snubbed his wife, or been niggardly with their New-year's gifts, repent, often too late, of their want of foresight. Some of the more artful begin to veer round a day or two before, linger before the lodge as they go up or down, smile good-naturedly, talk about the weather, ask what is going on in the neighbourhood, shew intense interest in the quarrel of the pastry-cook with the postman, and if there happen luckily to be a child, produce a real *Baba*, bought at the celebrated confectioner's on the Place de la Bourse. Men are not stocks and stones. Even though the concierge, with the assistance of his wife's superior sagacity, may see the drift of all this diplomacy, he allows himself to be softened. The admission of his power is at anyrate flattering. When the fatal statement, made with a trembling voice, that the rent is not *quite* ready, comes out, his frown is not very black, and his voice does not assume its harshest tones. He knows that the times are hard—has reason to know it—never made so little in the course of the year before, never received so few presents, never saw so many 'old clothesmen' on his staircase before. The lodger blushes: he has himself given only two francs of *étrennes*, and remembers having sold an old coat and a pair of boots; thinks it necessary to hint that he expects making a good harvest that particular season, in which case all his friends should benefit. If he is a bachelor, he invites Cerberus to play a game of cards with him some evening; but if, like our friend, he is a family-man, he finds it necessary to deplore the hour when he took so many responsibilities on himself. A week or so being thus gained, M. S—, for all these tribulations had happened to him, looked around him; but the more he looked, the more dismal did the prospect appear; and on the 14th of November, his warning was duly delivered, with an intimation, that implacable watch would be kept, so that nothing might be taken away.

It was, therefore, under more than usually dispiriting circumstances that he sallied forth to seek for a new abiding-place. As we have said, we accompanied him. At every door, in every street, of all degrees of respectability, we saw small bills pasted on little square boards, announcing: 'Large Apartments to Let—Inquire of the Porter;' 'Apartments freshly Decorated;' 'Apartments for Bachelors;' 'Small Apartments,' &c. The system of advertising, in this case as in every other, is but slightly developed in France. We have to go from house to house, guessing, from the style of the placard, whether the lodging announced as 'vacant now,' or 'to be vacant at quarter-

day,' belongs or not to the category you feel interested in. 'A Small Apartment to Let,' in a dingy house in the Rue Jacob, struck us as worth inquiring about. We groped down an alley, and in a little cupboard, called a lodge, at the bottom, faintly distinguished an enormous muslin cap, with a pair of spectacles underneath.

'What is the rent of your apartment, madame?'

'Nine hundred francs,' replied a disdainful voice.

Our civil intonation told her at once that that was beyond our figure. For the sake of information we inquired: 'How many rooms?'

'Do you mean to give nine hundred francs?'

'No; but—'

'Then what matters it how many rooms there are?'

M. S— muttered something about politeness, and drew us away. We now found several other apartments vacant, some of which were within our price. There was a bustling search for keys; and up we went—up, up dark, rugged stairs to fifth and sixth stories, where we generally found the apartments to consist of a few small rooms paved with tiles, many of which were broken; furnished with enormous fire-places, down which the wind roared in a most threatening manner; the walls covered with paper in tatters, which the landlord might consent to paste up; everything dirty and out of order. Who lived there last? A gendarme, a medical man, a littérateur, the celebrated M. —, perhaps the well-known Madame —. We said: 'Indeed!' and hastened away, especially as Cerberus casually hinted, that as the last lodger had run away, leaving a chair and chest of drawers to answer for three quarters' rent—or had been taken to the hospital—or had been transported to Cayenne—in each case to the great detriment of M. le Propriétaire, he would be glad to have so respectable-looking a tenant as monsieur, who had doubtless plenty of furniture. S— thought of his threadbare coat, and hurried off with the vague allusions indulged in by shamefaced people about 'thinking over the matter, and calling again'—whispering generally to us, however, that though he was very badly off, he was not yet reduced to put up with such a hole as that.

The ordinary rules of political economy do not seem to have sway in Paris in determining the price of lodgings. In the same street, in houses of exactly similar appearance, you will find apartments as like as two peas, for one of which you may be asked 300, and for the other 400 francs; and what is more extraordinary still, the dear lodging will be found occupied, whilst the cheap one has been deserted for months. No doubt there are other reasons for this than the cupidity of landlords and the caprice of tenants; but we could never discover them. In nearly every case, you will be told, that before the Revolution of February, people willingly paid 30 per cent. more. This has become the fashionable excuse, by the way, of all who have seen better days. M. le Vicomte —, who was ruined in 1846 by betting at Chantilly, traces all his misfortunes to '48; Madame —, the beggling widow, who is known to all the Faubourg Poissonnière, now pleads guilty to eighteen more years of prosperity than of yore, and instead of dating her husband's ruin from the fall of Charles X., appeals to warmer sympathies by attributing it to the fall of Louis-Philippe. Before '48, every one was solvent—no tradesmen speculated beyond their means—no notary indulged in forbidden luxuries—no *bourgeois* went too often to the Grand Condé; and, in fine, no landlord let his rooms dirt-cheap.

We had drawn these inferences after many hours spent in fruitless search, and in climbing twelve or thirteen stairs, with from eighty to a hundred steps apiece, when we at length, in the Rue Taranne, were informed by the porter, that on the fourth story was 'a charming little apartment,' with salon, three bed-

rooms, a cabinet, and a kitchen, to be let for the sum of 450 francs a year. The prospect was too delightful; and S— went up stairs, looking extremely incredulous. Before reaching the landing, we learned that the apartment was at that time occupied by a young couple who had once been fortunate; who had been accustomed to pay their rent 'ruby on the nail,' as Cerberus expressed it; who had recently met with misfortunes—he being shopman in an establishment which had just failed, she doing embroidery for some ladies who had left town; who owed two quarters; who had of course received warning: it was very unfortunate; but what would you have? Landlords must live. These people were now a disgrace to the house: the man was slovenly; the woman no longer dressed neatly; the lady on the second floor objected to meet them on the staircase. Really it was a pity to take any one into them, they were so miserably poor! This is but a summary of the narrative which was related to us with convulsive rapidity as we went up stairs; and no doubt it was related to every one who came on a similar errand with ourselves.

The picture had not been painted in extravagant colours. The coarse pencil of the loquacious porter had indeed left out many heightening touches. All the massive articles of furniture, the guarantee for the rent, were still there, though evidently neglected and covered with dust; but we could easily divine that many smaller things had been removed, and no doubt sold. There was a manifest air of incompleteness about the salon. It wanted those little accessories—those artistically disposed knickknacks which indicate the presiding influence of a woman's taste. We looked round as carelessly and as uninquisitively as we could. Madame Chausade, who had opened the door, went and stared sullenly out of the window: we merely glanced at her, and saw that she was pretty, but pale, and with wearied eyes. Would we like to see the principal bedroom? No? Then we had no intention to take the apartment. Really, gentlemen, look in: a nice bedstead would shew so well in that alcove. M. Chausade was lying dressed upon the bed, with his face to the wall. We said it was a pity to disturb him. He turned round and sat up: he was not asleep; but the baby was, and he had simply been looking at it. This explanation was the first impulse, for he assumed a surly air immediately afterwards, and seemed on the watch for some impertinent remark to resent. We said little. The apartment was exactly what M. S— wanted. He forgot to moderate his feelings. He would put his sofa there—his bookshelf there. The young man frowned. It was hard to hear a stranger thus taking possession by anticipation of his little nest. Had we not seen enough? Did we want to take an inventory of his furniture? The porter looked stern. We respected the petulance of misfortune, and withdrew. Madame Chausade followed us to the landing. Had we set our hearts on her apartment? Did we mean to take it at once? If we did not, and if something happened, perhaps they might stay.

This was almost an appeal; but S—, in his selfish delight at having found a comfortable place of refuge, disregarded it; and as soon as we were down stairs, paid the porter his fee, and took the apartment—conditionally, however, on his being able to shew a proper amount of furniture. We asked if there was any chance that the fortunes of the Chausades would change. 'Monsieur,' said the porter, 'I am an old man, and have observed this—when once misfortune enters a family, it never goes out of it. Who ever knew a person who had lost his situation, and owed two quarters' rent, besides the current one, getting off without giving up his furniture?' We never had; besides, the worthy gentleman had accepted our money, and if the inquiries he had to make were satisfactory—resulting in a chest of drawers, various chairs, tables, and so forth—why,

he would stick by his promise, and the Chausades must roost elsewhere.

When the fee or *denier à Dieu* has been given to a porter, it can be withdrawn or returned within twenty-four hours; but afterwards not. We made our way back towards the Rue de Bac with the news of our success. Madame S— did not share her husband's exultation. The question was, how were they to make one set of furniture answer for the debts—the one already incurred, and the other to be incurred? When this matter was arranged, she was still not satisfied. The idea of replacing the unhappy family we described was unpleasant. It would prove of evil omen. We almost agreed with her, and spent the evening gloomily in talking of the fearful struggles through which some young couples are compelled to pass on the way to fortune or the hospital. Next morning, as S— afterwards related, M. Chausade, neatly dressed, called upon him; he had obtained another situation, and had been enabled to come to an arrangement with his landlord, conditional on the new tenant's consent: Would monsieur be so kind and generous as to withdraw the retaining-fee, and not oblige his wife—he would not plead for himself—to undergo the fatigue and pain of quitting the apartment where they had lived ever since their marriage? This was a hard thing to ask, necessitating many an hour more of weary rambling; but my friend made the sacrifice; and the consequence was, that though he never entered the house as a master, scarcely a week passed that he did not come to me and say: 'Let us go and spend the evening at the Rue Taranne.'

#### THE LAUNCH OF THE ROYAL ALBERT.

A few weeks ago, we recounted our experience of the sailing of the Baltic fleet, which we had the privilege of witnessing from the quarter-deck of the *Duke of Wellington*; and it may not be an inappropriate pendant to that picture, to sketch the scene and accessories, when the brother—for we cannot bring ourselves to call so masculine a thing as the *Duke of Wellington* 'she'—of that noble and stately man-of-war was launched at the Mother Dock, as Woolwich was formerly styled, in the presence of the Queen, and a host of glittering ambassadors, nobles, and officers.

Among the list of 'sights,' there are few more imposing than that of the launch of a huge man-of-war. Contemplating the mountain-like mass, which rises nearly a hundred feet from the ground, and bearing in mind that the weight to be moved is 4000 tons, it is indeed a rare triumph of skill to animate that mass with life, and by causing it to obey the laws of gravity, send it gliding gently, yet surely, down an inclined plane, until it is cradled in its watery home.

Having frequently witnessed this imposing spectacle, we resolved on this occasion to *feel* a launch, instead of seeing it; and applying to a friend at the Admiralty, we were favoured with a card, of which the following is a copy:—

LAUNCH OF THE ROYAL ALBERT,  
ON SATURDAY, MAY 18, AT ONE O'CLOCK.  
ADMIT ONE  
TO BE  
LAUNCHED ON BOARD.

The true Londoner is a sight-loving animal. We pause not to prove our proposition, for we conceive no one will question the fact. Had we space, we might enter into a pleasant psychological argument to shew why he is of necessity partial to all shows, even to that which, with all his ardour, is, fortunately, at its last gasp—namely, the Lord Mayor's show, which glimmers

through November fogs and smoke a ghastly mockery of the real.

Were any person, however, disposed to dispute what we have advanced, we much wish the sceptic could have been with us on the above 13th of May, at nine o'clock in the morning, the place being that most uncomfortable locality, the very small first-class booking-office of the North Kent Railway. The directors of that line, with a careful eye to business, and in hopes of somewhat increasing their lean dividend, had announced by every available channel to the people of London, that they would be most happy to carry them down to Woolwich every ten minutes by their trains; and as the dock-yard gates are very near to the Woolwich Station, it was only reasonable to conclude that many thousands would avail themselves of so apparently easy a method of attaining the desired goal.

But we must suppose that the said directors are unwilling to be regarded as superior to their brethren of the South-western in intelligence; or perhaps they did not consider that so many claims would have been made upon them for accommodation, for all the confusion we described as having prevailed at the Waterloo Station on the occasion of the departure of the excursion-train to Portsmouth to see the Baltic fleet, was here repeated, with some additional annoyance of a peculiarly stupid nature. After undergoing fearful pressure in the booking-office, which did not tend to put people in good-humour either with themselves or their neighbours, we were told to go to a certain platform, by the side of which the carriages would come to convey us to Woolwich. This, however, turned out to be the wrong platform; and when the directors had squeezed some thousand people on the narrow ledge, all in a state of eager expectation looking out for the carriages, these were seen at another platform from which we were separated by lofty rails. It may be supposed that the rush which now took place gave rise to a scene of terrible struggling and confusion, in which the weak and the ladies fared badly. It may have been highly diverting to the said directors, if, as we shrewdly suspect, they were ensconced in their board-room, looking at the tumult their stupid or malicious officials had created; but what may have been fun to them was death to the hopes of many of the party in the struggle, who failed in obtaining seats. But, independently of this disappointment, it was sad to witness the manner in which the elegant dresses of the ladies were destroyed by getting over the rails. It may not have been painful to the feelings of some fair girls, who, even at the risk of spoiling a flounce, had thus so good an opportunity of displaying a pretty foot faultlessly sandalled; but we take it, that the majority of ladies—for, alas! pretty feet are rare—would have much preferred walking soberly through open gates to the carriages.

It may convey some idea of the confusion, when we state that, having no ladies to protect, we ourselves—and we are not puny Cockneys—failed in storming a first-class carriage, and were glad to put into the more humble port of a third-class, although we had paid the highest fare.

On arriving at Woolwich, we found the dock-yard gates besieged by thousands of fortunate ticket-holders, and others not so fortunate; and passing with the

crowd through the gates, we wended our way to the scene of attraction. There was no possibility of mistaking the locality, for it was made brilliantly conspicuous by innumerable flags, streaming from the summit of the shed within which reposed the gigantic ship. Around the latter were rows of seats amphitheatrically arranged, and divided into compartments—those nearest the Queen's and next the stern of the ship being the most eligible, and, consequently, placed at the disposal of the aristocracy. High over all rose the vast vessel, terminated at the bow by the colossal bust of Prince Albert—twenty feet long and six broad.

Presenting our pass, we ascended convenient but very numerous steps, and arrived at length upon the upper-deck. From that position, however, elevated though it was, there was nothing to be seen but the plain-like deck, for the bulwarks rose above the height of a man. Those, therefore, who had not the entrée to the stern-galleries saw little; but before requesting the reader to accompany us to that locality, let us ask him to join us in a ramble over the ship, which possesses the great interest of being the largest man-of-war in the world. The extreme length of the *Royal Albert* is 276 feet, which exceeds that of the *Duke of Wellington* by 30 feet; her breadth is 61 feet; her burden nearly 4000 tons; and when equipped, she will weigh no less than 5500 tons. There are five decks, beneath the lowest of which will be placed the stores, the magazine, and the machinery. The *Royal Albert* will be provided with a screw weighing 15 tons, turned by trunk-engines of 500 horse-power.

The armament will be arranged as follows:—On the lower-deck there will be ten 8-inch guns for firing shells or hollow shot, and twenty-six long 32-pounder guns; on the middle-deck, six 8-inch guns and thirty 32-pounders; on the main-deck, thirty-eight 32-pounders; and on the upper-deck, twenty 32-pounders; on the fore-castle, there will be two traversing 68-pounders; and when we remember that these can be brought to bear at the enormous distance of three miles, their effect may be imagined.

Contrasting this prodigious force with men-of-war in former days, the mind is lost in amazement; and we must not forget that these had also to act under the disadvantage of being unprovided with the auxiliary power of steam. And yet, comparatively small as men-of-war then were, they rendered good service; for it is recorded, that during the last war, the navy of England captured or destroyed 156 sail of the line, 332 large frigates, and 662 corvettes; and at the date of September 1811, there stood on the Admiralty books no less than 4023 commercial ships, measuring 536,240 tons, all of which had been captured as lawful prizes by our fleets.

The strength of such ships as the *Duke of Wellington* and the *Royal Albert* can be appreciated only by seeing them before the ships have received their armaments. The mere timber and iron in the hull alone of the *Royal Albert* is calculated to weigh 3000 tons, which is so disposed by trussing and diagonal bracing, as to render the ship literally a tower of strength. The result is a stupendous monument of human ingenuity; and that skill is not the less worthy of admiration which impels such a mass from its birthplace to its future ocean-home.

Formerly, ere science had given man a power unknown to our forefathers, the task of launching a ship was a tedious and laborious operation. Large vessels were usually floated out of the dock in which they were built, but now the beautiful operation of launching is performed in all cases; and as the manner of effecting this may not be generally known, we will briefly

describe it. To facilitate the launch, and prevent any check, the ship is supported by two strong platforms, laid with a gradual inclination to the water under her keel, to which they are parallel. Upon the surface of this declivity are placed two corresponding ranks of planks, which compose the base of a frame called the cradle, the upper part of which envelops the ship's bottom, to which it is securely attached. This cradle lies flat lengthwise upon the frame below; and being intended to slide downward upon it, carrying the ship along with it, both surfaces are well greased. The necessary preparations for the launch being made, all the blocks and wedges by which the ship is supported are driven out from under her keel, till her whole weight gradually subsides upon the platforms above described, which are called 'the ways.' The shores and stanchions by which she is retained upon the stocks till the period approaches for launching, are at length driven away, and jack-screws, if necessary, are applied to move her. The motion usually begins the instant the shores are knocked down, and the ship slides downwards along the ways, which are prolonged under the surface of the water to a sufficient depth to float her as soon as she arrives at the extremity. Sometimes, however, a large ship will not wait for the final operation of knocking away the dog-shores, but starts off with an impetus which no available force can restrain; and, on the other hand, it occasionally happens that even when the dog-shores are gone, the ship hangs, and this, as we shall see, was the case with the *Royal Albert*.

And now, let us regain our position on the highest stern-gallery, sixty-six feet above the water.

ASTOUNDING was the view that burst upon us as we passed from the cabin to this locality. Before us was the Thames, literally covered with craft of all descriptions, freighted with dense crowds of human beings, and decorated with gay flags; while beyond, the Essex shore presented a long black line of spectators. As time wore on, the seats beneath us became occupied; and long before the time appointed for the launch, the vast space around the ship was filled, and presented, from the varied and gorgeous uniforms of officers, and the dresses of the numerous ladies, an appearance not unlike a gigantic flower-bed. Ambassadors were conspicuous from their ribbons and stars; and amongst them, the Turkish minister, with his Fez and diamond orders, attracted much attention.

Meanwhile, the tide was rapidly rising, and expectation was at its height, when distant cheers, and a salute from the Woolwich batteries, announced the arrival of the Queen. The bands, one of which was stationed on the quarter-deck, played the national air, and in a few minutes the Court, attended by the Lords of the Admiralty, and a brilliant staff of officers, appeared on the crimson platform immediately beneath us. The scene at that moment was of the most magnificent description, and was certainly one of the finest features of the day. Her Majesty—leaning on Prince Albert's arm—and the royal family were now conducted along a crimson cloth-covered gangway, preceded by those very extraordinary court-buffoons who in state-ceremonies perform, though not gracefully, the art of walking backwards. On the present occasion, their evolutions were more than usually awkward, in consequence, it is to be presumed, of the narrow field for the exhibition of their powers, bounded as it was on one side by the water.

On arriving on the stage at the bow of the ship, Sir James Graham explained to the Queen the mode of performing the baptismal rite, and the small suspended bottle was pointed out to her. This was formed of clear crystal, filled with sherry, and covered with fine Honiton lace, having wreaths of roses, thistles, and shamrocks twined round it. Somehow or other, the Queen failed twice in breaking the bottle; but the

third attempt succeeded, and Her Majesty having named the ship, emphatically exclaimed: 'God bless the *Royal Albert*!' and returned to the royal booth to witness the launch. To have classically completed this part of the ceremony, Her Majesty should have poured out a libation to the god Neptune, to whom offerings were always made by the Romans, and from which the custom of breaking a vessel of wine at a launch has been derived.

The ship being now christened, and the blocks removed, it only remained to knock away the dog-shores; and soon a dull heavy sound announced that this had been effected. Every one now stood motionless, awaiting in breathless silence the movement of the ship; but although we gazed intently on an object below and on a line with the stern-gallery, it was evident, notwithstanding repeated exclamations: 'She moves!—she's off!' that she stirred not.

Great anxiety was now depicted on the face of the spectators. The tide was at its height; and the moments of suspense seemed like hours. How Mr Rice, the master-shipwright, felt, we know not; but being naturally, it is said, a nervous man, his condition was not to be envied. During this most painful suspense, which lasted about ten minutes, great exertions were made by means of jack-screws to move the ship; and presently we heard a tremendous rush of feet along the deck, which reverberated like thunder under the arched roof of the shed, and, as we heard, created no slight alarm among the ladies beneath, who, finding that the ship was not disposed to move lengthways, fancied she might topple over and extinguish them.

But happily the rush of a thousand persons on board towards the stern had the desired effect. Standing where we were, we felt at first a singular kind of trembling motion, which, subsiding, gave place to a slow but gradually increasing downward movement, and amid the shouts of the excited multitude, the roar of cannon, and the crash of the bands, which, in the enthusiasm of the moment, curiously blended *God save the Queen* with *Rule Britannia*, we saw the waters beneath us open and divide as the *Royal Albert* ploughed her now irresistible course into that element in which, we trust, she will soon gather abundance of laurels for Britannia's brow.

From our position at the extreme stern, the spectacle and sensation were alike extraordinary. We seemed to be rushing onwards and downwards with a force which could only terminate in the destruction of ourselves and the innumerable ships before us; but by degrees our speed slackened, and when the huge vessel was fairly afloat, her buoyancy caused her to rise in proportion to the extent which she had descended. But the first attempts to check her were curiously ineffective. The thick ropes snapped like threads, leaving a momentary flash of light from the water which was dashed from them as they gave way. Stronger ropes were now used, and presently a steamer came to tow us to a hulk; but so large an amount of force remained to be overcome, that we drifted far from the dock-yard before the steamer acquired any control.

At length, however, the *Royal Albert* was secured; and as we came alongside of the hulk, hundreds of boats, at the risk of being crushed, made their appearance under us to take us on shore.

We shall not soon forget descending the side of the *Royal Albert*; for the operation having to be effected for a considerable portion of the distance by slipping down a rope, we became sensibly aware of the great distance between the water and the main-deck, from a porthole on which we had emerged. This feat, however, we accomplished in safety, having fortunately allowed some impatient fellows who preceded us to remove, by the friction of their hands, the tar which rather liberally coated the rope; and then rowing to shore, we had an

excellent opportunity of contemplating the enormous proportions of this noble addition to our navy, which appeared like a Triton among the minnows around her.

#### A FEW FACTS ABOUT EMERY.

We see around us, on all sides, proof that nothing is obviously and necessarily insignificant. A material or substance, how little soever it may be valued to-day, may to-morrow become an object of interest, estimated for its usefulness in some particular circumstances. Such must ever be the case while man is picking up his knowledge bit by bit; he acquires new facts, new principles, new laws of nature; his advancing civilisation suggests to him new wants, and his wants suggest new modes of applying his knowledge. This is the mode in which the useful properties of substances are day by day becoming known. But there are other substances which have been employed from very early ages, and yet are regarded by most persons as insignificant trifles to the present day. Who, for instance, knows or cares anything about emery, except the small number of persons actually engaged in its use? What is emery to the minds of nine-tenths of those who take up this sheet? A blackish sort of gritty dust, which aids the housemaid in polishing the fire-irons. Nevertheless, it may be worth knowing that this gritty dust is an object of wealth and importance in the countries where it is found; that without it, our looking-glasses would throw very misty and unwelcome reflections upon us; our telescopes would be wanting in the curvature and polish of the lenses; our spectacles, and eye-glasses, and opera-glasses, would be turbid instead of clear; our lapidaries would be deprived of one of their most useful adjuncts; our bright steel goods would be robbed of their brightness.

It appears that emery was known to the Greeks as a polishing material; and, indeed, the name of the substance in most European countries is derived from the Greek name. The Greeks did not know what the moderns know—that the choice sapphire and ruby, the hard adamantite spar and the humble emery, are almost identically the same substance: it is one of the remarkable facts deduced by modern chemistry, that all these four substances consist of about seven-tenths alumina, the rest of the weight being made up by silica and oxide of iron. It is the mode of aggregation of the particles, rather than any difference in composition, that produces such a striking diversity in the appearance of these minerals. In Pliny's time, emery was obtained for the lapidaries and gem-engravers from the island of Naxos; and we believe this island has never since failed to furnish a supply. M. Tournefort and Dr Clarke both described the emery-mines as existing at the times of their respective visits. When Tournefort wrote—nearly a century and a half ago—the emery-mines were situated at the bottom of a valley; but the inhabitants also found emery while ploughing the ground, and carried it down to the sea-coast; it was so cheap, that the English purchased it as ballast for their vessels, paying only a crown for twenty-eight hundredweights of it. Mr Tennant, at the beginning of the present century, spoke of emery commanding, in the London market, a price of about ten shillings per hundredweight, after paying freight from Naxos. Although coming from Naxos, it is generally called Smyrna emery, because it is shipped to England from that port, and as a means of distinguishing it from emery found in the interior of Asia Minor. One of the most remarkable spots in which emery has been found, is on the very summit of a mountain called Gumuch-dagh, about twelve miles from the ruined city of Ephesus. The emery was found scattered about, and projecting above the surface of a kind of bluish marble: on breaking into the marble, it was found in nodules,

something analogous in character to the nuggets of the gold-digger; but lower down, it was in large masses—so heavy, indeed, as thirty or forty tonweights. The isolated masses are more welcome than those imbedded, as being easier of removal.

Our American brethren appear to have paid a good deal of attention to emery. In a periodical called the *Scientific American*, a year or two ago, it is stated that Dr Lawrence Smith, a geologist, while residing at Smyrna in 1847, made the discovery of a deposit of emery not before known. He reported his discovery to the Turkish government; a commission of inquiry was appointed, and the affair soon assumed a commercial character.

The mining of this emery is described as being carried on in a very simple manner—the natural decomposition of the rock in which it occurs facilitating the extraction. The rock decomposes into an earth, in which the emery is found imbedded. The earth in the neighbourhood of the block is generally of a red colour, and serves as a sign or indicator. The block of emery produces a peculiar action on the steeled point of the quarrying-rod; and this serves as another indication of the presence of the mineral, when perhaps it is not actually in sight. If the blocks are too hard to be broken by hammers into pieces of convenient size, they are exposed to the action of fire for several hours, which diminishes their cohesive tendency. As there are no means of bringing the emery from the mines except on the backs of horses or camels, it frequently happens that enormous masses are left behind, from inability either to break or to carry them.

The effects of monopoly and of new discovery on the price of emery are remarkable and instructive. The emery found in Naxos belongs to the Greek government, while that found in Asia Minor belongs to the Turkish government; and both governments seek, of course, to realise a profit out of it. The Naxos emery, from the beginning of the present century to 1835, sold for about L.6 to L.8 per ton; but in or near the last-named year, a monopoly of the emery was purchased from the Greek government by an English merchant at Smyrna; and this merchant so managed the supply—as the coal-owners of Northumberland and Durham are often accused of doing in respect to a mineral of much greater importance—as to command almost any price he pleased; from L.7 it rose in a few years to L.30 per ton. But when, in 1847, Dr Smith, whose attention was drawn to the subject by a Smyrniote knife-grinder, discovered the mines near Smyrna, the Naxos monopoly received a check. The monopoly of the new mines was sold by the Turkish government to another merchant at Smyrna; and the rivalry between the two merchants brought down the price to L.2½, L.1½, L.10; and it is expected that, by a modification of the grant made by the Turkish government, the price will become much lower. The shipowners will bring the emery to England at a very low charge, as it serves as ballast to ships which come home less heavily laden than when they go out. Here, as everywhere, the spirit of unchecked monopoly shews itself in its true colours. But—*revenons à nos moutons*.

In the preparation of emery for purposes of manufacture, it has to pass through many carefully conducted operations. The masses are first broken up into smaller lumps by hammers, aided by the action of fire in some few cases; and they are then crushed still smaller by stampers worked on the principle of ore-stampers. The emery leaves the stampers in a more angular and irregular shape than if the crushing had been effected by rollers; and this angularity is considered to aid the subsequent processes. When the crushing is completed, the emery is sifted through sieves or cylinders, made of wire-gauze for the largest grains, but of lawn for the smallest: the wire-gauze varies from twelve to 120 meshes to an inch; the largest kind thus sifted is about

the size of mustard-seed; but emery is sometimes prepared for engineers in grains as large as pepper-corns. In the stamping-room, a fine dust settles on the beams and shelves; and this is occasionally collected to form the very finest emery. It affords a singular proof of the extensive use of emery, that every degree of fineness has its own particular name, and its own particular applicability in the arts. There are, for instance, corn emery, coarse-grinding emery, grinding emery, fine-grinding emery, super-grinding emery, coarse-flour emery, flour emery, fine-flour emery, super-flour emery. The engineers, and especially the optical instrument-makers, are very particular concerning the degrees of fineness in the emery prepared by or for them, to adapt the means to the end in view. Plate-glassmakers require a large quantity of emery, wherewith to grind their large plates of glass; and the emery-powder for this purpose is brought to a still finer and more equable state by a process of washing. This is effected in a curious way. A dozen or more of copper cylinders are ranged side by side; they are of equal height, but vary from three to forty inches in diameter; they have small troughs or channels connecting them one with another at the top; and the largest has a waste-pipe near the top. The cylinders being all filled with clean water, and the emery-powder being well mixed with water in another vessel, the emery-cream, if it may be so termed, is allowed to flow slowly through a pipe into the smallest cylinder; the greater part of it flows out again at the channel into the second cylinder, but in its passage it deposits the largest grains of emery, which fall to the bottom. So it passes on from one cylinder to another, depositing finer and finer particles as the diameter of the cylinder becomes larger; and the finest of all is found ultimately in the forty-inch or largest cylinder. The emery is thus separated into sizes, and is collected and dried for use. In the plate-glass factories, the plates, rough and uneven from the casting-table, are ground one upon another with sand and water between them; they are brought level, but the surface is dull and scratched, and the polishing is effected by means of this emery-powder—coarse at first, then finer and finer.

The test sometimes employed to determine the hardness of emery, is rather remarkable. The mineral seems to consist of corundum and iron; but its colour, varying from dark-gray to black, is no decisive test of its quality. Its hardness, on which its value depends, is thus ascertained:—Fragments are broken off and crushed in a diamond mortar; the powder is sifted through a sieve, having 400 holes to the inch, and is weighed. A circular piece of glass, about four inches in diameter, is weighed, and the pulverised emery is rubbed against it by means of a piece of agate. After this has been done a certain number of times, the emery and the glass are weighed a second time, whereby it is ascertained how much glass has been worn off by the friction of the emery. Three or four samples of emery are treated in the same way, and under similar conditions; and the sample which rubs off the greatest amount of glass in a given time, is concluded to be the hardest. Dr Lawrence Smith has found that, while good emery will wear away about half the thickness of common window-glass, blue sapphire will wear away four-fifths, proving how much harder sapphire is than emery. What is the test employed by ordinary dealers, we do not know; but Dr Smith was induced to adopt this method, because agate is hard enough to crush emery, and glass is soft enough to be ground by emery. The test is not really dependent on the time or violence of the friction, for as soon as the emery becomes very fine, it ceases to wear away the glass at all, and therefore the quantity worn is definite.

Emery-paper, emery-cloth, emery-stick, emery-cake—all, as their names import, derive their value from the emery-powder distributed over them; and all are

employed for the abrading or frictive action which they produce. Emery-paper is very little else than grains of emery glued down upon paper. The paper is a somewhat coarse but tough material, made on purpose; the emery employed has about six different degrees of fineness, varying from thirty to ninety mesh in an inch, to suit various manufacturing purposes. A warm solution of size or thin glue is brushed over the paper, and the emery-powder is dusted on it through a sieve. When used by artisans, this emery-paper is not usually held open in the hand, but is wrapped round a file or a piece of wood, and is used like a file: it cuts more smoothly if moistened with oil. Emery-cloth differs from emery-paper chiefly in the use of thin calico or cotton instead of paper; it is prepared in the same way; it is preferred for household and other purposes, where it is applied by the hand alone, on account of greater durability; but smiths and engineers generally prefer emery-paper. We may here remark that glass-paper and glass-cloth, sand-paper and sand-cloth, are varieties possessing different qualities, according to the hardness of the particles employed; but the rubbing or polishing action is observable in all. The third kind mentioned above, emery-stick, is formed of a straight piece of wood, square or rounded at the edges, according to the purpose for which it is to be used; temporary handles are made at each end, by nails or wires; the stick is brushed over with warm glue, and is then dipped or rolled in a heap of emery-powder; sometimes two doses of glue and emery are given; and the emery-stick so produced is much more durable than emery-paper wrapped round a stick or file. The fourth variety, emery-cake, consists of emery mixed with bees-wax into a solid lump; the ingredients are well stirred while the wax is warm; and after being solidified by plunging into cold water, the mixture is kneaded by the hand, and rolled into lumps. The emery-cake thus prepared is not used in this form, but is applied to the edges of luff-wheels and glaze-wheels for polishing cutlery and other goods.

There is another kind of material—'patent emery razor-stop paper,' which is made in a different manner from ordinary emery-paper. Fine emery and glass are mixed with paper-pulp, and made into sheets of paper which contain the two gritty materials in their very substance; so much so, indeed, that the emery and the glass weigh more than the paper-pulp. Such paper, pasted or glued down upon a piece of wood, and slightly moistened with oil, forms a good razor-stop. It has been suggested that the leaves of an ordinary metallic memorandum-book, which have a somewhat granular texture, might in emergency be made available for a similar purpose, the fine hard particles in the paper having the power of wearing away steel.

Emery-wheels are sometimes made by a process patented in England about a dozen years ago. These wheels are the discs or 'lap-wheels' used in grinding, polishing, and cutting glass, enamels, and metals. The wheels are made by mixing coarse emery-powder and pulverised Stourbridge clay in water, to the consistency of a thick paste; the paste is pressed into a mould of a proper wheel-form; and when removed from the mould, it is dried and baked. The clay binds together the emery particles into a mass, which cuts rapidly, and yet wears away slowly. By using emery of greater fineness, wheels are formed which cut less quickly, though more smoothly.

It is just possible that a question may here and there arise, whether *Tripoli* or *rotten-stone* be a variety of the same substance as emery. An answer to such a supposed question may not be amiss. The two minerals are entirely distinct. Rotten-stone is really a rotten stone; and it is called *Tripoli* because it was first brought from that country. It is found in slaty rocks at one place, in chalcedony at another, in coal-strata at another, in thin beds of pitch-stone at another, in shale

at another; and this diversity of position led to various opinions concerning the nature and origin of rotten-stone. Some thought it to be a silicious mineral, some an aluminous mineral; some deemed it to be of volcanic origin, while others believed it to have been deposited from a liquid as a sediment. It is now supposed by mineralogists that rotten-stone is produced by the disintegration of a particular variety of limestone, probably black marble: the disintegration having been brought about by the combined action of moisture and air. At Bakewell, in Derbyshire, the rotten-stone found in the limestone district presents two very different appearances: the 'hard' variety, as the quarrymen call it, occurs in detached nodular lumps, dispersed through the debris of the limestone, and has an indurated and somewhat stony consistency, an earthy texture, a shell-like fracture, a smooth and rather greasy feel, and a colour between yellow and brownish gray; whereas the 'soft' variety, occurring as a kind of spongy earth under the debris of the limestone, has a loose and powdery substance, a greater roughness to the touch, and qualities more resembling those of earth than of rock. But the most wonderful discovery concerning rotten-stone is that which has been made by Ehrenberg, that extraordinary observer whose microscope is making such unexpected revolutions in the world of science. He has found that the rotten-stone of Bohemia and Tuscany is actually a product of organic nature; that it is composed of the exuvia, or rather the skeletons of infusoria of the family *Barcellaria* and genera *Cocconeina*, *Gonphonema*, &c. Ehrenberg is said to possess the power of defining them with such distinctness in his microscope, that he can trace their analogy with living species; and in many cases he finds the species to be identical—a curious and wonderful study: life turned into stone! And what is the size of these once living creatures? The length is stated to be about  $\frac{1}{100}$ th of a line; and as a line is about a twelfth part of an English inch, we find that these minute beings must have been less than a three-thousandth part of an inch in length!—a speck of dust to all but the eyes of an Ehrenberg.

#### IS IT PAINFUL TO DIE?

According to my observation, the mere act of dying is seldom, in any sense of the word, a very painful process. It is true that some persons die in a state of bodily torture, as in cases of tetanus; that the drunkard, dying of delirium-tremens, is haunted by terrific visions; and that the victim of that most horrible of all diseases, hydrophobia, in addition to those peculiar bodily sufferings from which the disease has derived its name, may be in a state of terror from the supposed presence of frightful objects, which are presented to him as realities, even to the last. But these, and some other instances which I might adduce, are exceptions to the general rule—which is, that both mental and bodily suffering terminate long before the scene is finally closed. Then as to the actual fear of death, it seems to me that the Author of our existence, for the most part, gives it to us when it is intended that we should live, and takes it away from us when it is intended that we should die. Those who have been long tormented by bodily pain, are generally as anxious to die as they ever were to live. So it often is with those whose life has been protracted to an extreme old age, beyond the usual period of mortality, even when they labour under no actual disease.—*Psychological Inquiries.*

#### THE FATHER OF SANITARY REFORM.

About eighteen hundred years ago, Plutarch discharged the duties of 'commissioner of sewers and public buildings' in his native city of Chaeronea. The very fashionable people sneered at the 'commissioner,' and wondered that a gentleman should stoop to anything so low; the ordinary common-sense sort of people thought it odd that a philosopher should degrade himself into a puddle-policeman;

while Plutarch's most intimate friends, who seem to have had a good deal of sarcastic humour, delighted to remind him of the remarkably exalted office to which his genius had raised him. On one of these occasions, the honest biographer made a reply worthy to be adopted as the motto of all sanitary reformers. 'It is not for myself,' said he, 'that I do these things, but for my country.' The usefulness takes off the disgrace; and the meanness the office I sustain, the greater the compliment I pay to the public.'—*The Commonwealth (Glasgow newspaper).*

#### THE FIRST SWALLOWS.

Thy calm eyes smiling to my own,  
Thy quiet tones more blithely sweet,  
Dear friend—than when an hour ago  
I watched the billows at thy feet;

Twin swallows in the April sky  
Set inland saw you, fronting west?—  
Twin stranger-birds that risk to try  
The haven of their summer rest?

A truer moral, and more bright,  
Those pilgrims shewed you, than I brought  
From the green ramparts on the height  
Where old-world nations earlier fought—

So very still 'neath any sky!  
So calm beside the unresting sea!—  
Why nobly live, or work, or die,  
If ever thus the end shall be?

If life but hold through measured range  
Of time and strife, self-nurturing doom,  
And every mocking form of change  
Repeat the ruin and the tomb?

Reply that fits the question best  
All things that breathe and bloom can give—  
The earth, through round of work and rest,  
Ripens, in loftier phase to live,

A blossom, or a bird on wing—  
Like those swift pinions west unfurled,  
Speaks promise, and each later spring  
Symbols a still progressive world.

#### PHILANTHROPIC POLICY.

Not long since, the Russians, in effect, withdrew their prohibition of the slave-trade, though they nominally retain it. Their mode of proceeding was essentially Russian. Turkish vessels are allowed to come to Anapa to purchase and carry away young Circassians to any extent, but under the condition, that they are all entered as Russian subjects travelling to Trebizond or Constantinople, and provided with Russian passports. *They have therefore a right always to claim the protection of the Russian ambassadors or consuls in Turkey.* The philanthropic Muscovites had, of course, no other view than the providing for the good usage of the slaves, otherwise it might have been esteemed a clever stroke of policy to spread persons who should regard Russia as their natural protector, through every harem, and in many high offices of state, to which the Circassian and Georgian youths often rise in Turkey.—*Westminster Review.*

#### ERRATUM.

The new church mentioned at the close of the 'Month' is No. 21, belongs to the Irvingites. The Rev. Christopher Heath is the Angel of that church, not Mr Drummond.

Printed and Published by W. and R. CHAMBERS, 3 Bride's Passage, Fleet Street, LONDON, and 339 High Street, EDINBURGH. Also sold by J. M'GLASHAN, 50 Upper Sackville Street, DUBLIN, and all Booksellers.

## DEBT AND CREDIT, AT HOME AND ABROAD.

SIX-AND-EIGHTPENCE, says one of Hook's heroes, is at the bottom of everything in this world. Of all the discussions which are discussed in this discussing age, one-half at least hinge in some way or other upon debt and credit; and yet of the millions talking, thinking, and disputing about the matter, the greater part know but little of its real principles; and there are things connected with it known to very few indeed even of the initiated.

Who, for example, would suppose that London firms of character and eminence deal, knowingly and systematically, in forged bills? Yet such is actually the case. Great money-dealers, whose names alone can sometimes turn the current of the market, have a quiet drawer in which they stow away these bills, just as they would any other. The principle upon which they proceed is a simple one. They know their customer; he is a man in business, with a stock in trade, a character to lose, and greatly in want of ready money. This customer forges to his bills the name, usually, of a near relation, or some one of moneyed fame with whom he is connected. The dealers, fully aware of the circumstance, take the bills. They know well that their customer will pay this bill before any others—that he will run all risk; refuse all payments, make all sacrifices, rather than leave these bills unpaid, with the terrible consequences of their examination. The customer, in fact, says to the dealer: 'I put my liberty, my character and prospects, in your hand: if I fail in my engagements, you will have the power to transport me as a felon. I shall not run that risk; I have such and such property—such and such connections—lend me so much money.' The dealers do not hesitate to comply.

Again: there is a class of tradesmen who will furnish goods on credit at a time when they are morally certain they will never be paid. We remember a London tailor who used to make periodical visits to Cambridge, almost forcing his coats and trousers upon every one to whom he had the shadow of an introduction, charging high prices and offering infinite credit. One of his customers left the university much in his debt, and the tailor lost sight of him for years. At last he found him, and presented his bill. His quondam customer fairly told him that he could not pay him. The tailor fidgeted, remonstrated, threatened. What was the use?—the man had no money. At last the tailor cried: 'Well, sir, if you will not give me my money, at least give me an order, that I may not quite have lost my time.' With these men, business is everything: if they can do a certain amount in the day, they

go to bed happy, compelling themselves to forget how much of that amount will never be paid for; and safe enough, after all, for the profits on their genuine business are an ample set-off against all losses. There are many even second-rate tailors in London, who, if they chose to risk their entire connection, could in a month call in between £40,000 and £50,000.

A man begins tolerably early to be initiated into the credit-system. He leaves school, where he never had a five pound-note in the world, for the university. He knows nothing of purchases beyond bats and balls, cakes and oranges. From a position where he carefully reckons his half-pence, he is removed to one where he has the command of a limited £300 a year—one hundred of which will suffice for his necessities—and the command of credit unlimited. The very day after his arrival at college, his table is covered with cards from horse-jockeys, print-sellers, wine-merchants, confectioners, jewellers, unnecessary tradesmen of all kinds and classes. Presently he is visited by a man with prints of the colleges—things, he is told, indispensable to a freshman: as for payment, he may suit his own convenience. Next walks up a dentist, who insists on examining his mouth—the tutors have such a partiality for young men with white teeth. Next is the wine-merchant—a stock of wine is so essential to hard reading, and Mr A. has the best and cheapest. It would be endless to repeat the items of the list—quite enough to turn the head of any young man who thus, at his very first entrance into life, becomes forced into habits so injurious, if not fatal, to his future career.

In modern France, the credit-system is far from being carried to the same extent which it is in England. Every one knows the neat little box in which sits the Parisian dame at one side of the shop to receive the money: if you stay there long enough, you may see that nine-tenths of the goods taken are paid for. Credit, when it is given, seldom lasts longer than a month. The butcher, if you don't pay him, is not given to threaten, but he forthwith stops the supplies. Of course there are exceptions, but this is the general rule.

Mercantile credit in the provinces is utterly deficient in the organisation it possesses in this country. We were some time ago at Orleans, and received from a distance, as cash for a letter of credit which we had forwarded, a parcel of Hottinger's notes. These were payable in about sixty towns in France, of which Orleans was not one; but I was assured that this was only owing to its proximity to Paris, and they could be negotiated there quite as easily as in the capital. There were two banks at Orleans: the first would not even look at the notes; the second undertook to

transmit them to Paris: it was all that could be done. For seven mortal days the bank waited for an answer to this simple matter, and at last paid the money without receiving it, as a special favour. And yet Orleans was in those days—it was before the railway—but a single night's post from Paris.

If you enter a Parisian bank, you are struck with the absence of the air of business. A single gentleman is probably standing with his coat-tails to the fire; he looks at your document, and very likely pays you the money out of a drawer, though, to be sure, he generally hands this part of the business over to the *caissier*. No hurried merchants' clerks, no fat farmer from the country handing cheques or bank-notes eagerly over the counter. It is with great difficulty that the banker in France will permit ordinary people to open an account, the fear is so inveterate that they may be taken in. No doubt there are business banks in Paris—as Rothschild's, and the great bank of the Rue St George; but they are very few, and even here half of the business is confined to paying *coupons*: the multitudinous requirements of British affairs are totally unknown.

At the present moment, the influence of this country, and the growing desire for greatness and excitement, which is making France a mercantile nation, as it once made it a nation of soldiers, is creating the necessity for greater monetary accommodation both for borrowing and placing money. As the bankers are not to be moved from their routine, other institutions are starting up on all sides. An institution has been established in France, completed only at the close of last year, known as the *Crédit Mobilier*. It is an immense joint-stock lending concern, taking everybody's money, as much or as little as you please, and finding for it a safe investment. It lends to the railways, to mines, to the departments, to the amount of three or four millions sterling. One of its features is worth notice. It issues notes payable at fixed periods, commonly short ones, and bearing interest during the time they run. By this means a portable savings-bank is established, in which persons of moderate earnings may invest their gains, and at the same time a useful medium of exchange is created, in which the money never lies entirely idle. It is peculiarly suitable to the Frenchman, who, as has been observed, always prefers to have his money about him, and yet is not subjected to the absolute loss of interest, which he incurs by hiding away his coin in his chimney. There is another institution for investing other people's money, whose main principle is to lend it to the communes—it is known by the name of the *Caisse des Consignations*.

The ordinary use of the *billet de banque* dates only since the Revolution of 1848. Of course the Bank of France issued as many of its notes in previous years as the public chose to take; but excepting in the great towns, the public did not choose to take them. The great convulsion six years ago, both by testing the stability of the Bank and by its destruction of the old systems of managing money, did an immensity of good to the Bank. At present, the notes of the Bank are found everywhere. Up to 1848, it had no branches in the great towns, from the opposition and influence of the local establishments. Up to 1811, the Bank had but three branches anywhere—at Rouen, Lille, and Lyon; and these it was forced to shut up in that year for want of business. During Louis Philippe's reign, fifteen branches were established—all in second-rate towns. Since 1848, they have been established in the great towns.

Institutions exist in the south, at Marseilles especially, which the good people there consider a marvel of convenience—with us it would seem the clumsiest and most primitive idea imaginable. The principle is this: A grocer wants to buy a cargo of plums, which he has not the money to pay for. He goes to the Bank of Exchange as it is called. The bank gives him an order

for the plums, on his making over to it an equivalent in sugar. This sugar it hands over to another of its customers who wants it, and, in the multiplicity of its business, finds something to give in exchange to the original owner of the plums. This is the principle on which traders went, not merely before paper-currency, but before coin itself was known. It is systematised and modernised, but it is the same. An Englishman would find it a much simpler proceeding to borrow money of the bank upon proper security, and purchase the plums upon his own terms. As it stands, he is compelled to submit to the terms of other people. But, as he cannot borrow money, he is glad to find such a substitute for it as he can meet with. Money on mortgage, so easily found with us, is obtained with far greater difficulty in France, and under many formalities—it usually commands from six to ten per cent. It is much more easily raised in Germany, where mortgages are systematised. A large establishment, authorised by the state, manages this kind of business in many of the Teutonic kingdoms, where the ownership of each estate is registered, with all the contingencies, successions, and liabilities to which it is subject, and its value accurately ascertained. This makes mortgaging a wonderfully easy business. The French are slowly endeavouring to imitate their neighbours in their facilities on this head.

Notwithstanding the limited range of the credit-system on the continent compared with its extent in England, there is enough left to do a world of mischief. In fact, what credit does exist, is in great part in the most mischievous shapes. Its annals are full of the piquancy inseparable from all the proceedings of our lively neighbours.

The borrowing-system in France is divided into three professions. You have, first, the usurer; secondly, the *entremetteur* or *proxénète*; and thirdly, the *faiseur* or agent. These three differ as entirely in their personal character and habits as they do in their several departments of business. The usurer keeps his gains, the *faiseur* spends them in gambling at the bourse, the *entremetteur* in cabaret-dinners in the *Banlieue*, in a society we blush to name.

The usurer never sees the pigeon, or very rarely. He is banker, count, minister of state, director of theatres, lives in a grand hotel, gives dinners to princes, dresses in suits from Dusantoy, and is far above the acquaintance of a mere pigeon. This he leaves to the *courtier*. This last, a genteel and knowing personage, deals in everything. He tells the pigeon that if M. —, not being inclined to part with his ready money, can only give wine or furniture in exchange for the bill, he, the *courtier*, will undertake the sale; and this he does, upon occasion. But in the majority of instances, wine, furniture, and all the rest of the old story, is a mere pretence. The pigeon proposes a bill. The *faiseur* goes to the banker, and gets it done at fifty per cent. in ready money. He returns to the pigeon, says that the bill is discounted, but that the price is given in goods, which he will undertake to sell. In two or three days, he returns with the story that the goods are not to be sold. The pigeon is impatient. The *faiseur* then offers to take the goods at his own risk, at a discount. This the pigeon is only too glad to do, and gets one-half of the money handed to the *faiseur*, just one quarter of his bill. The *faiseur* gets the other half, without any risk whatever; and in half an hour is to be seen trotting down the Rue Vivienne, eager for the excitement of the new loan, or the latest scheme.

This is the most favourable result, and too happy ought the pigeon to be with it. He is lucky if money is handed to him at all until within two or three days of his bill falling due—just in time to get the agent from the charge of bill-stealing, conceals where the French laws are rather rigorous.

As for the amount the pigeon receives, he may, as we have said, receive a fourth, but not uncommonly he receives nothing, and that without the suspicion of bill-stealing. Authentic instances are known where the pigeon has taken a horse for a note of 1000 francs. The horse remains in the stables of the courtier, who in a few days sends in the bill for its keep—thirty francs. The pigeon orders the horse to be sold by auction. It fetches twenty-seven francs. All the pigeon gets by the transaction, is the pleasure of paying three francs ready money, and the bill when it becomes due. In another case, equally authentic, a young man signed a note for 28,000 francs. He was credited in return with 60,000 blocks of marble, 11,000 mouse-traps, 6000 iron rods, and 3000 francs in money. The marble remained in the quarry; no one would buy it *in situ*, or advance the money for its removal. The mouse-traps and rods sold for about a thousand francs, and the pigeon was finally credited with 4000 francs, and received about half, the courtier pocketing the rest.

The number of these courtiers in Paris is estimated at above 20,000; there are above 10,000 in the provinces. Let any one who knows the lives, habits, and expenses of these men, estimate the amount of loss in a single city which feeds 20,000 courtiers.

We had almost forgotten the *proxénète*. It is his business to discover youths in difficulties, or out of difficulties, with easy temperament and eyes liable to be dazzled. They haunt especially the écoles of droit and medicine, places where extravagance and libertinage are prescriptive. These are the worst of their class—seedy, stale, and villainous-looking men, who have no need even of the appearances of character. A better set, at least in appearance, loiter around the hotels or apartments of the rich. They must, in this instance, have the manners and clothes which would not subject them to be kicked into the street by the domestics. Their highest flight is into the salons of an actress; their lowest, the cells of Clichy—for the prisons themselves are not beyond their arts and expectations.

The annals of the prison of the Rue Clichy, or its predecessor, St Pelagie, are yet more fertile in extraordinary characters than those of our own Fleet. Some of these same characters, it may be observed, were English. There was the famous Swan, who lived there three-and-twenty years, and only preserved his post by threatening his wife, his daughter, and his son-in-law to disinherit them, and give all his property to the prison, if they paid his debts. He used to pace the corridors half the day, which he called his 'town of the Bois de Boulogne.' Released, much against his will, by the Revolution of 1830, he died of his liberty in a few months, before the re-establishment of affairs could enable him to find fresh debtors and a new imprisonment.

One of Napoleon's men declared that he never was so happy as in prison, for it was the only place where he could not ruin himself. Released by the course of law when seventy years old, at which age no man in France is allowed to be a prisoner for debt, he used to amuse his friends by calculating the millions he had saved by his sojourn in prison, and demanding where he could have employed his time to more advantage. This was Ouvrard's way of looking at the matter. Every one has heard of Ouvrard, the great banker, who received other people's money to the extent of 5,000,000 of francs, never spent it, hoarded it in rich investments, and laughed at his dupes from the gay walls of Clichy. Five years, by the French law, is sufficient imprisonment for any man, whatever he owes; at the end of this time, he is released as a matter of course. Ouvrard's friends and connections, peers and ministers of state, remonstrated with him on his proceedings. 'I have no peculiar fancy for prison,'

he answered: 'find me another place where I can gain a million a year, and I will leave Clichy on the instant.' He did his business in style: if he wanted the chamber of any prisoner, he would pay his debts to secure the vacancy. He hired an entire house opposite the prison for his domestics and his cuisine. Every day, his dinner-party consisted of twelve persons. This life, and a million a year for leading it! What wonder if M. Ouvrard was content with Clichy?

Another of the imperial barons, formerly prefect of a department, found his way to Clichy. He recognised in the doctor of the establishment his physician in his prefectorial days. The doctor expressed his astonishment at finding so great a man in such a situation. 'What would you have, my friend?' said the prefect. 'I have a rent-roll—rather a large one—but it went to pay the interest of my debts. Now, I receive it without deduction; boil my own coffee in the morning; an excellent *femme de ménage* prepares my dinner; I have five or six capital fellows to share it; I spend the evening in whist and punch—a jovial life, of which I shall certainly not be tired for five years. I shall then go abroad into the world not owing a farthing, and without the disagreeable necessity of receiving my rents only to hand them over to other people.'

It is the commonest thing in French society to hear men expatiating on the delights of their 'little *boudoir* in Key Street,' Rue de Clef—the cant term for Clichy amongst all choice spirits. Another term is, 'the palace of debt.' In fact, its gay courts, where flowers, water, trees, and a well-swept lawn afford him amusement in the sunny hour; a joyous companion and good cheer when the sun no longer shines; a well-stocked library of romance; and the knowledge that all restraint will end in a few years, without the stigma of bankruptcy, the distasteful gathering of creditors, the angry frowns of a commissioner, or the most uncomfortable queries of an opposing counsel—all this unites such a variety of charms, that the expression is more than justified. Not unfrequently, young men who, at their first entrance into Clichy, give themselves up to despair, spend their days in writing lamentations to choice friends, and sternly refuse all companionship with their fellows, in a few months are rioting amidst all the excesses and enjoyments of their new position, leaving their distant friends to fancy them dead, from the total cessation of their jeremiades; declaring that they had found in the prison the most charming of companions, and had crowned their felicity by making the acquaintance of a rich and venturesome usurer. One of the great recommendations of the place is, that a man can receive society which he does not venture to bring within the walls of his own house.

Our own happy and enlightened country, in the last century, has the merit of being the only one in existence which first locked up the debtor, and then starved him. This was actually and literally the case, unless a man could live on a half-penny a day. The old records of our debtor-prisons are full of persons starved to death. The old Roman law, which permitted the body of the debtor, after a certain time, to be cut to pieces and distributed, like the Levite's concubine, amongst his creditors—even this not particularly humane and sensible law guarded against actual starvation. Starving to death was a punishment reserved for Italian barons of the time of Count Ugolino, and English gentlemen of the time of Fox and Wilberforce.

All the legislations of Europe compel the creditor to allow the debtor sufficient to keep him from starving. Sometimes the sum is fixed, as in France, at a franc a day; sometimes, as in Holland, it is regulated by a tariff fixed by the government, according to the price of provisions. In all, the allowance must be paid for a month in advance by the creditor; and if he fails, the debtor is instantly released; but in that case he may be arrested again for the same debt.

The legislation of Geneva is peculiarly lenient. It forbids the bed of the debtor to be taken under any circumstances. Unless there is nothing else to pay the debt, it is compulsory to leave ploughing instruments, farm animals, and a month's supply of flour. The creditor is likewise compelled to leave, at the option of the debtor, one cow, two goats, or three ewes, workmen's tools, and the instruments of the art or profession of the debtor, to the value of sixty florins. As in the rest of the continental system, the debtor is entitled to release as soon as he attains the age of seventy years. But Geneva is in another respect the most lenient towards the debtor. In France, the prisoner is discharged, as a matter of course, after an imprisonment of five years; at Geneva, after an imprisonment of three. He can be imprisoned anew, however, if he shall afterwards come into possession of notorious means of payment.

The old annals of the Fleet will produce instances of prison luxury and extravagance equal to those of M. Ouvrard. Prisoners served upon plate are upon record more than once. There are, on the other hand, some piquant stories of a different character. Thomas Pope was confined in 1792 for a debt of L.10,000—money which he had appropriated in his capacity of executor to a baronet. It was discovered after he had been put in prison, that he was worth at least L.100,000. He lived in the most penurious manner—spending less than L.50 per annum. From the length of his confinement, he was entitled to a better room than ordinary—this he let to another prisoner for a guinea per week, and contented himself with one at a shilling. Meanwhile, he was actually saving L.500 a year, the interest of his debt and expenses, which the creditors could not legally claim during his imprisonment. To be sure, this was a good way from the million francs per annum of M. Ouvrard.

A man was at the same time confined within the walls, who at once amused and enriched himself by building houses within that favoured locality. The prison authorities stated at the time, to a committee of the House of Commons, that very many prisoners omitted to sue out their discharge when they were entitled to it; and in some instances the debtor, freed by the act of his creditor, actually refused to quit the place, and it became necessary to turn him out by head and shoulders.

The prisoners, when they could afford it, used to amuse themselves by changing, by habeas, one prison when they became tired of it for another. Many of them spent the winter regularly in the Fleet, and the summer in the Queen's Bench, taking their seasons like other fashionables. It was supposed that the summer in the Fleet was peculiarly uncomfortable and unhealthy.

It is enough to make one's blood run cold to read the annals of debt imprisonment scarcely fifty years ago. No medical advice allowed in the prison—men and women dying of disease—no support but chance charity—clergymen and ladies perishing from actual want. But the most outrageous anomaly was this—a man might be arrested, if his supposed creditor had a spite against him; he might be in prison positively for twelve months before it became necessary to try his cause, and after all, he might, and frequently did, obtain a verdict. He had no remedy or compensation whatever for his long imprisonment, except by pleas so difficult of proof that no one was ever known to make the attempt. Worse than all—a man might be arrested and kept in prison for a year for a debt which he did not owe, and when the injustice of the claim against him was proved, might still remain a prisoner for life, because unable to pay the prison-dues.

In those happy times, prisoners slept on the stairs—men, women, and children by dozens in a single small room, and if a prisoner died his body remained for

days in the same room with his former chums! This was in the days of Wilberforce and Whitbread; of Pitt and Fox, of the fathers of the present generation, and even of some of the present generation itself. Truly, the march of civilisation is subject to wonderful caprices. Amongst other things, the arrest of insane persons for debt was not an uncommon occurrence.

So far as legislation is concerned, a few years have done wonders in the improvement of our system of treating debt legally. The next great step must come, not from the lawyer or the legislature, but from society itself. The one has at least done something—the latter has everything to do. Corrupting the young—tempting the inexperienced trader to overtrading—pandering to the passions of the rich—making a lottery of credit—offering unlimited advances at huge premiums on the purest risks—forcing goods on people, to be paid for at their convenience—and even sacrificing all hope of payment, for the sake of doing business: all this is beyond the reach of the most searching law. We have been a thousand years making physical laws against the debtor—it is time we did something to enforce a moral law against the creditor. Hitherto, the moral punishment has been all on one side, while the fault is with the one at least as often as it is with the other.

### CONVICT LITERATURE.

It is a common observation that everybody writes now-a-days—that the literary power exists, in a greater or less degree, in all classes and characters of men. But perhaps this sweeping theory, if closely examined, would receive some modification: we should be inclined, for instance, to except the more vulgar rogues and vagabonds, such as the thieves and burglars sent every now and then in ship-loads to the antipodes. Some remarkable examples, it is true, might be quoted, in which the literary feeling appears to have co-existed with criminality even of the meanest nature; but these, one would think, must have been wholly exceptional, proving, by their rarity, and the attention they attracted, the almost universality of the rule.

There lies before us, notwithstanding, a literary performance, the work, in a great measure—not of evil-doers brought up in some sort of refinement, and now in a compulsory pause of their career reverting to the feelings of the past—but of a miscellaneous assemblage of rogues of the commonest order, meeting by chance in a convict ship, and thrust forth from the country they had outraged and disgraced.\* If we bear in mind, too, that offenders are rarely sentenced to transportation, till they have appeared at the bar four or five times, it will be with no small interest we shall read the lucubrations of this convict crew, furnished instantaneously in response to the call of their Superintendent for contributions to a periodical he thought fit to establish on board. Let it not be thought, however, that we claim for these papers the praise of literary excellence of any degree; we are content to see in them manifestations of thought, and proofs of the moral and intellectual existence of the individual beyond the circle of his bonds and crimes.

The prisoners in question had the good-fortune to be placed under the superintendence of Mr Daniel Ritchie, a navy-surgeon, pre-eminently qualified for the trust by a rare union of firmness and humanity, accompanied with a strong leaven of that enthusiasm which is necessary to support men in the discharge of a difficult and trying duty. In the spring of 1852, he was appointed by the Admiralty, Surgeon-superintendent of the *Porpoise* Bomanjee, a transport hired for the conveyance of 300 convicts to Van Diemen's Land, with a pension

\* *The Voice of our Exiles; or Stray Leaves from a Convict Ship*. Edited by Daniel Ritchie, Esq., Surgeon, R.N. Edinburgh: Macdonald 1854.

guard of thirty men and their families. The following is the classification he gives of his prisoners, with a hint of the theory by which he was himself governed:—

'The mental condition of a considerable number was certainly defective in a varying degree, from some slight aberration to nearly absolute imbecility. The ignorance and depravity of others, who had been reared to crime, were so great as almost to abrogate the power of conscience, or so to pervert its indications as to destroy all rule of life. A few had been driven, by excited passions, through a series of follies—too mild a term—until accident rather than inherent vice precipitated them into some criminal action. By far the largest proportion, however, had first acquired habits of intemperance, which, unsettling the reason in a similar degree to the physical structure, left no sound protecting power. If we add to the above a small number who were forced into crime by want of the necessities of life, or by temptation in a moment of forgetfulness, we shall probably have a classification in which every convict could be arranged, in some degree, as the inmates of a lunatic asylum, according to their mental defects. There is this important difference, however, that while a majority of the patients in the one case are incurable, in the other they are nearly all susceptible of being restored to a correct frame of mind, by restraint and education.'

The education here meant is general training—physical, moral, and intellectual. The convicts were compelled to a system of order, regularity, obedience, cleanliness, and attention to personal appearance; and in addition to daily school-instruction, they received daily admonitions and addresses on moral duty, and heard morning and evening prayers, with short practical lessons from Scripture. Over and above all this, was 'the healthful stimulus created and sustained by a weekly journal, conducted by themselves, thus developing the reasoning powers, and engaging their thoughts on intellectual subjects.'

From this journal, as the surgeon-superintendent told them, not much was expected in the early numbers; but he counselled them to persevere, and to regard the opportunity as an important one. 'Be persuaded to listen to the holier impulses of your nature, and employ the talents which God has given you, that by their vigorous exercise they may acquire a dominion over the brutish instincts, and call into existence the germs of a higher and purer life.' The call, considering all circumstances, seems to have been responded to with great energy. The reader may perhaps remember smiling some years ago at the verses scrawled on the walls of Newgate by a juvenile thief—

He what prigs what isn't hisn,  
When he's cotched must go to prisn;

but if he expects anything of this kind in the journal of the *Pestonjee Bomanjee*, he will be curiously deceived. These verses contain merely a hard, dry, material fact—a stony fact, like the walls on which they were inscribed—but observe the lightness, nay, the grace, with which an unfortunate convict commences his *Prison Reflections* at the opening of the journal:—

The summer sun throws dazzling light  
On scenes around Portsea;  
Reflected on the waters bright,  
Are ship, and tower, and tree.

The sea-mew flies with airy bound,  
Or wanton skims the sea;  
The sailor's song rings blithely round  
The homes of liberty.

Following this piece there is an *Essay on Sin*, in which the author draws a forcible picture of the misery which he and his comrades have brought upon themselves. 'We cannot obliterate the past,' he continues,

'but we can look back upon it with regret, and draw such profit and instruction from it as may stimulate us to exert ourselves with diligence and propriety for the time to come. We have all, through a kind and judicious government, been granted opportunities of improving our minds, and, what is of infinitely greater importance, insuring the salvation of our immortal souls. We have been placed under the teaching of faithful ministers, who have arduously laboured to shew us the folly of sin, and the importance of awaking to a life of righteousness.' This essayist was a bonnet-maker by trade, but by practice a thief or pickpocket. After his final apprehension, his mind turned towards religion, and his 'behaviour on board was perfectly in accordance with the faith he professed, being quiet and unobtrusive, unless urged by a generous anxiety to occupy a more prominent position in instructing his more ignorant fellow-prisoners.' This is an interesting picture from another of his essays, *Divine Service at Sea*:—'A loud shrill whistle was the signal for us to attend divine service on the quarter-deck, it being the Sabbath-day. I was much gratified with the scene which presented itself: the juvenile members of the congregation—the soldiers' children—were seated in front of the poop; behind them were the soldiers under arms, and their wives occupied any little vacant spaces; on the right stood the surgeon-superintendent, and on the left, with the officers of the ship, was the captain; the sailors seated themselves under the break of the poop, in the rear of the pulpit, while the prisoners formed a semi-circle in front. A solemn silence prevailed; not a sound was to be heard but what was occasioned by the slight flapping of the sails: all nature appeared calm and tranquil. Above our heads had been spread an awning, to protect us from the scorching rays of that glorious sun which seemed to smile upon the convict ship as she lay becalmed on the so often turbulent but now peaceful ocean.' Another of the author's essays, *Danger or no Danger*, is distinguished by its fancy, but, like most of this convict's productions, is too exclusively religious for a lay periodical.

Some verses, that are a little in the street-ballad style, do not prepare us for the character the author receives. The poet tells us of the kind surgeon and the prison chaplain, who

Use their best endeavours to try and make us see  
The chain of sin with which we're bound by Satan's  
tyranny;

and concludes with

And should the Lord permit us to reach our journey's  
end,  
Be sure he will a blessing on our poor exertions send.

This gentle and religious writer, however—a tailor by trade—had been five times in prison. 'He was essentially vicious; and no training, no discipline, will probably ever change him. In his nature he resembled the fox—sly, mischievous, plausible, yet untamable. There did not probably exist in his composition one spark of any generous or ennobling feeling. His cowardice alone shackled his evil disposition. Whether this idiosyncrasy is congenital, or merely the result of habit and vice, is doubtful; but it appears impossible to view it otherwise than as displaying some peculiar mental conformation, probably dependent on the physical structure of the individual. There was nothing, however, remarkable about this man's cranial development; his capacities were above the average, and his appearance would have been prepossessing but for a peculiar expression of the eyes, which, always indicating a consciousness of guilt and a felonious intention, renders the possessor repulsive. He was sentenced to seven years' transportation for theft, of which time he had already served more than two and a half years, in separate confinement, and employed in

public works, so that he would probably, soon after his arrival at Hobart Town, obtain a conditional or free pardon.'

Another religious poet, who begins with *My Bible*, was remarkable, it seems, for exhibiting 'so much talent united with such loose moral principle.' The superintendent, however, appears to think that he succeeded in reforming him; but if so, we are quite sure that, during the progress of his reformation, he stole from somebody, whose name we forget, an *Ode to the Flying-fish*, and palmed it upon the worthy editor as his own property.

A contributor of prose, who was in prison three times before his present sentence, indulges in recollections of his early school-fellows, and concludes with a paragraph which might find a place in a new volume of *Elegant Extracts*: 'There is nothing in these histories to dazzle, but there is much to instruct us. In them we observe not only examples of men rising from humble life to influential positions, but in the characters collectively of such men we behold the source of our national greatness. It is to the collective wisdom, the silent industry, the native energy of men like these, that the great middle class of Britain owes its moral power. By their intellect and commercial enterprise, they have raised their country to the pre-eminent position she holds in the scale of nations, and endowed her with that power which influences the destiny of the world.'

A housebreaker, who had previously suffered imprisonment for another crime, furnishes *The Railway Spiritualised*—not honestly come by we fear, though the editor is sanguine on the point.

The line to heaven by Christ was made,  
With heavenly grace its rails are laid;  
From earth to heaven the way extends,  
To grace eternal, where it ends.  
Repentance is the station, then,  
Where passengers are taken in;  
No fee is there for them to pay,  
For Jesus heralds all the way.  
The Bible is the engineer,  
That points the way to heaven clear;  
Through tunnels dark, 'neath mountains high,  
It guides the pilgrim to the sky.  
Truth is the fire, and Love the steam  
Which moves the engine and the train.  
Hence, all who would to glory ride,  
Must come to Christ, and there abide  
In the first, second, or third class.  
By faith, repentance, holiness,  
You must the prize of glory gain,  
Or you with Christ will never reign.  
Come, then, poor sinner! Now's the time,  
At any station on the line!  
If you repent and turn from sin,  
The train will stop and take you in!

The volume may be described as a Curiosity of Literature; and one of an interesting and instructive kind. The contributors are for the most part thieves, burglars, forgers, and fire-raisers; yet there is not a sentiment contained in it that might not be fitly instilled into her child by a mother, not a doctrine that might not proceed from the most orthodox of pulpits. Does it not seem as if the crimes of the convict had been committed by some detached inferior part of his nature during the silence of his unawakened soul? And is it not reasonable to conclude, that by a wise management of the circumstances that surround him, we may bring about the natural balance, and give him the *habit* of right thought and creditable action?

This was the theory on which the benevolent and careful superintendent proceeded. But he did not attend to moral circumstances alone: he watched over the health of his prisoners, as a thing essential to the progress of their reformation; he gave them as much

as possible of the purifying air of heaven between decks, as well as above; and by enforcing cleanliness and attention to personal appearance, he gradually raised them from their abyss of degradation. In this way he kept on the better movement already commenced in their imprisonment on shore, and landed them in Tasmania in a state, both moral and physical, which fitted them for re-entering energetically upon the active duties of life. Their services were eagerly sought for; they all found instant employment; and so far as he could learn afterwards—for he did not quit the country for some time—they had good reason to look back with satisfaction upon their voyage, and upon the Journal of the *Pestonjee Bomanjee*.

## THINGS AS THEY ARE IN AMERICA.

BOSTON—LOWELL.

AFTER paying a few visits to Brooklyn on the one side, and the New Jersey shore on the other, I left New York, and proceeded northwards to spend a short time in New England; my journey taking me direct to Boston in one day—distance by railway 236 miles, for which the fare was five dollars. By this line of route, very large numbers pass to and from New York daily. The cars, starting in detachments, with teams of horses, from Canal Street, were united in a long train outside the town, and then drawn in good style by a locomotive at the rate of about twenty-five miles an hour. The line, which makes a considerable bend in its course, proceeds by way of New Haven, Hartford, Springfield, and Worcester; and so traversing a populous country, goes through the state of Connecticut into Massachusetts.

After passing New Haven, a handsomely built town, the seat of Yale College, the country improves in appearance; and in the neighbourhood of Hartford, within the valley of the Connecticut river, the land is green, rich, and beautiful. When we reach Springfield, the arable plains of Connecticut are exchanged for the rugged and pastoral hills of Massachusetts; and we need not to be told that we have arrived in a region which depends not on natural products, but on an intense spirit of manufacturing industry for its wealth and importance. Placed on a group of conical mountains, partly environed by inlets of the sea, Boston is seen on our approach to be an odd mixture of towns and lakes, which the stranger requires several days to comprehend—and which I cannot say I quite understand even yet. A fine bay, as formerly noticed, admits shipping from the sea up to the various wharfs that fringe the lower parts of the city, and renders Boston one of the best seats of exterior commerce on the whole coast of America.

It will be recollected, that it was not in this inviting harbour that the 'Pilgrim Fathers' landed in New England, December 23, 1620; but at Plymouth, about thirty-six miles distant along the coast to the south. Boston was settled ten years later by a fresh band of English refugees, fleeing from religious persecution, and was at first called Tremont; but this descriptive name was afterwards changed to Boston, in compliment to the Rev. John Cotton, who had emigrated from Boston in Lincolnshire; and so Boston it remains, along with all its traditions, historic and biographical. I hinted on a previous occasion, that a glance at Boston would disenchant any one from illusory ideas respecting the Americans. The city, occupying the slopes of a rounded low hill, is thoroughly English in aspect—the brick-houses, smarter, perhaps, and

excelling in their brilliant green jealousies, plate-glass windows, and general air of neatness. A number of the public and other buildings are of granite, and the broad side-pavements are of this durable material. Boston is English even in its irregularity. Instead of being laid out on the rectangular American pattern, and garnished with rows of trees, the streets wind and diverge in different directions, some broad and some narrow, some steep and some level, according to fancy or the nature of the ground—the greater part clinging parasitically round the chief of the Tremonts, which is crowned with the conspicuous dome of the state-house.

I was not prepared by any previous account for the throng of carriages, drays, and foot-passengers in the leading thoroughfares of Boston. Washington Street, which stretches longitudinally through the city, cannot be compared to Broadway in New York, or the Strand in London, yet as a fashionable business thoroughfare it has few equals. Tremont Street, which is parallel with it a little higher up the hill, is another principal avenue through the city, communicating at one end with the celebrated Boston Common. This is much the finest thing of the kind in America. It is an enclosed piece of ground, fifty acres in extent, ornamented with trees and a fountain, irregular in surface, and enclosed with a railing; it is always open for foot-passengers, and is devoted exclusively to the public use. On three sides, it is bounded by a terrace-like street, with a range of well-built houses, the residence of the élite of Boston. This spacious grassy common has a general inclination to the south, and at its upper part, the line of street embraces the state-house, from the summit of which a very fine panoramic view of the city and its environs is obtained.

In Boston there are some public buildings in the best styles of architecture, and it may be said that to whatever side we turn, evidences of intelligence and taste are presented. After a visit to New York, the appearance of Boston is particularly pleasing. Instead of dirt, noise, and all sorts of irregularities, we have cleanliness, comparative tranquillity, and, as it seems, a system of municipal government in which things are not left altogether to take charge of themselves. In these and some other respects, Boston will probably please all who like to see a well-managed and respectable city—its police not a sham, and its streets really swept in requital for the money expended on them. So far are police arrangements carried, that smoking, as I was informed, is not allowed in the public thoroughfares. A regard for neatness and decorum was a predominant feature in the minds of the Puritan settlers of Massachusetts, and still remains impressed on the character of their descendants. We can, indeed, see that in manners and various social arrangements, the New England states—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut—possess a distinctive character. The cradle of civil liberty, they are also the source of those great schemes of free elementary education extending over the Union; while in most things which tend to general improvement, their people are generally seen taking the lead. Some writer has remarked, that the comparative barrenness of the soil of Massachusetts has proved an incalculable blessing to America. Unable from natural sources to support a large population, the country has thrown off swarms of emigrants, who have carried with them the shrewd keenness, perseverance, and love of independence of the New England race, which, in point of fact, is a living type of the hardy and thoughtful English who battled against the Stuarts in the middle of the seventeenth century. Spreading into other states, these New Englanders are seen to win their way by an aptitude for business and a wonderful power of organisation. As merchants, lawyers, and magistrates, they

might almost say the cement—of American society. Retaining the temperament and modes of expression of their English ancestry, we find that they are more wiry in constitution, and speak in a higher and more nasal tone than is observable elsewhere.

Moulded from a Puritan ancestry, it might be expected that the Bostonians, with many changes in sentiment, would still possess a slender appreciation of the fine arts; but the elegance of many of their buildings, and their love of music, demonstrated by the recent opening of a large and handsome hall for musical entertainments, would infer that they retain little of the ancient sourness of manners. They are, however, like another people whom we could name—not signified by any love for theatrical representations. The drama, I should think, is in a low condition in Boston. I went one evening to a theatre, which was tolerated under the name of a 'Museum.' To invest it with this illusory character, its spacious vestibule was environed with cases of dried snakes, stuffed birds, and other curiosities, which nobody, so far as I could see, took the trouble to look at, the centre of attraction being a theatre beyond, fitted up with a hanging-gallery, and pews as like a church as possible. The house was crowded with a respectable and attentive audience, but the acting was of an inferior kind; and what in my opinion was more objectionable, the piece performed was a melodrama, in which religion was irreverently blended with buffoonery. I am at a loss to say whether this, like the adoption of the term 'Museum,' was a device to soothe public prejudice, but it communicated that impression.

One of the days of my sojourn in Boston was the 24th of November, which, by proclamation of the governor of Massachusetts, was kept as Thanksgiving-day—according to an old custom—in the New England states. The institution of this religious festival is traced to an early period in colonial history, and has gradually assumed a national character. Each state may select the day most convenient to itself; that adopted, however, by Massachusetts, seems to set the fashion, and accordingly there is an almost universal holiday. On this occasion, all business was suspended in Boston, the stores were shut, and the churches of every denomination were open. In the afterpart of the day, things relaxed a little. There was a thronging in and out of the city on excursions and visits, and among other signs of jollity, the 'Museum' opened its attractions. The day, in short, came pretty closely up to the old English Christmas—one half devoted to church, and the other half to dining and amusement, like a genuine mediæval festival. I was told that the meeting together of members of a family on Thanksgiving-day was maintained as a sacred practice in New England, and that many travelled hundreds of miles to be present. It is not less a universal custom to have a turkey to dinner on the occasion of these family reunions; those too poor to purchase this delicacy, are usually presented with it by friends or employers; and, as may be supposed, the number of turkeys required throughout the New England states is immense. The opening of the churches for public worship permitted me to attend King's Chapel, a respectable-looking stone-built church, nearly opposite the Tremont Hotel, where I had taken up my quarters. This church, fitted with high family-pews of dark wood, like those of the parish churches of England, retained very nearly the appearance it possessed previous to the revolution, when it was the place of worship of the English governor of the province. The service was liturgical, but differed in some respects from that of the Church of England. Adjacent is a burying-ground, separated by a railing from the street, and said to contain on one of the tombstones the oldest carved date in America—1642.

In visiting Boston, so many are the memorials of

surrounded by illustrations of history. The Old South Meeting House, where, on the 6th of March 1770, was held the town meeting to remonstrate with the governor against bringing in troops to overawe the inhabitants; Faneuil Hall, a huge brick-building in the market-place, celebrated for assemblages of the 'Sons of Liberty'; Griffin's Wharf, where, on a moonlight night, December 16, 1773, under the popular impulse given by Josiah Quincy, a large crowd went on board the *Dartmouth*, and other English ships, and within two hours poured the contents of 342 chests of tea into the harbour; the level slip of peninsula called Boston Neck, which unites the city with the mainland, and where were placed the British fortified lines in August 1774; the scenery on the western side of Charles River, including Bunker's and Breed's Hills, where took place the memorable action of June 17, 1775; Dorchester Heights, on the mainland, to the south, &c. Among the chief of the objects of curiosity, is the Bunker Hill Monument, occupying a conspicuous situation in the neighbourhood. To reach the spot where this monument has been erected, I crossed the Charles River by a long and low wooden bridge, supported on piles, and passing through Charlestown, arrived at the base of a grassy mound, little more than a hundred feet above the level of the sea. Such is Breed's Hill, which has been selected as the most favourable site for the Bunker Hill Monument. Originally in an open down, the locality is now crowded with houses, which seem to be closing round the hill, very much to the injury of its appearance. The top of the hill has been levelled and laid out with walks, radiating from an iron rail which surrounds the monument. Access to the summit is gained by a staircase. The monument is an obelisk of whitish granite, 221 feet in height, with a square base of 30 feet, whence it tapers to a point. It is a chastely correct work of art—a thing dignified and beautiful in its very simplicity. Many years were spent in bringing it to a complete state, on account of the difficulty experienced in raising the necessary funds for its execution. It was inaugurated by a public ceremonial in 1843, on which occasion Daniel Webster delivered one of his most admired orations.

Accustomed as one is to find everything new in America, Boston, in its historical and social features, presents so much of an old and settled character, that it may be said to stand out alone in its resemblance to a European city. Although constructed principally of wood, no place could be imagined more English than Cambridge, a suburban city, situated to the south of Charlestown, and reached in the same way by an extremely long wooden bridge. This is the seat of Harvard University, an institution dating as far back as 1638, and now, with its various schools, the most important and best attended college in the United States. A glance at Old Cambridge, as it is named, shows us a variety of smart buildings scattered about among trees, with broad winding roads giving access to pretty villas, each with its flower-plot in front, and delightful bits of lawn used for pasturage or recreation. The grass, to be sure, is not so compact or so green as it is in England, the dryness of the climate forbidding that anywhere in America; but the imitation is here as near the original as possible. Driving along one of the broad thoroughfares, our vehicle stops at the gateway of one of the most venerable wooden villas. It is a neat house of two stories, with pilasters in the bald Grecian style of the Georgian era, attics in the roof, and side verandas, resting on wooden pillars. Across the garden-plot in the front, two short flights of steps lead up terrace-banks towards the door. The view in front is open, being across a grassy plain in the direction of Boston. This house became the abode of General Washington on the 2d of July 1775, when he came from New York to take command of the American army; and here he resided part of his time during the

contest in the neighbourhood. At present, the villa is owned and inhabited by Mr H. W. Longfellow, professor of modern languages in the adjacent university, and one of the most accomplished living poets in the United States. Introduced by a literary friend, I had the honour of making the acquaintance of a person whose writings are esteemed in England as well as America, and of seeing the interior of the historically interesting mansion he inhabits. The walls of the room—a kind of library-boudoir—into which I was shewn, were panelled according to an old fashion, and the furniture was of that tastefully antique kind which seemed appropriate to the past and present character of the dwelling. The whole place speaks of other days. Adjoining the house are various tall elms, probably a century old—a highly respectable antiquity for America—and the patch of garden appears to be preserved in the form it possessed when Washington paced across it on that celebrated summer morning when he went forth to put himself at the head of his troops. The spot where this event occurred was in the neighbouring common; here, under the shadow of a large tree, called Washington's Elm, standing at a central point between two cross-roads, he is said to have drawn his sword, and formally entered on command.

It says much for the staid character of the Bostonians, that families connected not only with the revolutionary era, but with the early settlement of the province, still maintain a respectable position in the town, and form what may be called an aristocracy, distinguished alike by wealth and honourable public service. So much has been written of the peculiar attractions of Boston society, that I am fortunately left nothing to say, further than to take the opportunity of offering thanks for the many polite attentions I received from all with whom I had any intercourse. Although only a few days in the city and its neighbourhood, I had an opportunity of making some satisfactory inquiries respecting the prevalent system of elementary education, and of visiting some of the excellent literary institutions with which the intelligent inhabitants of Boston have had the good taste to provide themselves. The Athenæum, consisting of a library and reading-room, was the finest thing of the kind I had seen in America; for, besides a collection of 50,000 volumes, there was a gallery of paintings and sculpture of a high class. Among institutions of a more popular character, may be noticed the Mercantile Library Association, at whose rooms I was shewn a collection of about 13,000 volumes; also, the Lowell Institute, established by a bequest of 250,000 dollars, for the purpose of providing free lectures on science, art, and natural and revealed religion. Some movements were on foot to widen the sphere of intellectual improvement by means of a free library and otherwise: and from the great number of publishing establishments, it was evident that the demand for literature was considerable. 'Everybody reads and everybody buys books,' said a publisher to me one day, and he added: 'every mechanic, worth anything at all, in Massachusetts, must have a small library which he calls his own; besides, the taste for high-class books is perceptibly improving. A few years ago, we sold great quantities of trashy Annuals; now, our opulent classes prefer works of a superior quality.' At the same time, I learned that a number of copies of instructive popular works which I had been concerned in publishing, had been imported for the use of school-libraries; and that there are about 18,000 such libraries in the United States, the amount of books of various kinds required for this purpose alone may be supposed to be very considerable.

Like most visitors of Massachusetts, I made an excursion to Lowell—a manufacturing city of 37,000 inhabitants, at the distance of twenty-five miles north-west of Boston. A railway-train occupied an hour in the

journey, which was by way of Lexington—a small town at which the first shots were fired (April 19, 1775) at the beginning of the revolutionary struggle. The country traversed was level, enclosed, and here and there dotted over with pretty villages and detached dwellings, in the usual New England style. Lowell may be described as a village of larger growth, composed of houses of brick or wood, disposed in straight lines forming spacious and airy streets. Several railways centre at the spot, but there is little noise or bustle in the thoroughfares. All the children are at school, and most of the adult inhabitants are in the several manufacturing factories. The day is sunshiny and pleasant, and a few infants are playing about the doors of neat dwellings in the short streets which lead to the mills. These mills are of the ordinary cotton-factory shape—great brick-buildings, with rows of windows with small panes, and all are enclosed within courtyards, or otherwise secluded from intrusion.

The whole of the Lowell mills being moved by water-power, we agreeably miss the smoky atmosphere which surrounds the Lancashire factories. The power is derived from the Merrimack, a river of considerable size, which is led by an artificial canal from a point above a natural fall in its course, to the various works. In 1853, there were twelve incorporated manufacturing concerns in Lowell and its neighbourhood; principally engaged in cotton spinning and weaving, carpet-manufacturing, calico-printing, and machine-making. The chief and oldest of the various corporations is the Merrimack Manufacturing Company, established in 1822, and possessing a capital of 2,500,000 dollars. Its operations are carried on in six large buildings; it has at work 71,072 spindles, 2114 power-looms, employs 1650 females and 650 males, and makes 377,000 yards of cloth per week. The goods it produces are prints and sheetings. Besides going over the extensive works of this establishment, I visited the mills of the Lowell Manufacturing Company, where I found 800 females and 500 males employed principally in the spinning of wool and weaving of carpets—the designs of these articles being good, with bright and decided colours.

Cotton-spinning and weaving factories are pretty much the same all the world over, and I do not feel entitled to say that there was any remarkable exception in the establishments which here fell under my notice. In each there prevailed the greatest neatness and regularity. The females employed were tidy in dress, yet not very different in this respect from what I had seen in factories at home; for the nature of the work does not admit of finery, and it is only at leisure hours and on Sundays that silks and parasols make their appearance. In the windows of one of the large factories, I saw that flowers in pots were a favourite subject of culture, which I accepted as a token of the good taste of these young lady-artisans. Boarding-houses, generally the property, and under the supervision, of the mill-owners, are situated at a short distance from the factories. These houses are of brick, three stories in height, and have exteriorly the aspect of what we should call dwellings of the middle classes. Of the orderliness of these establishments, their neatly furnished rooms, pianos, and accommodations of various kinds, it is unnecessary for me to go into particulars; neither need I call to remembrance the literary exertions of the female inmates, demonstrated by the *Lowell Offering*, and *Mind among the Spindles*. Among American girls, the general objection to domestic service is not attended with any dislike to working in factories. Many young women, the daughters of farmers, do not therefore disdain to employ themselves three or four years at Lowell, in order to realise a sum which will form a suitable dowry at marriage, to which, of course, all look forward as a natural termination of their career at the mills; and as no taint of immorality is attachable to their conduct while under the roof of

any of the respectable boarding-houses, they may be said to be objects of attraction to young farmers looking out for wives. I was informed that, latterly, a number have come from Lower Canada, and return with quite a fortune to the parental home.

Undoubtedly, the strict regulations enforced by the proprietors of the mills, along with the care taken to exclude any female of doubtful character, largely contribute to the good working of this remarkable system. But as human nature is the same everywhere, I am disposed to seek for another cause for the orderly behaviour and economic habits of the Lowell operatives—and this I believe to be the hope of a permanent improvement of their condition. The sentiment of *hope* is observed to enjoy a vigorous existence in America. Prepared by education, the way is open to all; and so easily is an independent position gained, that none need to sink down in despair, or become tipplers in mere desperation and vacuity of thought. Even in working at cotton-mills, hope has its aspirations in a way not permitted by the customs of England. The factories of Lowell have been spoken of as belonging to incorporations. These are joint-stock companies, established by a charter from the state legislature, and have the validity and privileges accorded only to such companies in England as are established by special act of parliament. To procure such an act, supposing it would be granted to an ordinary manufacturing concern, would cost at least L.500, or more probably L.800; but in Massachusetts, or any other state of the Union, the entire expense of a charter would be thought high at 100 dollars, or L.20; and I heard of cases in which charters did not cost more than L.5. At whatever expense these state-charters are procured, they enable small capitalists to unite to carry out with safety a particular commercial object. The shareholders are responsible only to the extent of their shares, unless they become managers, when they are bound to the limit of their fortune. For anything I know, there may be inherent weakness in the principle of these organisations, but they seem to go on satisfactorily at Lowell, and other places in the New England states; and if they do not command the respect of large capitalists, they at all events do not give rise to feelings of hostility between employer and employed. The stock of the Merrimack Manufacturing Company, which has been stated at 2,500,000 dollars, consists of shares of 1000 dollars each; and I have the authority of Mr Isaac Hinkley, the resident manager, for saying, that the persons employed by the company own more than eighty shares of the capital stock, or 80,000 dollars; and as the market-value of a share is at present 1820 dollars, it is tolerably evident that the concern is paying well, and in good credit. While it may be acknowledged that the management of factories established on this plan is not likely to be so prompt and vigorous as those owned by a single individual, it is surely a matter of some importance to have arranged a scheme, by which operatives have the power of becoming proprietors, to a certain extent, of the mills in which they habitually labour. Whether with the hope of obtaining this distinction, or of investing accumulated capital in other kinds of property, the operatives are depositors to a very great amount in the savings-banks in Lowell. Mr Hinkley mentioned, 'that the Lowell Institution for Savings, had at last report about 1,060,000 dollars of deposits, mostly belonging to persons employed in mills; and he thought the City Institution had about half that amount.' In a published account, it is stated that the number of depositors last year was '6224, nearly all of whom were persons employed in the mills.' Facts such as these say more for the good habits of the New England operatives than the highest eulogy.

All the manufacturing establishments in Lowell concur in issuing a printed table of statistics annually. In the paper of this kind, dated January 1853, the

average wage of females, clear of board, per week, is two dollars; and of males, clear of board, four dollars eighty cents. If we add that one dollar twenty-five cents is the price of board for females, and two dollars for males, a fair idea will be obtained of the wages of labour in the Lowell factories. In English money, the average weekly earnings of a female may be set down at 13s. 6d., and of a male at from 19s. 6d. to 21s.; and, keeping in view that the practice is to secure on an average twelve working-hours each day, English factory-operatives may draw for themselves a comparison between their own position and that of the workers in the mills of Lowell.

It is scarcely necessary to remark, that the prosperity of Lowell, and the agreeable circumstances of the operatives, rest on a somewhat precarious foundation, owing their existence as they do to a tariff which excludes the more cheaply produced goods of England. America has, indeed, strong prejudices in favour of paying high prices within herself for clothing, as contrasted with being supplied more cheaply from a distance; but, after what we have seen of the instability of a protective system in our own country, no one can tell what revolutions of sentiment a few years may bring about amongst so quick and intelligent a people as those of the United States. Were it not for this consideration, I should be inclined to express my surprise that the mill-operatives of Lancashire and Lanarkshire have never struck upon the idea of removing to one or other of the many fields of demand for their labour across the Atlantic.

It appears from statistical returns, that there are now upwards of a thousand cotton manufacturing establishments in the United States, fully one-half being in New England; and of these, Massachusetts has 213, the value of the goods produced in which, in 1845, was above 12 millions of dollars. Considerable as was this item, it formed only a small amount in a general estimate of manufactures in Massachusetts, which reached a total of 115 millions of dollars. Leaving to Connecticut much of the trade of fabricating clocks and other light and ingenious articles, Massachusetts owns many concerns in which the great staples of industry in textile fabrics and metals are produced. Among the trades which it may be said to have made peculiarly its own, at least as regards the eastern states, is that of boot and shoe making. I may state on credible authority, that in 1845, the value of leather tanned was 3,800,000 dollars, and that boots and shoes were produced to the value of 14,799,000 dollars. Probably the value is now as much as 20 millions of dollars; and that anything like such a sum (£4,000,000 sterling) should be realised every year for these articles, in a state with no more than a third of the population of Scotland, is not a little surprising; and the fact is only comprehended by referring to the vastly extended territory over which the manufacturer finds a market. No inconsiderable quantity of the coarser kind of shoes, called 'brogans,' is disposed of for the use of slaves in the south, where manufacturing arrangements are on a limited and imperfect scale; and as these shoes are only one of many varieties of articles made in the free, for sale in the slave states, it is tolerably evident that, so far as material interests are concerned, the northern manufacturers, and all depending on them, have little reason to wish for a speedy termination to slavery. Lynn, a seaport town in Massachusetts, I understand, takes the lead in the boot and shoe trade; the quantity made in that place alone being 4,500,000 pairs per annum, mostly of a fine kind, for ladies and children. Recently, a machine has been introduced for fixing the soles of shoes by means of pegs; the inventor being a person in Salem, in Massachusetts. I was shewn some boots which had been prepared in this manner, and was told that a pair could be pegged in two minutes. One can imagine from all

he hears, that the shoe manufacture must exercise a commanding importance in the state; and if any doubt be left as to the fact, it will be removed by knowing that a few years ago there were as many as fifteen members of the 'gentle craft' in the legislature of Massachusetts.

W. C.

## NINE MONTHS AT VALLONVERT.

BY AN ORGANIST.

My friends in England thought my fortune made, when I sent that letter from Paris, stating how M. le Marquis de Mayall had presented me with the situation of organist to the parish church on his estate of Vallonvert. Indeed I thought the same thing myself when I wrote; and I well remember how, on leaving the hotel of my patron, I rushed into the nearest café and penned the letter, how every second word had a dash under it, and with what a hurried hand I put it into the letter-box at the Bureau de Poste in the Rue de l'Echiquier. The salary, to be sure, was not much; but then 750 francs per annum looked a great deal upon paper, and my kind uncle and aunt in their Suffolk farmhouse little knew how that important sum stood for only thirty good English sovereigns. I knew the fact myself; but my superior knowledge availed me little, for I was but a lad, fresh from the class-rooms of the Académie Royale, and 750 francs seemed to me, if not a luxurious, at least a respectable income.

Vallonvert lay in a southerly direction, about eight-and-forty miles from Paris, and the nearest railway station was at the post-town called Charmenteuil, four leagues from my destination. It was evening when I alighted from the train. I could not afford eight francs for a fiacre; and although it was already late, and unusually warm even for June, I was compelled to walk the whole distance. It was a dreary, hilly road. There had been no rain for more than six weeks, and my boots were covered with white sandy dust at every step. Night came on, lit faintly by the stars; and it was near midnight when I reached the little silent village of Vallonvert, and knocking up the sleepy host of a small auberge, was installed in one of the narrowest and dirtiest little cribs imaginable.

I awoke the next morning to an agreeable surprise, for on looking out of the window, I saw at a glance that the village was charming. There were hills and vineyards all round—a forest close by, and the spire of a church peeped above the trees. I hastened down to a mean room with whitewashed walls and sanded floor, with the words 'Salle à Manger' painted on the door. The landlord was officiating as waiter to a couple of soldiers, who were intently breakfasting, and drinking his sourest Chablis as if it had been the richest vintage of Burgundy.

'Tell me, monsieur,' said I, 'is yonder church Saint Celestine de Vallonvert?' It was. Would monsieur please to take breakfast? But I was too much excited to think of breakfast just then. I went quickly from M. Meunier's salle à manger, and through the village, with the steeple still visible before me, nor paused till within the little church-yard wicket, half-way up the hill. It was a lovely quiet spot, dotted with iron crosses, all hung with wreaths of white and yellow immortelles, and planted here and there with trees and rose-bushes. There was a modest white cottage, quite fenced in with acacias and lindens, at the further end, close beside the gray old church; and in one

corner stood a grand white marble monument with cast-iron gates, through which could be seen the interior fittings of a tiny chapel, an altar, a crucifix, and a large pair of candlesticks. A cypress was planted beside the tomb, and an inscription on the pediment told how the father of M. le Marquis was there buried; but not a single garland decorated the grave. Somehow, the sight of this formal monument made me sad; I turned towards the open doorway of the church, and entered slowly.

The interior was spacious, the rafters high, the walls whitewashed, weather-stained, and cheerless. A few benches of dark wood and two or three chairs occupied the aisle. Before one of these a boy was kneeling, with his face buried in his hands. A plain oaken pulpit; a richly carved confessional of mediæval date; an altar decked with a few tawdry images and artificial flowers; an apparently old but large organ over the door; and half-a-dozen wretched engravings, representing the martyrdoms of St Justine and St Lawrence, the communion of Ste Therèse, the scourging of St Gervais, the apotheosis of Ste Celestine, and a Holy Family, were suspended against the walls. These, with the exception of a font and an iron stand for votive tapers, were all the decorations of the church. Everything looked blank and poverty-stricken, and the echo of my own footsteps struck painfully on my ear as I ascended the little narrow staircase leading to the organ-loft. The doors of the instrument were open, and the keys thickly covered with dust. A tattered fragment of one of Mozart's masses was on the music-deck; one or two of the stops were still out, and yet it seemed as if no hand had touched those dusty keys for many weeks. Listlessly, I took the vacant seat, and passed my hand along the notes.

'I can blow, if monsieur desires to play,' said a plaintive voice at my elbow. It was the boy whom I had seen kneeling below. He was a pale lad, of perhaps thirteen years of age; his features were not handsome, but his dark eyes were fine and full of meaning, and his long hair hung almost to his shoulders. His blue rustic blouse became him well, and his appearance interested me.

'What is your name, mon enfant?' I asked.

'Charles,' he replied; and added with a sigh: 'I used to blow always for Monsieur de Calandre.'

'Who is Monsieur de Calandre, Charles?'

'Alas! monsieur, he is dead. He died two months ago. He is buried in the church-yard yonder. He played upon the organ many years. Shall I blow, monsieur?'

I nodded, and as the boy went round to the back of the organ, I saw that he was lame. I felt very melancholy. The first chords I struck sounded strange and mournful, and wandered echoing round the church. I thought of the poor organist who had last awakened those tones, and longed to know his history. Insensibly, I found my thoughts connecting themselves with the harmonies I was playing; a solemn requiem grew under my fingers; gradually, I put on the whole power of the instrument, and filled the church with its deep sound. Then I caused that power to die and fade away, as if rising far into the heavens—slower, fainter, sweeter, till the last long note was hushed, and the last reverberation stilled. Then I rose and looked into the church; an old white-headed

and stick beside him, and his hands resting on his knees, in the attitude of listening.

'It is Monsieur le Curé,' said Charles in a low voice. I looked attentively at the boy, and could see that he had been weeping.

'What is the matter, Charles?' I asked. The lad blushed.

'It—it was the music, monsieur,' he said, turning away; and I was vain enough to feel flattered by this simple tribute to my playing. I introduced myself to M. le Curé, who kindly shook me by the hand, and said that he had heard me with considerable pleasure. After a few words of casual conversation respecting M. le Marquis, my journey, and the situation of Vallonvert, the good priest invited me to breakfast with him.

'I was just about to seat myself at table, Monsieur Warrington,' he said, 'when I heard the organ pealing in the church. I knew then who had arrived, and I hastened to welcome you.'

'Monsieur le Curé'—I began, with a blush and a bow.

'Do not call me by that title, my son,' he interrupted; 'call me Father Ambroise.' And so I called him Father Ambroise ever after, and the time soon came when I could scarcely have loved a father better.

The old curé occupied the white cottage in the church-yard. His rooms were very barely and poorly furnished, but exquisitely clean. An old housekeeper and a mastiff were all his household; a few books of devotion, all his library; a thousand francs per annum, all his wealth. Marie had prepared for my company during her master's absence, and my welcome was most hospitable. During the meal I made some inquiries respecting my predecessor, and Father Ambroise confirmed what the boy had told me.

'Monsieur de Calandre,' he said, 'was a broken, but not an aged man. He came here fifteen years since, and held the situation to which you have succeeded until the day of his death. He was a gentleman—a gentleman, Monsieur Warrington, and one who had not been used to poverty. He had some sorrow on his heart, but he was silent—silent and proud. He died very suddenly. You had better occupy his apartment, monsieur; it is the only fit lodging for you in the village. I will shew it to you by and by.' So, after breakfast, we went there. As I passed the church-yard gate, I saw the boy again, and pointed him out to the curé.

'Ah, poor Charles!' he said gently; 'he has been lame from his birth, and he has neither father nor mother. Poor Charles! he is a good child.' The late organist had rented a small but comfortable chamber, over a shop in the village, and in this room I was speedily installed. There were many little tokens of its last occupant about; some papers—I destroyed these the instant I found them—some French and Latin verses; a little pocket volume of Homer; a rusty pistol, and a faded miniature of a young lady, which I suspended over the fireplace. At first, these things shocked and disturbed me; but soon, I am ashamed to say, the natural insouciance of youth effaced those first impressions.

This country-life delighted me beyond measure. Every morning I would wander away with a book in my hand, and traverse hill and dale and forest with untiring rapture. Educated all my life in cities and schools, this freedom, and the scenery around Vallonvert, filled the day with enjoyment. Sometimes I went out with a gun borrowed from my landlord, and sometimes, with a rude fishing-rod of my own manufacture, I have lingered for hours on the banks of the little river that skirted the domain of M. le Marquis de Maxwell. Often, on a summer evening, I have not

returned till the angelus was ringing; and often, too, when the hour of vespers was past, I used to sit in the old church, and play till the moonlight came streaming in upon the keys. At such times, Charles would stay and blow till midnight if I chose; and when I rose to go, would say: 'Déjà, monsieur?' with a sigh.

'The music is so much more beautiful at night, monsieur,' he once said; 'I always feel then as if it came from heaven, and the blessed Virgin were listening up above.' Very often I played a game of chess in the evening with Father Ambroise, or lent my assistance in the culture of his little garden. Then he gave me Latin lessons twice or thrice in the week; and such little offices were always being exchanged between us. It was a happy time; but I soon felt the want of books, and the few the good priest possessed were by no means to my taste. Religion was the only shadow in our intercourse. I was Protestant—he tried to convert me. He was simple, earnest, and sincere; he argued, lent me breviaries and pamphlets—all the books of devotion he could find; but it was of no avail. I respected, I loved him; but I could not believe with him. His faith was not my faith, and he lamented it bitterly. In time he relinquished the hopeless endeavour, and the subject was mentioned no more; but I could see that he still grieved over it, and still the shadow was between us. One day I found him kneeling before the altar. He rose and turned towards me.

'Do not go, my son,' he said, perceiving me about to retire—'do not go. You have come to play—I came to pray. My prayers were for you.' I felt a pang of sorrow as I watched him going feebly across the church-yard, and back into his cottage, for I fancied that his steps and voice were weaker lately than when I first arrived in the village. He was an old man, and his duties were not light. He performed three services on Sundays, fast-days, and festivals, and every day we had matins and vespers; but my assistance was never required during the week-days, unless on particular occasions. Our congregation, even during the Holy-week, or on the festival of the Annunciation, never exceeded forty persons, and generally numbered about a dozen. We had no choir, so I trained some of the young boys in the village to chant a few simple movements for the mass; an aged peasant acted on Sundays as our sacristan; and the grandson of this old man officiated as acolyte. The organ was tolerably good, and bore the date of 1785. Though somewhat harsh in the reeds, it contained a tolerable Cremona stop and a flute of delicious quality; the pedal pipes were deep and powerful, and the diapasons sweet. It was built with three rows of keys, and was, on the whole, a much better instrument than one might expect to find in so mean and unfrequented a place. I heard that the father of M. le Marquis, being exceedingly fond of church-music, had purchased this organ, and sent it hither from Paris, and that it had been his chief delight to come down from the château, and play upon it during the summer evenings when he visited his estates.

The children soon learned to sing very sweetly and correctly; the organ, Father Ambroise was pleased to say, had never been under such good hands before; and by and by, as the fame of our services spread, Ste Celestine was frequently honoured with the presence of some towns-people from Charenteuil during the high-mass on the Sundays. I confess that this success elated me not a little; old Marie became more particular than ever in dusting the seats, and gathering fresh flowers for the altar; and I observed that the sermons of Father Ambroise aspired to a more flowery style, and were sprinkled with an unwonted supply of Latin quotations; but I liked his old homely discourses, with their simple heartfelt eloquence, far better.

Vallonvert was inhabited only by the vine-dressers on my patron's estate. Though better paid than the generality, these peasants were miserably poor, and

toiled from daybreak to nightfall. Poor creatures! they had but little time to pray; yet on Sundays it moved me to see their earnest devotion at high-mass, though at first I found it difficult to reconcile this morning mood with their evening gaiety, when young and old met to dance and sing, to the accompaniment of a rude cornemuse; or sat outside their cottages, playing games of chance, and drinking the sour wine of M. Meunier's cellarage. But these extremes belong peculiarly to the French character, and I soon became accustomed to them.

I had not been long at Vallonvert, when we were visited by a heavy thunder-storm. It came on at night. I was awakened from a profound sleep by the fury of the elements; and finding it impossible to rest, I rose, dressed, lit a lamp, and tried to read. Several times I paused and listened, for every now and then, amid the lulls of the tempest, I fancied I heard the pealing of a bell. At last I extinguished my light, opened the casement, and listened attentively. The rain and wind dashed in my face; this time I could not be mistaken.—It was the bell of Ste Celestine's beyond a doubt! I wrapped myself hastily in a travelling-cloak, made my way softly out of the house, and in a few minutes reached the church-door. It yielded to my touch; the candles were lighted upon the altar, and Father Ambroise was kneeling before the host, and chanting, in a feeble voice, scarce audible above the external tempest, the service of the mass. At first I felt as if it must be some ghostly delusion. Slowly I advanced up the aisle. There was no creature there save the priest himself, and, excepting in the immediate vicinity of the altar, the whole building was in the deepest gloom. Just then, Father Ambroise turned and saw me. He smiled, and I was reassured. When the mass was concluded, he told me that he performed a service whenever there was a storm, to entreat the intercession of Ste Celestine that the vines might be preserved from injury. For this act of piety he received from M. le Marquis a small present, in addition to his annual stipend. I have since learned that this is a frequent practice in Burgundy, where the prosperity of the landowners is entirely dependent on the vintage; but I had never heard of it before that night, and the effect was strange and solemn.

I had been nearly five months in my situation, and the winter had quite set in before I saw even the outside of the Château de Mayall. As I have before observed, I frequently fished in the streamlet that skirted what in England we should term the home-park, but the house itself was so completely bowed in with trees, that not a chimney was visible. The marquis had not visited the place more than once or twice during the twenty years that he had possessed the title, and I had frequently heard how Le Capon Duplaisset and his wife were the only inhabitants of their master's residence. Duplaisset was one of the Old Guard of Napoleon; he had served at Marengo and Austerlitz; he had suffered all the horrors of the Russian campaign; he had been one of the first to welcome his Emperor from Elba, and one of the last to fly upon the field of Waterloo. I often met this old soldier near the church on Sundays, where his tall, spare figure, his long white moustache, and his little cross of the Legion of Honour, made not the least imposing part of our congregation at high-mass. At length I happened, one bright cold morning, to meet him on my way home from the matin-service, and was so fortunate as to receive the long-desired permission to visit the château. So we walked on side by side, and the hard road, glittering with hoar-frost, rung sharply to the sound of our footsteps. The trees were quite leafless, and the vine-fields deserted. Now and then we passed a countryman bending under a heavy load of firewood, or heard the quick blows of the axe among the pines in the forest.

'You see, monsieur,' said the caporal sententiously, 'I have fought against your country, but I bear no enmity to you or to your generals. You are welcome to my house and my table.' He spoke as if he was the marquis himself.

'Under what general did you serve, mon capitaine?' I inquired. Duplaisset liked to be called mon capitaine, and all the village indulged him in this foible.

'My division was commanded by the father of Monsieur le Marquis,' replied the soldier. 'He was a brave officer, and the Emperor'—here he touched his hat—'the Emperor loved him dearly. But we are at the château, monsieur—le voilà.' The house was large, old, and gray, and was surrounded by a spacious courtyard, which we entered through a great wooden gate studded with huge rusty nails. Long grass, now withered by the frost, was growing up between the paving-stones; and the water of the fountain was frozen to a solid mass in the basin, and hung in fantastic icicles from the broken jaws of the old stone lions in the midst. Passing through an oaken door with a single step, I found myself at once in a long narrow hall with a rafted roof, oak panelled walls, and a floor of the same wood, retaining now but little of its antique polish. At the further end, there was an immense fireplace, richly carved and decorated, and the iron dogs were ready piled with fuel, as if for the coming of the master, who never cared to visit the old place. The next apartment, carved and panelled precisely like the former, contained some fragments of armour, some chairs and footstools in the renaissance style, and a couple of rare ebony presses. The third was the dining-hall and picture-gallery, where were hung the cracked and faded portraits of a generation long passed away. Here, 'clad in complete steel,' frowned Gaston de Mayall, a constable of France under Louis XIII.; here an heir who fell in the Crusades; yonder hung the last memorial of a celebrated beauty of the house, now crumbling into dust; and that withered courtier with the long flowing wig and white satin waistcoat, was Polidore, first Marquis de Mayall, who was elevated from the rank of baron by the letters-patent of the Grand Monarch. The Caporal Duplaisset was profuse of these historical details; and it filled my boyish imagination with awe to hear of the chivalry and beauty that had lit up these old halls with glory in the times gone by.

In the upper rooms there were great carved beds, with stiff tapestried hangings whose colours had faded away to sickly tints, and whose gold inwoven threads were black and tarnished. Here were more presses and armoires, and immense carved chairs and tables; but what surprised me most, was to find the floors in this story paved with small red tiles. I must not forget, either, that I saw an ivory or ebony crucifix in every bed-chamber; and that a small oratory, with its altar and cushion, and window of old stained-glass, was attached to one or two of the largest. Descending from this suite of apartments by a wide gloomy staircase, we came to the library, at whose dusty folios, behind their impenetrable fence of tarnished wirework, I cast many long and anxious glances. The caporal then led me through the dark kitchens, dungeon-like and damp; and finally conducting me up a narrow back-staircase, ushered me into a cheerful room with a blazing wood-fire, and windows that commanded a pleasant view of the garden and park. Here Madame Duplaisset was busily knitting; a large dog was sleeping in the deep embrasure of the casement; the soldier's gun and sword were suspended over the fireplace; a string of beads and a missal, with a pair of large spectacles, were lying on the old lady's work-table; and a fragrant steam of soup proceeded from a little stew-pan on the fire.

'Jacquette,' said the old militaire, twirling his moustache with his left hand, 'I have the pleasure to

introduce to you Monsieur Varrinton, an English monsieur, who is very great'—très-fort was the expression he used—'upon the organ.' The poor old lady, who was a cripple, and whom I had never seen till then, smoothed her apron nervously, and bent her head.

'Dame! mais m'sieur est le b'en'nue!' And such was my first visit to the Château de Mayall, and my introduction to Madame Duplaisset.

I frequently paid a visit to the old couple after this event, and always received a hearty and respectful welcome. The caporal was fond of relating his military adventures; and although his description of the campaign in Egypt and the burning of Moscow, or his famous anecdote of how the Emperor Napoleon, on the field of Arcola, transferred the cross of honour from his own breast to that of Antoine, Antoine Duplaisset, then in the ranks of the Old Guard, and said: 'Mon enfant, you took those colours bravely: vive la gloire!'—though these tales were stale enough to the inhabitants of Vallonvert, they were new and delightful to me.

Madame Duplaisset was likewise rich in anecdote; but hers were all of the ancient glory of the family De Mayall—how its lords had fought for the holy sepulchre, and how princes of the blood had, in the old times, visited the château, and hunted by torch-light in the forest. To all these stories I was an eager and a patient listener; for in the dearth of books, I found some food for thought in the military and historical reminiscences of this old couple. In return for the entertainment which they thus afforded me, I brought them game and fish, and I was not too proud to remain occasionally and partake of madame's savoury ragouts.

During one of these little festivals, to which I had contributed a bottle of M. Meunier's best Chambertin, I heard a ghost-story, which I will endeavour to repeat as faithfully as my memory will permit.

'My tale is connected with the church yonder, Monsieur Varrinton,' said Madame Duplaisset, 'and that is the reason why I tell it to you; for I would not relate it to many, especially during the lifetime of Monsieur le Marquis. Eh bien, you must know, then, that our master's father—the same who purchased the church-organ—was a general of division in the Grande Armée; a fine, proud, passionate man, but very gracious when he was not angered, and the bravest of the brave. He had two sons—Monsieur le Comte Leon, the eldest, who was passionate like his father; and Monsieur le Comte Auguste, the younger, a cold studious boy, and the same who now enjoys the title and estates. At the time of which I speak, their ages were about fifteen and seventeen. Monsieur le Marquis was away in the wars, and his sons were left in the château with their tutor, Monsieur l'Abbé, and about a dozen servants. I was a femme de chambre here then; and I can tell you that we cared little enough for Monsieur Auguste, but as for Monsieur Leon, we would have died for him! Well, at last something began to be whispered about the village and in the servants' hall; but the tutor knew nothing, and none of us would have betrayed Monsieur Leon for the wealth of the king! The secret was this: the daughter of a vine-dresser in the village had bewitched our young master avec ses beaux yeux. They were seen walking together; and certainly Monsieur Leon was out oftener and longer with his gun than ever he had been before. However, it came at last to the knowledge of Monsieur l'Abbé and of Father Eustache, then curé to Ste Celestine's; and one day they called Monsieur Leon into the library, and charged him with it before Monsieur Auguste, his brother. I was in the ante-room at the time, with one or two of the others, and we listened tremblingly to the high voices within. All at once we distinctly heard Monsieur Leon say: "It is false, messieurs! I am a gentleman, and the good name of the humblest peasant on this estate is as dear to me as my own! It is false! and sooner than this

scandal shall be repeated, I will marry her!" And immediately the door was flung wide open, and Monsieur Leon, with his cheeks flushed, his hand in the breast of his waistcoat, and with the air of a king, strode out of the library, across the hall, and straight away into the park.

'Well, this passed for a mere idle threat; but soon, whether by bribes or entreaties, he won over Father Eustache so as to promise to perform the marriage-service between Pierrette and himself; and on one tempestuous night, when the rain was flooding the fields, and the wintry wind howling through the forest, Monsieur Leon left the château by a side-entrance, and went down to the church, where, sure enough, there was Father Eustache and Pierrette, and that designing man, her father, all ready waiting for his arrival, with the candles lighted, and the book open upon the altar. So the service was performed, and the ring just placed upon the finger of the bride, when the door burst violently open, and Monsieur le Marquis rushed in, followed by his younger son, the tutor, and some of the men-servants.

"Scélérat!" cried Monsieur le Marquis in a terrible voice, "what wouldst thou do?"

"Mon père," said Monsieur Leon, putting the girl aside, and turning upon his father as proud as himself—"you are too late!" Stung with fury, the marquis dealt him a fearful blow with his powerful arm, and in an instant the young man was lying on the ground with the blood pouring from a wound in the temples. His head had struck against the sharp stone altar-step, and in a few minutes he was dead. I have heard those say who followed him to the church, that Monsieur le Marquis raved and wept till the roof rang with his cries. He was brought home insensible upon one shutter, and the corpse of his son upon another. Poor man! he never recovered the events of that night, and he died shortly after of pure grief, monsieur.

'But this is no ghost-story, Madame Duplaisset.'

'Pardon, monsieur!—the spirit of the poor youth will not rest. He was buried in the chancel of Ste Celestine; he still walks the church in the moonlight, and even glides about the forest; for our neighbour Jean has seen him! Do not shake your head, monsieur, for I am not the only person who believes the tale. Monsieur le Marquis never comes to the château, for fear of meeting his brother; and, indeed, it is said that he has cause to dread his spirit, and that he played the traitor to his brother, and betrayed him, to win his father's favour. But we have all our sins; the Virgin pray for us! And, Monsieur Varrinton, sometimes on a stormy night he comes and knocks for admission at the courtyard gate. I have heard it myself, and that not a month ago!'

Shall I confess it? After hearing this tale, I never practised again by night in the organ-loft of Celestine's.

The spring-time came, and it brought me an English letter, informing me of the dangerous illness of my good uncle, and desiring my instant return to my native country. On the same day I wrote to M. le Marquis, tendering my resignation; and after walking up to the château to bid farewell to the good caporal and his spouse, I went to the church, collected my music, and looked with a sigh upon the dear old keys I was to touch no more. As I came down into the aisle, I found poor Charles standing near the door.

'Adieu, monsieur,' he said in a broken voice, 'I hear that you are going to leave us.'

'Adieu, Charles,' I replied, 'do not forget me!' and I placed a five-franc-piece in his hand. He turned his head away and said no more. In this attitude he remained till I entered the curé's cottage, and when I came out again, he was gone. Dear Father Ambroise! he wept, and gave me his blessing, heretic as he deemed me! He is dead now, and buried in the little church-yard where he resided during life.

When I reached England, my uncle was no more. I

inherited from him a small property, which has enabled me to relinquish music as a profession; but more than once I have indulged myself in an autumn visit to the village and church of Ste Celestine de Vallonvert.

## THE MONTH:

### SCIENCE AND ARTS.

As the 'season' advances towards its close, our learned societies finish off their sessions with more or less of éclat, and shew that theirs is not a mere nominal existence, ere breaking up for the long vacation. The Royal Society wound up with sundry ingenious papers on subjects which, though not easy to popularise, yet have an important scientific value and application. Among them was Colonel Sabine's résumé of certain phenomena of terrestrial magnetism, shewing by diagrams the complete identity of the phenomena observed at places distant from each other by the whole diameter of the earth—to find the cause is now the grand desideratum. The Society have filled up the blanks in their list of foreign members by choosing as *confrères* Charles the geometer, Wöhler the chemist, and Von Baer the physiologist. The last is a Russian, and second to none in his special branch of science; and the appearance of his name on the distinguished list may be accepted as another instance, if such be wanted, that science is of no nation or country, but cosmopolitan. And carrying out their improved mode of election, which makes it a real honour to become one of their body, the Society have recruited their ranks by fifteen new members who, we may hope, will worthily keep up the reputation of the incorporated savans. The Geographical Society have given one of their gold medals to Admiral Smyth, for his numerous marine surveys, and his able work on *The Mediterranean*; and the other to Captain Maclure, for his discovery of the North-west Passage. It will gladden the gallant captain to receive this recognition of his enterprising services when he returns to England next autumn. The Civil Engineers have had another discussion about the prevention of smoke in furnaces, which, by pointing out defects, and suggesting improvements in existing contrivances, will help to promote the object in view. Having regard to the actualities of their profession, they have given a hearing to a paper on the 'Fatigue and consequent Fracture of Metals,' the drift of which is, that iron beams, if subjected to heavy and intermittent loads, become *fatigued* by the constant strain and recovery, and at last break from sheer exhaustion. The same holds good of locomotives and other machines which are liable to be overworked; and in this theory we have an explanation of many inexplicable accidents. A small apparatus for making infusions, or extracts of dyeing or colouring matters, the invention of M. Lorys, exhibited at one of their late meetings, is worth notice. The substance to be operated on is placed between two diaphragms in a cylinder; the liquid is then forced upwards from below, and when it reaches the top, it is made to descend again by turning a cock. This double passage through the same mass is said to carry with it all the available extract; no unimportant consideration in manufactories, to say nothing of the making of tea and coffee—an operation which the apparatus performs to perfection. We hear that it is to be used at the Sydenham Palace, where it will produce 1000 pints of tea or coffee in an hour.

Photography continues to be, as for some time past, one of the most progressive arts. A report by the Photographic Society, informs us that the *Hecla* steamer, during her late survey of the Baltic, carried a photographer, who, while the vessel was going ten miles an hour, took collodion views of parts of the coast, the

headlands, and fortified places. These views are so well defined as to be highly satisfactory; and what is more, they give the relative dimensions of heights better than can be done by the hand of the artist. Views of the fleet sailing from Spithead, were taken in a similar way, and there will be no lack of others from the East; for some of the Sappers and Miners have been instructed in the art, and will take pictures under direction of their officers. A difficulty is removed by the discovery that collodion-plates may be made to retain their sensibility four or five days, instead of four or five minutes, as hitherto. This is effected by dipping the plates in a bath containing a solution of nitrate of zinc and of silver. The possibility, too, of converting photographs into engravings, has been further demonstrated at Paris, in various ways, of which the one proposed by M. Baldus is thus described by the authority above mentioned:—

'A copper-plate impressed with a photographic image upon bitumen, and prepared for etching—as in Niepce's process—is attached to the positive pole of a Bunsen's voltaic pile, and placed in a saturated solution of sulphate of copper, with another plate of copper connected with the negative pole. The lines of the image—the parts unprotected by the bitumen—are dissolved out in the voltaic action, and the copper precipitated in the other plate, as in the electrotype process. When the lines are bitten deep enough, the connections with the battery are reversed, and then, consequently, an electrotype impression in *relief* is deposited upon the original plate. It is requisite that the voltaic action should be very moderate; a deflection of the electrometer amounting to five degrees is found sufficient.'

The Society of Arts have appointed an 'Industrial Pathology Committee,' who are to inquire into the 'accidents, injuries, and diseases incident to various bodily employments.' This is a great subject; and if the Committee will take up its several branches *seriatim*, and follow them to definite conclusions, they cannot fail to do good. It will not be the first time that the question has been taken up; for French and English writers have examined into it, and published their results, which form valuable data for renewed investigations. The Trade Museum, in process of formation by the Society, is getting on favourably: the Lords of the Treasury have issued an order that all produce and manufactures arriving from abroad for it, shall be sent direct to the Museum, and there examined, duty free. The Society's Educational Exhibition, too, is now open at St Martin's Hall: it places on view the *matériel* of teaching, as used in schools in different parts of the world; and when we consider that means and appliances such as these lie at the root of all the Society proposes to accomplish, we cannot fail to see how deeply art and science are interested in an attempt to find out the best instruments of knowledge; while, at the same time, individuals experienced in the question of education are brought together. The newspapers have already announced that government is about to establish a university at Melbourne, the salary of the professors to be £1,000 a year, and have appointed a commission of first-rate savans to examine the candidates for the professorships. We understand that the number of eminent men applying for these chairs has been quite beyond expectation. Our School of Mines here, in Jermyn Street, has just lost one of its ablest professors, in the person of Edward Forbes, who now fills the chair of Natural History in Edinburgh: he is a loss to London in more senses than one. His place in the School of Mines is occupied by Mr Huxley, a young and promising naturalist, well known, among other researches, for the excellent use he made of his three years' opportunities in the late surveying-voyage of the *Rattlesnake*.

Dr Arnott having taken effectual means to make his improved smoke-consuming fireplace public, by

showing and explaining it at a meeting of the Society of Arts, we may add to our former notice of this useful contrivance, that the space between the grate and the hearth is filled by a close iron box, inside of which is a movable bottom, made to rise and fall by a rack and lever. This box being filled with coal, the fire is lighted in the grate above it; and as the coal burns downwards, so is the bottom to be raised till all is consumed. Due provision is made for refilling and other requirements. The principle, as admitted by Dr Arnott, is not new: he claims only to have been successful in his adaptation of it. We have no doubt that the result will be beneficial, if admirers do not spoil all by overpraising and promising too much. There is something further to be said also about Dr Stenhouse's respirator: this instrument can now be produced in a thoroughly efficient form for seven shillings, and may be kept in use for a long time, as the charcoal, when saturated, needs only to be exposed to heat for a few minutes to become as serviceable as before. Four of these respirators have been sent out with the Niger Expedition just sailed, that they may be tested in the noxious malaria of the African coast.

The underground telegraph-wire from London to Liverpool is completely laid, and in such good working-order, that the latter port and Manchester have been holding direct communication with Paris. By August next, if all go well, they may have a telegraphic talk with Madrid, and in a few months more with Cairo, for a telegraph cable has been spun at Greenwich in one single length of 110 miles, weighing 800 tons, to be laid down across the Mediterranean from the Sardinian coast. At this rate, we shall soon be getting news from India within the day. Neither are we to be backward in the West: Lieutenant Maury reports as one result of the American survey of the Atlantic, that the flat ridge said by old Dutch navigators to extend all across the ocean, does really exist, and at a comparatively moderate depth. Hence it is presumed there will be no unconquerable difficulty in laying a wire from the west of Ireland to Newfoundland. After this, one must doubt of nothing in which electricity is concerned.

The joint oceanic survey by the British and United States' governments is not to be a mere formal dilettante operation, but such as will best promote the interests of science and navigation. The appointment of Captain Fitzroy as chief of a staff for the classification and reduction of the meteorological observations that may be taken, is a proof that practical results are not to be lost sight of. Apropos of navigation, the fact is not so widely known as it ought to be, that since the stir made about great circle sailing, the Admiralty have published tables for that particular branch of nautical science, by which it is rendered as easy as any other employed by mariners. They are sold at a low price; and such is their importance, that they have been promptly taken into use by the governments of the United States, France, Belgium, and Russia.

Those who have a mind to exercise their inventive genius, will find an advertisement in the *Times* offering a thousand pounds to whomsoever shall, within a twelvemonth, discover a really satisfactory method of making paper fit for writing and printing, of some material which is *not* rags. We think it not unlikely that the prize will be carried off before the year is over. It is meanwhile worthy of notice, that a movement is making for the development of the great powers of India, to produce a flax of short fibre, which may be found economically applicable to the manufacture of paper. Some aid of this kind is needed to a degree beyond what many are aware of, as the increasing price of the article is threatening many popular works with ruin, and undoubtedly many of the less decisively successful cheap periodicals must be extinguished if the price be not lowered, either through

greater abundance of material, or reduction of the duty.

In Paris, the Bréant legacy of 100,000 francs for any one who shall discover the cause and cure of cholera, has inspired some theorists to compete for it, but as yet without success. One says that ozone is the developing cause of cholera in men and certain quadrupeds, while at the same time it is developed by the human organism; and that an excess of ozone in the atmosphere produces disease in plants containing sugar, glucose, and secula—such as the vine, beet-root, and potato. Seeing that nearly a hundred observers here in England, and on the continent, from the Mediterranean to the Baltic, are taking observations of ozone twice a day, and sending the results to Schoenbein for discussion, we shall perhaps get to know whether this potent atmospheric principle is or is not harmful, as represented.

The great comprehensive measure for the drainage of London is still, unfortunately, in the region of debate, and likely to remain there. If we had but the long-talked-of open quays along the Thames, the difficulties of the journey to the Crystal Palace would be materially and pleasantly diminished. The suggestion has been thrown out, that if all the sewage of the metropolis were conveyed far enough to *débouche* in salt water, the saline matters would tend to consolidate the refuse by a process of natural chemistry, and at a small expense. The product would be more than usually valuable, as marine manures are said to be specifics against the vine-disease, and highly beneficial to plants generally. While waiting for this suggestion to be reduced to practice, we would call attention to the fact, that a company at Manchester has for some time been making guano from the sewage and other noxious waste, and with good profit.

In these days of gold-digging, when we still hear of monster-nuggets from Ballarat, and of discoveries of the precious metal at the Cape and in the mountains near Adrianople, we may naturally expect increased applications of it in the industrial arts. Something ingenious in this way has just been done at Paris by M. Levot, who, taking advantage of the property phosphorus is known to possess of precipitating metals, forms moulds of this substance by melting it in glass vessels of the required shape plunged in a hot-water bath. After cooling, the glass may be removed by breaking, when the phosphorus moulds are ready for use; which use consists in placing them in a solution of perchloride of gold, whereupon a deposit of the metallic particles immediately begins, and may be continued until the article is of any desired thickness. The phosphorus mould is then removed in the same way as it was formed—by melting—and the gold is ready for the burnisher.

M. Pouilly has a galvanoplastic method of treating silk, by which gilded dress or drapery is produced of unequalled magnificence. He metallises the silk, throws down upon it a coating of copper, and last of all, a coating of gold; and so perfectly is this accomplished,

that the texture, while appearing to be metallic throughout, retains all its flexibility. The richness of effect is said to be truly marvellous; and we may yet hear of a *Field of the Cloth of Gold* far surpassing that which old chroniclers tell us of.

M. Provenzani, of Rome, puts forward a fact not without its value to those who are investigating the phenomena of electricity—that by covering the conductor of an electrical-machine with a thin sheet of gutta-percha, much larger sparks are obtained than with a conductor prepared in the usual way. It would appear that gutta-percha is a most effectual check to dispersion. And makers and users of steam-boilers would do well to examine into Mr Normandy's statement—that the spheroidal state of water may be produced in a boiler not heated before the water is put in. If this be true, the many 'mysterious' explosions will be mysteries no longer.

#### ON THE CLIFF-TOP.

FACE upwards to the sky,  
Quiet I lie;  
Quiet as if the finger of God's will  
Had made this human mechanism still,  
And the intangible essence, this strange 'I,'  
Went wondering forth to His eternity.

Below—the sea's sound, faint  
As dying saint  
Telling of long-spent sorrows, all at rest;  
Above—the unscared sea-gull's shimmering breast,  
Painted a moment on the dark-blue skies—  
A hovering joy, that, while I watch it, flies.

Alike unheeded now  
Thou Grief, and thou  
Quick-winged Joy, that like wild bird at play  
Pleasest thyself to flit round me to-day;  
On the cliff-top—earth dim, and heaven clear—  
My soul rests calmly, above hope—or fear.

But not (Thou, God, forbid!  
By Him whose lid  
Stainless looked up to Thee, then tear-stained down  
On Lazarus' grave and Solyma's doomed town),  
Oh! not above that human love divine  
Which—Thee loved first—in Thee loves all of Thine.

Is't sunset? Keener breeze  
Blows from the seas;  
And close beside me, vision-like, one stands  
With her brown eyes and kind extended hands.  
Love! we'll go down together, without pain,  
From the cliff-top, to the busy world again.

The present number of the Journal completes the First Volume, for which a title-page and index have been prepared, and may be had of the publishers and their agents.

# CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 26.

SATURDAY, JULY 1, 1854.

PRICE 1½d.

## LAST APRIL-DAY:

### A POULTRY IDYL.

It is a pleasant sunny Saturday—no less than April-day in the present year. I am writing in a very quaint, stone-floored, high-latticed room of ancient date, when a lady steps into its still shadows, and asks me to accompany her in her afternoon's drive, to a little country town some five miles off; our return to be by a different route, and to include rest and tea in a village amid lovely scenery. I gladly consent, for I have been working hard the week through, and need a holiday for both body and mind. So I close my books, put by my papers, lock with a jailer-like key the door of the quaint room assigned to me as a study during my temporary stay with an aged relative in this noble building; then, after a few paces up and down in a sunny cloister that a Dominican might envy, I go in and dine, and after dinner we sally forth. There is an ineffable stillness and beauty in this golden afternoon, influencing everything that is best and gentlest in my nature. I am literally in a vernal mood; I see freshness and beauty in everything; I am prepared to enjoy, and I do enjoy.

Our way lies for a time through portions of a low-lying moorland tract, which drainage and cultivation have reclaimed within the last century. Parts of it even yet remain a wild morass. It is most of it, acre by acre, the property of one of our great dukes, who is undoubtedly a good agriculturist as well as landlord. You see and know the duke's hand everywhere. His cottages and farmhouses are all in excellent repair; the gardens neatly kept and well stocked; the gates and fences in admirable condition; and miles and miles of excellent roads, canals, and plantations shew what capital and power can effect when combined and well directed. In this district of comparatively slovenly agriculture, these are significant facts, which prove that the duke has the art of choosing his deputies—no mean accomplishment in one who governs. All this is pleasant to consider as we drive gently through the still and sunny lanes; more particularly as we have contrasts that sometimes flagrantly disobey the rule of the Cairds and Puseys.

To vary this pleasant trimness of homesteads, fields, and woodlands, nature has her unadorned and loveliest aspects also. We pass rapid brooks; little trickling runnels; patches of unenclosed common, thick set with furze, or else with mossy hillocks, that shelter in their hollows countless tufts of budding primroses; and reaching one more wild and sequestered than the rest, we stay our little carriage. We descend; leave our pony for a few minutes to graze at will; gather our

first primroses; search for our first violets; step amid the plashy stones of a little rivulet, to taste the young water-cresses; sit down to rest upon a fallen tree; speak to one another of the vernal joy that fills our souls, to the utter absence of all care or retrospect; and then proceed on our way in a mood as sunny as the landscape itself.

It is three o'clock when we reach the little country town, and as it is market-day, it is filled with country-folks. They, and the quaint market-cross they fill to overflowing—the booths and their miscellaneous wares—the piles of country produce heaped upon the pavement—carry the mind back two centuries in civilisation—at least compared with London. We enter a linen-draper's shop, the best in the town; it is filled as densely as the market-cross, principally with country-women bearing huge baskets and parcels, which they set with much nonchalance upon the wide counters, and, leaning upon these, make gay-coloured purchases, and chat familiarly with the assistants. The favourite hues seem to be blue, red, yellow, and green, no matter how much these prevail in shawls, handkerchiefs, and ribbons, nor how amazing or bizarre the pattern. In gown-pieces and coloured pocket-handkerchiefs, the designs are sometimes tremendous in effect—the latter revealing whole dioramas of the Crystal Palace, of the life and doings of our good Queen, the funeral of Wellington; and so on. In this respect, their taste for textile art is like that of children or Hottentots. Every young assistant seems to have a personal friend amongst these worthy dames. Many bring them messages and letters, and occasionally, from the recesses of a cavernous market-basket, a cream-cheese, a dozen of rosy apples, a pork-pie, or plumcake, is brought forth, slid with a shy hand across the counter, received with thankful winks and nods, and deposited in some private corner. The master, a portly, good-looking man of about fifty, occupies a prominent place behind the counter, to the right of the door. To him important comers address themselves—wealthy farmers, who step in to buy broad-cloth for a new coat, or else a Sunday neck-tie—clergymen's wives, who have driven over from their snug parsonages to purchase charitable supplies of calico and flannel—ladies, who call in to look over the last 'London parcel;' and as the afternoon wanes, and the market draws to a close, the Goodman is sorely tempted to purchase a 'last pair of fowls,' a remaining cream-cheese, or a pound or two of butter left unsold.

'It is such a pity, Mr Turner,' says a farmer's rosy wife, 'to take back these fowls eleven miles or more. Come, you shall have 'em cheap; and I'll take it out in net and ribbon for a cap: I want one for a Sunday.' But we cannot stay for the sequel of the

dialogue, although it is obvious enough that the fowls will change hands: we leave the shop and town on foot, as our little carriage is to follow us by and by.

The afternoon is waning gloriously; our vernal humour comes back to us once more. We stay to notice the ancient church of red stone, and its execrable renovation with unsightly brick; we stay to admire the fine old timbered gabled-houses of the age of Elizabeth; we get glimpses of pleasant bowery gardens in the rear, and of a fine country beyond; we descend an acclivity, cross a canal, and gain a hilly road, winding amid scenery of unsurpassed beauty and of great historical interest. Along it had tramped Cromwell and his Ironsides, and the ruins of the castle he had successfully besieged, lay gray and ivied on the heights above.

A walk of some two miles brings us to a most German-like village of scattered farms and cottages. The former are chiefly timbered gabled-houses of great antiquity, coloured with ochre, or alternate black and white—and lying with sombre yet unleaved orchards about them, and rustic gardens newly dug and trimmed, with lanes between, winding upwards to a broad belt of woodland: there is much to favour our strong impression, that we are wandering in some village of Germany or the Dutch Netherlands. A long way up the tree-shaded street, we come to a coach-house and stables abutting on the road; then to a paved yard, in which a quaint, middle-aged man is working; then to a cottage profusely covered with new-clipped ivy, and with its narrow strip of garden betwixt it and the road, set with nothing but laurel-trees, amidst which stands an ancient draw-well, and on the low wall dividing the garden from the road, a vast horse-block of lichen-covered stone. We knock at the door, and are soon admitted into a pleasant parlour with a cheerful fire; a singular window placed high and near the ceiling; a piano, books, and a vast number of beautiful shells, finely grouped beneath a large glass-shade. In addition to these is a bouquet of wax-flowers of singular excellence; and though I am but a rare admirer of these imitations of nature, I am enough of an artist to be aware that here a naturalist has worked *con amore*.

The door opens, and a young woman of sweet looks and singularly gracious manners enters. I have—with my usual taciturnity in such matters—asked no questions, so I take for granted that she is a daughter of the cottage owner, and that father, mother, brother, or sister will presently appear; but half an hour wears by in pleasant talk, and still we are alone.

At length the lady—with whose manner I am greatly charmed—says to me: 'Will you see the poultry?' and I, not knowing the wide meaning conveyed by the article, politely, though, I fear, too coolly, assent; for I am ignorant of what lies before me. We pass into a pretty hall, which winds old-fashionedwise towards the rear of the cottage; we stop to admire some paintings on its walls, and this leads to a talk touching art, and so by degrees to what constitutes a love of nature.

'I am very fond of nature,' says the lady gently; 'so is my sister, who lives with me. At present she is absent on a visit to a friend.'

As she speaks, she leads the way into a parlour fit for a poet's study. It has some really fine paintings on its walls—amongst others, an undoubted three-quarter length picture of Nell Gwynne, by Sir Peter Lely, and the wonderful painting of the hands bespeaks its genuineness: there are recesses filled with books; there are

shells and flowers again, as in the other parlour; there is a large number of brilliant-coloured foreign birds, stuffed and set upon the branches of a natural tree, which has been dried and fixed in a stand for the purpose; there are the splendid cocoons of last year's silk-worms, which were made to wind their profuse gifts round a gnarled bough; and, lastly, there are two windows on each side of an angle of the room—the one looking over an old-fashioned garden, with bee-hives, flowers, privet-fences, old apple and mulberry trees, to the woodlands of a distant park; the other window shewing a very large undulating paddock belonging to the cottage, a pool in the midst, a belt of sheltering trees next the road, and the yellow beauty of a thousand new-blown daffodils. It is, as we say, a room fit for a poet and his songs!

Passing into the garden, with its borders full of early flowers, and its fine collection of standard roses trained, festoonwise, to chains, we pass to the low gate and fence which divide it from the paddock, and behold the first instalment of 'the poultry,' or rather, as we suppose in our simplicity, the whole stock. The lady opens the wicket, stoops down, and in an instant a pair of pure white fowls, of great size and beauty, run towards her, and search for food in her hand with the utmost tameness; but disregarding these, though they are favourites, she puts her hand in a movable coop set in the grass, beneath which is a brood-hen with some thirteen chicks, only a few days from the shell. The hen is a pure buff Cochon fowl of large size and beauty, and the chicks miniature likenesses. They are running about in all directions; but expecting food from the hand which invariably feeds them, they come running to the stooping lady, peck her fingers, climb her hand, enter the folds of her wide sleeve, and suffer themselves to be caught and imprisoned in her gentle grasp without a flutter or sign of trepidation. We have seen nothing like this wonderful tameness before: they rest perfectly in the restraining fingers; even coax with their callow bills moving to and fro, and shew the wonderful beauty of their eyes in doing so. This feature in the Cochon fowl is extraordinary, and seems peculiar to the breed. We remember nothing like it, except the eye of the gazelle. Soft, large, and of great size, it would thus appear to be as much a distinct feature of high and perfect breed in the fowl, as in the horse and human being.

'How much these lovely chicks like you!' say I, as the lady rises with a nestling chick in her hand.

'They are accustomed to me,' she replies quietly, 'and therefore know me. I partly freed them from the shell; I have fed them ever since, and begin to do this as early as half-past five o'clock in the morning.'

'Indeed!' for the truth begins to dawn upon us; 'then you are a fowl-fancier, and make a pursuit and art of the matter?'

She replies only with a smile; then calling a little attending servant, bids her remove the feathered charge, as the dew begins to fall, and then asks us to accompany her elsewhere. We obey without a word, and crossing the garden, are led into the yard in which we first saw the quaint old servant-man at work. Here, in coach-house, harness-room, tool-house, cow-house, stable, we find brood upon brood in various stages of progress. Some hens are yet sitting in still recesses—some on real eggs, others on dummies of wood; and the coach-house holds two pens constructed on the

most scientific principles, each holding a hen and chicks of great value and beauty. Nor are remnants of last year's broods unseen. Gigantic cockerels and young matronly pullets peck about the yard and the precincts of the garden; and these, as tame as the chicks, suffer themselves to be handled and caressed. One noble bird, in incipient comb and wattles, permits himself to be lifted, carried up and down, and caressed like a child. The result of unvarying kindness can go no further. It is exquisite to behold, and teaches us, I think, a grave as well as affecting lesson.

We are now invited to cross the garden to the greenhouse, wondering whether it is plants or poultry we shall behold. All this while we have been expecting to see the before-mentioned supposititious father, brother, uncle, or mother, issue from the house; but as no one appears, and our curiosity is wound up to a considerable pitch, we make bold to ask the question:

'Do you and your sister actually live here alone? Have you no father, uncle, or brother? And do you really carry on all this scientific process of rearing poultry on so large a scale without assistance?'

'We do—simply as a pastime, though it pays us well. For the rest, we live here alone, perfect mistresses of all you see through the will of a dear uncle, who died two years ago.'

I am immensely interested, and standing in the rich waning sunlight of that April afternoon, our pleasant chat proceeds.

'Charlotte and I,' continues the lady, 'first took to rearing poultry about a year and a half ago. A friend gave us those white fowls you first saw; we became interested in the care of them; and reading and hearing much of the poultry mania, we thought we should like to add to our stock, and become purchasers of some real Cochins. We did not mention our desire to our neighbours or few relatives, lest we should be laughed at, but resolved to act instead, and to set out at once to Greys in Essex, where the greatest fancier and prize-holder resides. We intrusted the secret of our temporary absence to no one but John, our old man-servant; and set off one very cold December day by express-train to London. We were perfect strangers there, having never been beyond Birmingham in our lives. We slept at a hotel that night; started by steam-boat next morning to Greys; found Mr S—from home; but saw his bailiff, and concluded the purchase of a young cock and hen of the pure buff Cochins breed for five guineas. They were placed in a proper basket, and we returned the same night with our precious charge to London. A tribulation, though one rich in humour, now occurred. We must have a room for ourselves and fowls, for it was necessary to keep them under our especial care. We were refused admission by no less than five hotels. "Can't be having them things up stairs," said the head-waiter of one of them with much contempt. We assured him of their great value and tenderness. But he condescended to make no reply, tucked his napkin tightly under his arm, and turned away upon his heel. At another hotel, the landlord himself was summoned. We made our request with great politeness. "It cannot be, ladies; it is not only against the rules, but the cock would be crowing in the night, and alarming everybody." We laughed, and assured him that the cockerel had not yet arrived at a crowing age; but he was inexorable. At length, at a hotel near Euston Square, we gained admittance, and were attended by a chamber-maid who had a pet-dog, and consequently sympathy for our taste, and who was thus very kind to us. This was fortunate, as we were quite exhausted by cold and fatigue. Next day, we travelled homeward, got a conveyance from the little town you saw to-day, and arrived here in the evening. If John, our old servant, was surprised at the quickness of our journey, he was more so at the

size of the basket that held our feathery treasures; and this surprise waxed into astonishment when the basket was brought into the parlour, the lid opened, and the long-legged creatures stalked out and shook their feathers on the floor.

"Why, missis—why, missis," gasped John, "you don't mean to be saying that these big, stalking, tailless things be fowls? No, surely not; only some new sort o' turkeys or pea-hens."

"It is a real fact, John, that they are fowls: the breed has been brought from Cochins-China, within a few years. The parents of these are of immense value, and for what you see, Miss Charlotte and I have given five guineas."

"Five guineas! miss—five guineas!" repeats John with yet more astonishment: "somehow, it's a thing as masters me." Then, as he beheld their grotesque want of tails and long legs, he burst out into convulsions of laughter, in which our two little maids joined, and which did not soon end. But in spite of this, John took immensely to them, and has been a most able assistant.—But step this way, you have yet to see two other broods.'

As I have already conjectured, the greenhouse holds poultry instead of plants. There are, to be sure, a few young geraniums placed along the margin of the sunny windows; but the floor is occupied by wire-pens of scientific construction, in which are two hens of vast size and great beauty of colour, and their chicks. These are as tame as those we have already seen, and the eye of the chicks even yet more striking.

'You must have nearly a hundred little ones,' I remark.

'There are ninety-five, and others that will be from the shell in a few days. These you see here will sell, when of the proper age, for three guineas a couple: that is what we obtained last year.'

'Then you have not lost by your poultry mania?'

'By no means, though we have occasionally to make large outlays. We keep a strict account, and find we derive a considerable profit. But you must be really tired: let us now go in and take tea.'

We return to the parlour with the fine shells and pleasant fire, and find tea ready. We had been asked if we would taste Cochins fowls' eggs; and here they are, with delicious cakes and cream and hot bread, and a glass dish full of apricot jam. It is something, I think to myself, to be the heiress of such a home, as I hear orders given, and keys, that more plate may be brought; but it is something still more satisfactory to see wealth thus creditably expended, taste taking such an innocent direction, and womanly love and solicitude, unoccupied by maternity, directed into the path of the naturalist. There were feelings and tastes here present that Audubon, or Wilson, or Kirby, or Spence, or Bewick, would have honoured and encouraged.

Our talk is so delightful during tea, so perfectly frank and kindly, that our vernal mood is even richer still. When it draws to a close, we join hands, thank Providence that we have met, and with regrets that I am about to leave for town, promise one another to meet again next year: which, Fate willing, we shall certainly do.

We now go up stairs to see countless unoccupied rooms—some filled with very ancient and splendid carved furniture; another as a studio; another as a writing-chamber; for both the young heiress and her sister have artistic tastes, and the one that is with us draws with skill.

We at length leave the cottage to climb a hill at the end of the German-like village, where there is a splendid view of many of the Welsh hills; but when we get there, it is too dark. We therefore cross a moorland tract, and coming to the road, find our little carriage at the spot we mentioned. We join hands again; we are sisters in spirit, though not in relationship; our

mood is something more than vernal, for words can give it no expression.

The dear lady passes away into the shadows on her return; we are driven home along a causeway raised across a once terrible morass, where man and horse were often sunk, and seen no more; and in the splendid moonlight we reach our cloistered hall as the clock strikes ten.

Such was my April-day. It was fine and vernal, and I would have its spirit refresh others as much as it refreshed me.

### THE PUN UPON NAMES—MORE OF IT.\*

Palter with us in a double sense.

FROM the complimentary puns, and those which are expressive of grief and despair, we proceed to a numerous class—those, namely, which give vent to rage and indignation, scorn and mockery.

The Wars of the Roses, as portrayed by the writer of the Three Parts of *King Henry VI.*—whether Shakespeare or not, we do not here pause to inquire—are especially prolific in examples of this kind. In the Second Part of this drama, we find the old nobility declaiming in indignant terms against the pride and power of Queen Margaret's favourite, the Duke of Suffolk.

*Gloster.* Suffolk, the new-made duke, that rules the roast,

Hath given the duchies of Anjou and Maine  
Unto the poor King Regnier.

*York.* For Suffolk's duke—may he be suffocate,  
That dims the honour of this warlike isle.

This worthless upstart, whose name was De la Pole, seems to have been peculiarly obnoxious to this kind of witticism. He is banished from England, and being taken prisoner in the Channel by a privateer's boat, the captain orders his execution.

*Cap.* Convey him hence, and on our long-boat's side  
Strike off his head.

*Suf.* Thou dar'st not for thine own.

*Cap.* Yes, Poole.

*Suf.* Poole!

*Cap.* Poole! Sir Poole! lord!

Ay, kennel, puddle, sink, whose filth and dirt  
Troubles the silver spring where England drinks.

Again, we find Jack Cade, who at the head of his rabblement has routed the king's troops and seized the Tower, thus disporting himself with the name of the Lord Say, whose capture has just been announced by a messenger.

*Mess.* My lord, my lord! a prize, a prize! here's the Lord Say, who sold the towns in France—he that made us pay one-and-twenty fifteens and one shilling in the pound, the last subsidy.

*Enter George Bevis with the Lord Say.*

*Cade.* Well! he shall be beheaded for it ten times.—Ah! thou say,† thou serge, thou buckram lord: now art thou within point-blank of our jurisdiction regal.

The gallant Sir John Talbot is bemoaning the fate of his friends, the Earl of Salisbury and Sir Thomas Gargrave, who have just been struck down by a shot

from the town of Orleans, when a messenger interrupts his lamentations:—

*Mess.* My lord, my lord! the French have gathered head.  
The Dauphin, with one Joan la Pucelle joined,  
A holy prophesie, new risen up,  
Is come with a great power to raise the siege.

[*Salisbury groans.*]

*Tal.* Hear, hear! how dying Salisbury doth groan!  
It irks his heart, he cannot be revenged!  
Frenchmen, I'll be a Salisbury to you.  
*Pucelle or puzzel,\** dolphin or dogfish,  
Your hearts I'll stamp out with my horse's heels,  
And make a quagmire of your mingled brains.

The Duke of York, who was so facetious upon Suffolk's name, is in his turn exposed to similar mockery. Queen Margaret getting him into her hands, slaughters him in cold blood, and then wreaks her indignation against the corpse:—

Off with his head! and set it on York gates:  
So York shall overlook the town of York.

From a late life of Sir Edward Coke, whose name, provocative of punning, we need hardly observe, is pronounced Cook, we learn that when Sir Edward was sent to the Tower, the lodging allotted to him was a room which had formerly been the kitchen. On entering it, the disgraced patriot read the mocking inscription:—'This room wants a cook.'

We now turn to the Father of History, amidst the infinite variety of whose pages one seldom searches in vain for an example, whatever may be the subject in hand; and we find that when the haughty Darius sent envoys to the different Greek states to demand earth and water, in token of subjection, the people of Ægina complied with the requisition, and by so doing, incurred the indignation of Sparta. One of her kings, Cleomenes, was accordingly despatched to the offending island with instructions to demand the surrender of the advisers of this disgraceful measure. An influential party amongst the Æginetans resisted his demand, and Cleomenes was on the point of leaving Ægina, when, on a sudden, he turned to the most zealous of his opponents, and inquired his name. 'Crius,' was the reply; on hearing which, the infuriated Spartan exclaimed: 'Make haste, then, Ram [Crius], and get your horns gilded; for before long, you'll meet with a mischief'—alluding in this to the practice of the ancients of gilding the horns of victims appointed for sacrifice. The joke, however, proved to be no joke to the Ram; for Cleomenes returning with his fellow-king at the head of some troops, the Æginetans dared no longer hold out, but gave up ten of their principal men, amongst whom was the Ram. These were then placed by Cleomenes in the hands of the Athenians, who, being old and inveterate enemies of Ægina, were not very likely to be lenient jailers.

The odium theologium, as may easily be supposed, has not neglected to add this kind of pun to its inexhaustible armoury of virulence and abuse. One specimen will doubtless suffice. The orthodox Walsingham speaks in these terms of our early reformer:—'That old hypocrite, that angel of Satan, that emissary of Antichrist, the not-to-be named John Wickliffe, or rather Wicke-beleve, the heretic,' &c. Truly, as Mistress Quickly says, these be very bitter words.

We now give a few instances of the pun upon the names of places.

In the third act of *King John*, when the English monarch subjects himself to the anathema of the

\* See No. 16.

† Say, a kind of serge—probably a corruption of the French word *soie*. It is probable that Jack Cade having termed Lord Say a buckram lord, has in view a stuffed man set up as a mark for archers who are practising; and that in the next sentence he keeps up the allusion.

\* *Puzzel*, wanton, a corruption of the Latin *puerile*. With respect to the word *dauphin*, the origin of the title is unknown. It is, however, certain that it is not derived from the name of the province Dauphiné, but, on the contrary, the name of the province is taken from it.

cardinal-legate, the much-injured Constance joins her maledictions:—

O lawful let it be  
That I had room with Rome to curse awhile.

And in a somewhat higher strain, the lean and wrinkled Cassius expresses the jealous hatred with which he regards the supremacy of Cæsar.

Now is it Rome indeed, and room enough,  
When there is in it but one only man.

*Julius Cæsar*, Act I. Scene iii.

Again, the ill-fated Richard II. being besieged in Flint Castle by high-reaching Bolingbroke, the Earl of Northumberland proposes an interview between the king and his usurping subject.

North. My lord, in the base court\* he doth attend  
To speak with you: may't please you to come down?

K. Rich. In the base court? Base court where kings  
grow base,

To come at traitors' calls, and do them grace.

We now turn to the merely sportive or facetious play upon names, which is indeed common enough; so much so, that our only difficulty here will be an *embarras des richesses*.

In the *Taming of the Shrew*, Petruchio thus addresses the refractory Katherine:

Thou must be married to no man but me,  
For I am he am born to tame you, Kate,  
And bring you from a wild cat to a Kate  
Conformable, as other household Kates.

In the same drama, Lucentio is introduced into the house of Baptista under the assumed dress of a music-master and the name of Cambio; and in this disguise he wins the affections of Baptista's daughter, Bianca. Baptista then meeting him in the street, dressed and attended as a man of wealth and rank, exclaims:

Why, tell me, is not this my Cambio?

To which Bianca replies:

*Cambio is changed into Lucentio.*

The lady's own name admits of a similar play, which Petruchio avails himself of; and when boasting of the superior docility of his own wife, he thus rallies Bianca's husband:

'Twas I won the wager, though you hit the white.†

The facetious knight, Sir John Falstaff, is of course not lacking in this kind of wit. The two worthy magistrates, Master Silence and Master Shallow, are thus sported with:—'Master Silence, it well befits you should be of the peace.' And again: 'I do see the bottom of this Justice Shallow.' His mirth upon the names and appearance of his gallant recruits, Mouldy, Shadow, Wart, Feeble, and Bullcalf, seems inexhaustible; but for this we must refer the reader to the play itself. On the field of Shrewsbury, he thus intimates his valiant intentions against Hotspur. 'If Percy be alive, I'll pierce† him; and when 'ancient Pistol' is raising a disturbance in Mistress Quickly's tavern, he reproves his obstreperous conduct with this sally: 'No more, Pistol; I would not have you go off here: discharge yourself of our company, Pistol.'

If we turn to *Othello*, we find another 'ancient,' honest Iago, thus consoling his dupe Roderigo—

Does't not go well? Cassio hath beaten thee,  
And thou by that small hurt hast cashiered Cassio.

In the Second Part of *King Henry VI.*, while Jack Cade is pompously setting forth his pretended

genealogy, one of his rabblement, Dick, the butcher of Ashford, thus turns it into ridicule—

Cade. We, John Cade, so termed of our supposed father—

Dick. Or rather of stealing a cade of herrings. [*Aside.*]

Cade. My father was a Mortimer.

Dick. He was an honest man and good bricklayer.

[*Aside.*]

Cade. My wife descended of the *Lacies*.

Dick. She was indeed a pedler's daughter, and sold many laces.

[*Aside.*]

We may here remark, *en passant*, that the sallies of Dick the butcher are incomparably the poorest to be found in the whole range of Shakspeare's plays, our great dramatist having far too accurate a knowledge of human nature to put any but the humblest witticisms in the mouths of uneducated persons. The highly lauded Sam Weller, however amusing, we confess appears to us entirely out of nature, Mr Dickens having furnished him with a stock of *mots* and repartees sufficient to supply all the footmen and cabmen in London, and yet leave a large surplus remaining.

Our instances of mirthful puns hitherto have been cases in which they seemed congenial to the temperament of the speaker. Gaiety, however, has a more striking effect when persons of stern and saturnine disposition indulge in it, as they will do at some time or another. In one of Uhland's ballads, the stout old Count Eberhard,\* of Wirtemberg, is introduced to us, recruiting his wearied frame, which is almost worn out with years and hardships, in the healing waters of the Wildbad. While he is thus engaged, his youngest page comes running, and announces that an armed band is pouring down the upper valley. The armorial bearings of their leader being described, the good count recognises the enemies of his house, the *Schlegler*, and makes an attempt at a pun which we cannot term felicitous:

Mein sohn! das sind die *Schlegler*, die *Schlagen* (strike) kräftig drein.

Next arrives a poor herdsman in breathless haste, who brings tidings that another troop is pouring down the lower valley—the device of their leader being three axes, and his armour glittering and glancing in the sun. The aged hero, warming with the danger that encompasses him, somewhat improves on his former effort:

Das ist der *Wunnensteiner*: der glüssend Wolf, genannt:  
Gieb mir den Mantel, Knabe, der glanz ist mir bekannt:  
Er bringt mir wenig *Wunne* (joy): die Beile hauen gut.

This second sally of the count's brings to our mind an attempt made by a respected divine who resided not far from Oxford, and speaking of Mr Joy, the well-known tailor of that city, facetiously remarked: 'Ah, no joy to me: he makes my coats too tight under the arms.'

A yet higher and more important use of this kind of pun remains to be noticed: in many cases, a name is found to be suggestive, and being taken as an omen, originates some great undertaking, which influences the history of a nation, and even in some cases that of the world. Thus we read that Gregory, who was afterwards pope, and surnamed the Great, happening, when a young man, to pass through the slave-market of Rome, his attention was caught by some boys with fair long hair and blooming complexion, who were exposed there for sale; and asking the slave-dealer of what country they were, he answered that they were *Angles*. 'Rightly,' cried he, 'are they called *Angles*, for they are as fair as *Angels*; and I would they were cherubims in heaven.'

\* Base court. Base cour, lower court.

† Cambio, exchange. Bianca, white.

‡ The name of Percy, according to Boetius, was derived from 'piercing the king's eye'—an etymology not altogether to be trusted to.

\* This Count Eberhard was the friend and patron of John Reuchlin, better known by the name of Caplio, who himself was the friend of Erasmus and instructor of Melancthon.

But from what province of Britain are they?' inquired Gregory. 'From Dëira,' said the slave-dealer. 'Dëira; that is good,' returned Gregory: 'they must be delivered from the wrath [de ira] of God. But what is the name of their king?' 'Ella,' said the man. 'Ella!' replied the saint; 'Hallelujah then must be sung in his dominions.\*' The result was, that Gregory, on ascending the papal throne, sent out a mission with Augustine at its head, and Britain was converted to Christianity.

Another example of this kind we find in Herodotus. The Grecian fleet being anchored off the island of Delos, certain Samians of rank came on board, and entreated the commanders not to lose the opportunity of liberating the Asiatic Greeks from the Persian yoke. The commanders hesitated, but Leotychides, the admiral, asking one of the Samians his name, he replied that it was Hegesistratus [Leader of Armies]. The Greeks at once hailed the omen, and setting sail for the coast of Ionia, engaged with the Persian fleet, the result of which was the far-famed victory of Mycale.

Not only, however, has a pontiff by this means been invited to the conversion of distant barbarians, and a great people aroused to effect the liberation of their enslaved brethren, but, by similar agency, the fainting spirits of a *chevalier d'industrie* has been revived, and himself encouraged to renewed exertion. This instance we derive from the *Confessions of a Swindler*, the candid writer of which informs us, that in the course of his peregrinations, he arrived at Bury St Edmund's, in Suffolk, his pockets empty, and his mind dejected, almost, indeed, entertaining the idea of abandoning his craft for some more lucrative profession. 'Lost in these gloomy thoughts,' continues he, 'I was strolling down the Abbeygate Street, when on a sudden I happened to cast up my eyes; and over a shop on the other side of the way, which was that of a silversmith, I saw staring me in the face the name of *Gudgeon*. This sight at once raised my declining hopes, and pointed out to me a new sphere of action.'

The mention of a *chevalier d'industrie* brings us, by a concatenation of ideas not altogether unnatural, to the imperial wearers of the crown of Monomachus. That the sagacious Catharine was well aware of the true use and value of this species of pun, is evidenced by her introducing into her encroaching house the significant name of Constantine. This name, first imposed by that aspiring grandam upon the second son of Paul, has again made its appearance in another generation, and manifestly indicates an intended successor to the long-vacant throne of the Byzantine emperors.

So attached, indeed, is the house of Romanoff to significant appellations of this kind, that, as we lately learn from the public prints, the infant child of the Grand Duke Constantine has been baptised by the name of *Wiera*, or *Faith*, as indicative of the grand principle in support of which its august grandsire has lately challenged the whole civilised world to combat.

We may here remark, that to the name of *Napier*, though it is evidently derived from the first bearer of it supplying the royal *napers*,† has been frequently assigned the impossible origin of 'he hath *nae peer*'—a eulogy, indeed, to which many members of that remarkable family gain a title by their talents and virtues, but with which their name certainly has no kind of connection.

We shall conclude with an instance of the punning epitaph, of which we find no more striking example than that inscribed on the vault at the nunnery of Godstowe, which enclosed the mortal remains of the once fair Rosamond. Its Latinity, indeed, is not

exquisite, but its language, which, though coarse, is not wanting in vigour, ably brings out the contrast between the living and breathing paramour of a monarch, and the poor inhabitant of the tomb:—

Hic jacet in tumbâ Rosa mundi, non Rosa munda:  
Non redolet sed olet, quas redolere solet.

## THINGS AS THEY ARE IN AMERICA.

### RHODE ISLAND.

CRAMPED into a small space between Massachusetts and Connecticut, we may see on the map a state called Rhode Island—the island from which it derives its name being a mere speck within a bay on the sea-coast, and the bulk of the state being in reality on the mainland. How this little state came into political existence, is one of the most interesting circumstances in American history.

I have had occasion to refer to an unfortunate feature in the character of the Pilgrim Fathers—their extreme intolerance. Though fleeing from religious persecution in England, and suffering for conscience' sake, their polity admitted of no departure whatever from their own tenets and practices. Themselves in exile as Nonconformists, they sternly repressed by fine, imprisonment, and even the gallows, everything like nonconformity to their own favourite form of belief. The early history of New England abounds in the most revolting instances of this species of oppression; and no case appeals so warmly to modern sympathy as that of Roger Williams. This was a young English divine of good education, who arrived in America in 1631, and became a much-esteemed Puritan preacher. Being, however, of a kindly disposition and enlarged understanding, he could not reconcile the legalised principle of intolerance with the injunctions of the Gospel; and in spite of remonstrances against a continuance in 'error,' he at length boldly proclaimed the doctrine of freedom of conscience, which till that time was practically unknown. The proposition that no man should be troubled on account of his religious opinions, was intolerable to the magistracy of the settlement; and Williams, abandoning family and home, was constrained to flee from place to place for personal safety. The account of his wanderings and privations among the Indian tribes who hung about the borders of Massachusetts, forms the subject of a deeply-affecting narrative, which has lately been given to the world by one every way competent for the task. Passing over the history of his sufferings in the wilderness, we find Williams still undaunted, and resolute in carrying out his opinions to a practical issue. Borrowing a canoe, he sets out with five adherents on what may be called a voyage of discovery; his object being to find a spot where every man might live and enjoy his religious opinions in peace. In this adventurous excursion, Providence seemed to guide the frail vessel to the banks of a small arm of the sea, projected inland from Narraganset Bay. Here, according to tradition, being hailed from a rock by a friendly Indian, Williams and his party landed, and were hospitably received by the chiefs of the Narragansets, from whom he received a grant of territory, to which, in pious gratitude, he gave the name of Providence. This event occurred in June 1636, and was the foundation of a new English settlement—place of shelter, as Williams described it, 'for persons distressed for conscience.' Being situated beyond the

\* Keightley's *History of England*.

† *Napery*, linen, from the French *napper*, from which is formed *nappier* or *napiet*, as *drapier* from *draps*. The reader may perhaps not remember that the person we now call a *draper*, was formerly called a *drapier*—as an instance, we may mention the celebrated *Drapier's Letters*.

jurisdiction of New Plymouth and Massachusetts, the magistrates of these colonies had no proper title to interfere with the settlers in Providence, and they satisfied themselves with prognostications of disaster and ruin to a state which was so deficient in the elements of authority. Contrary to these anticipations, the young settlement thrived amazingly, by the flocking in of persons desirous of liberty to profess their peculiar religious opinions. To all who came, Williams, like a benevolent patriarch of old, gave freely of the lands he had acquired, and he is said to have left nothing for himself or family. As population accumulated, he felt the inconvenience of acting without legal sanction; and he accordingly proceeded to England in 1644, and procured a charter from Charles I., constituting an English colony under the title of the Plantations of Providence and Rhode Island. On the occasion of a second visit to England in 1663, Williams obtained a more comprehensive charter from Charles II.; and curiously enough, through every phase of history, the provisions of this latter document have continued, with certain modifications, to be the constitution of the state of Rhode Island.

The opportunity of visiting a spot hallowed by one of the noblest struggles for civil and religious liberty of which history offers an example, was not, I thought, to be neglected. I had only two days to spare previous to going southward, and these I resolved on devoting to a pilgrimage to the small commonwealth founded by the immortal Roger Williams. So numerous are the railways diverging from Boston, that no difficulty is experienced in proceeding in the required direction. On a bracing and clear Saturday morning, I took the line to Providence, situated at the distance of about forty-two miles in a southerly direction. The route pursued lay through a country of hill and valley, dotted over with rough shrubby woods, enclosed pasture-fields, and villages of white houses, where manufactures of some kind appeared to be carried on. These seats of industry are seen chiefly nestling in hollows, on the banks of small streams, where they enjoy a command of water, either for moving machinery or to aid in the process of manufacture. Everything denotes that we are passing through a district of the usual orderly New England character. At the several stations along the line, a respectable class of persons drop into and depart from the cars, and it seemed to me that the cars themselves were the neatest and most commodious I had yet seen in my excursion.

After clearing the minor places on its route, the train entered a spacious valley with an arm of the sea at its lower extremity; and here, on both sides of a tidal basin connected by bridges, stands the venerable city of Providence. It was my good-fortune to have made the acquaintance of a gentleman of the place in the course of my voyage across the Atlantic; and hospitably entertained by him on the present occasion, I was enabled to acquire much useful information respecting the locality. To get to my friend's residence, it was necessary to drive up a steep street leading from the central part of the town in an easterly direction towards a high level ground above, on which rows of handsome villas have recently been erected. The villas are, indeed, mostly of wood, but they are very pretty, with neat gardens in front, and gateways by which you may drive up to the door. Some have glass conservatories for flowers and tropical plants, connected with the drawing-rooms; and it is seen from other indications, that we have got among a class of dwellings inhabited by families of taste and opulence.

Temporarily settled in one of these suburban structures, I requested as a favour to be conducted

settlement. It was at no great distance. The site of the city of Providence, and this part of its environs, is a stretch of land between two indentations of the sea; and we have only to walk about a mile to the eastern boundary of the peninsula to find the subject of our research. A short ramble along a broad and newly laid out avenue, offering frontages for building-lots, led us to the brink of a high bank, from which we could look down on the memorable scene. Before us is a sea-water inlet, of no great breadth, with a sandy and rocky shore on each side, surmounted by rough, shrubby banks; all being as yet untouched by art, though probably destined to be involved in the traffic which in the first instance has settled around the harbour of Providence. By a rough path, we scrambled down the declivity to the water's edge, and there stood on the dark slaty rock from which Williams is said to have been saluted by the Indian. According to the legend, the words 'What cheer,' were employed on this occasion; and till the present day the seal of the city of Providence represents Williams's landing, surmounted by 'What cheer' as a motto. 'What cheer' is the perpetual slogan of the Rhode Islanders. It is seen stamped on their public documents; and in the principal street of Providence, there has lately been erected a remarkably fine building, entitled 'What Cheer Hall!'

After visiting the landing-place of Williams, I proceeded towards the town in quest of other memorials of the apostle of toleration. Of these, however, not many are in existence. Williams, at his death, left nothing of an enduring kind but the memory of his good deeds, and over his mortal remains no monumental stone has been erected. The humble edifice in which he ministered has long ago been succeeded by a larger and more handsome church pertaining to the Baptist communion. It is situated in the midst of an open piece of ground, on the slope of the hill near the town. On the brow of the eminence, from which a fine view is obtained, there has been erected a neat edifice for the accommodation of the Historical Society of Providence. Here, among many curiosities of an old date referring to colonial affairs, were shewn some crown-charters, and in a mass of detached papers I had the pleasure of seeing several letters of Roger Williams, written in a small cramped hand, and yellow with age—almost the only relics which Providence can shew of its celebrated founder. Across the way, and at the same elevation, are situated various stone buildings devoted to the purposes of the Brown University—an institution directed by the Baptists, and under the presidency of Dr Wayland, author of a well-known treatise on moral philosophy. I looked through the library of the university, which consisted of 20,000 volumes of choice literature, kept in the finest order. In a more central part of the town, is the Athenæum, an establishment which combines a large library for general use with a reading-room, where I found a choice of English newspapers and periodicals. Providence possesses a variety of benevolent and disciplinary institutions, and is not behind any city of its size in New England for the number of its schools. On the Sunday during my stay, I attended one of the Congregational churches, in which a good practical discourse was delivered to a respectable audience. The population of Providence is about 37,000, who possess among them thirty-five churches of one kind or other; so that it can scarcely be said the tolerant doctrines of Williams have led to a neglect of religious ordinances.

Rhode Island possesses several other towns of importance, one of them being Newport, a place of fashionable summer resort, situated on the island which gives its name to the state. In its general industrial features, Rhode Island resembles the neighbouring New England states, being thickly studded with cotton,

for which water-power presents numerous facilities. But more interesting than any of its material pursuits, is the singularly democratic character of its constitution, which, as has been said, differs little from that which was imparted by Charles II. to the colonists. While Massachusetts was placed under the authority of a governor delegated by the crown, the settlers of Rhode Island were empowered to elect a governor from among themselves, and the routine of the election has proceeded uninterruptedly since 1668. The revolution which overthrew the English authority in the states generally, was therefore attended with no novelties in the administration of Rhode Island. A governor, senate, and house of representatives are elected annually by the citizens of the state, the ordinary expenses of which, derived from a population of 147,000, and an area of 47 by 37 miles, are only 50,000 dollars. Besides this sum, the state expends directly from its treasury for education 35,000 dollars per annum, to which may be added 55,000 dollars raised by local assessment for the same purpose. The yearly salary of the governor, I understand, is 400 dollars. Think of £80 a year for a governor; and think also of another fact which excites equal surprise—a state in which more is expended for education than for the whole apparatus of civil government! Happy little state, which seems to go on flourishingly under a taxation of a dollar a head, everything included! And yet in this elysium there has been a rebellion. In 1842, an extreme party, much to the discredit of Rhode Island, took up arms to vindicate their irregular proceedings; but the community plucking up courage, quelled the insurrection with little trouble; and in 1848, the existing modified constitution was adopted with general approbation.

Settled into the condition of an old country, Rhode Island, like Massachusetts and Connecticut, does not offer a field for copious immigration; but I am warranted in saying that artisans, and almost every class of manual labourers, would have no difficulty in getting employment at good wages. At Providence, I was told of an Irish labourer who had contrived to save 1500 dollars, with which he cleared out for the western states, where land is still easily acquired. In the course of my conversation with gentlemen who called on me during my short stay in the place, I was questioned respecting the condition of the working-classes in Great Britain; the subject being apparently a matter of interest to those intelligent inquirers. The description I was able, from personal knowledge, to give of the ploughmen in Scotland was listened to with much surprise. 'A rural labourer of this class,' I said, 'is born and lives all his days in a humble cottage, thatched or slated, consisting only of one apartment, which contains two beds. The floor is of clay beaten hard, and is generally damp and productive of rheumatisms. The inside of the walls is usually whitened, seldom plastered; and a ceiling is ordinarily made of old mats nailed to rafters, about seven feet from the floor. The furniture consists principally of half-a-dozen deal-chairs, a deal-table, some plain crockery, one or two iron pots, and a flat disk of iron, whereon to bake oatmeal-cakes or bannocks of pease-meal. Besides this kind of bread, the food of the family consists of oatmeal-porridge, milk, hard cheese, and a little fried bacon; occasionally broth, with a modicum of meat. In the house of a thrifty ploughman, no tea, coffee, sugar, nor any luxury whatever is used, except on very rare occasions. To take up the ploughman at infancy, I continued, he goes to the parish school, which is perhaps three miles distant; and he is there instructed to read, write, and cipher, for which his parents pay the teacher a fee of from two to four shillings every quarter of a year. They also furnish him with books; one of these is a Bible—the reading of which as an ordinary lesson, with the committing of a catechism and some

psalms to his memory, as a task, usually constitute what in Scotland is called "a religious education." If the family is numerous, one juvenile, in corduroys and bare feet, is indulged with schooling only in alternate quarters. The schoolmaster may be good or bad; but over him the parents of pupils possess no control whatever. He is a fixture for life, and amenable only to the clergy of the Established Church, to whom he probably becomes a kind of sycophant. Should his life be extended to superannuation, no assistant can be legally imposed on him; and in some instances, accordingly, the education given is most miserable. What with this poor sort of schooling, herding cows, or helping at farm-work, the youth grows to manhood, and is hired at a country-fair to act as a ploughman. Young unmarried ploughmen are in some places lodged in huts by themselves, or accommodated with beds in the haylofts over the stables—in either case, greatly to their demoralisation. Getting over this critical period of his life, the ploughman marries, and a fresh family routine ensues. The cottage he occupies is one of four or five, built in a row, not far from the farm-steading, and called collectively, "the hinds' houses." Each cottage is provided with a small garden for growing vegetables; but seldom has it a single exterior accommodation of any kind. Coal, sticks gathered for fuel, and a dunghill lie heaped in front or rear—a scene of dirt and confusion. In this habitation and the adjoining fields, the ploughman passes his days. For his remuneration, he has the use of his dwelling rent-free; and besides a money-wage, has so much meal and other perquisites as make up a total of about £80 per annum; to which liberty to keep a pig and fowls are considered to be important additions. What he gives for all this is a hard servitude, admitting of little relaxation or intellectual improvement. He possesses no political privileges whatever. Publicly, he is not recognised, further than being under the protection of the law, or as forming material for the militia ballot, when that is in operation. He is not called on to serve on any jury, or to take part in any parish or county meetings, or to vote for one thing or other. His condition, in short, when considered apart from religious consolations, is *without hope*. From his miserable earnings, after rearing a family, what, in old age, can he have saved? Unless aided by his daughters, some of whom may be in domestic service, or employed to work in the fields, he probably dies a parish pauper. Latterly, I added, 'an attempt has been made by the gentry to render the ploughmen's dwellings more consistent with decency and comfort, and in some places considerable improvements have been introduced.'

'It appears to me,' said a gentleman present, 'that the condition of your rural labourers is little better than that of unprivileged serfs.'

'There is this great difference,' I observed, 'our rural, and all other classes of labourers, are not a degraded or despised caste. They are free, and, under fortunate circumstances, may rise from a humble to a high station.'

'True, so far,' was the reply. 'But the freedom you impart is associated with such depressing influences, that the chance of rising is very slender. The state of popular education in Scotland, according to your own account, is very bad; and in England it is worse. Only one-half of the women who are married in England can sign their names. Great numbers of the rural labourers cannot read. Your aristocracy, having insured the ignorance and incapacity of the peasantry, turn round and say they are unfitted to exercise any political privileges—a pretty kind of liberty that! The Americans are amused with the schemes resorted to in England for the purpose of promoting improved tastes among the humbler classes. Parties who, as members of the legislature, habitually vote against every reasonable plan for extending education

white with benevolent ladies and gentlemen to offer premiums to the best cultivators of flowers, bees, and cabbages; and we observe by the *Times*, that a society in England holds out expectations of a prize of a new coat, with fancy metal-buttons, to every peasant who reaches sixty years of age, without demanding or receiving relief from the parish! Anything rather than educate the people—charity rather than justice!

I was glad to say in answer to these remarks, that at present considerable efforts were being made to extend education in Great Britain, which would at no distant day be successful. The circumstance of so many English travellers inquiring into the methods of popular instruction in the United States, shewed that attention was directed to the subject.

'As you, then,' said my acquaintance, 'are making inquiries of this nature, be pleased to understand—that the education of all is a paramount necessity of our condition. For our own safety, we must educate the people; whereas in Great Britain, where the humbler classes have no political privileges, it appears to be a matter of indifference whether they are educated or not.'

It is unnecessary to continue my notes of this conversation. The last remark may be said to have brought out the philosophy of the question. Elementary education, so far as to enable every freeman to exercise the duties of citizenship with credit to himself and without danger to his neighbours, is a state-necessity in America. But we should be doing injustice to leave it to be supposed, that this guiding principle dates from the era of American independence. It is English, not American; and originated with the rule of the Pilgrim Fathers, who, with all their pragmatical and intolerant notions, had so high a sense of the advantages of elementary instruction, that one of their first public acts was to 'enjoin upon the municipal authorities the duty of seeing that every child within their jurisdiction should be educated.' This was as early as 1642; since which period, the system of elementary schools has been improved in various ways, and firmly established throughout the New England States, whence it has extended to other parts of the Union.

A few facts respecting the system of education in the parent state of Massachusetts, may here be adverted to. In the first place, the education is conducted at the public expence, and therefore no fees are paid by pupils. The doctrine on this point is—that 'the public highway is not more open and free for every man in the community, than is the public school-house for every child; and each parent feels that a free education is as secure a part of the birthright of his offspring, as Heaven's bounties of light and air. The state not only commands that the means of education should be provided for all, but she denounces penalties against all individuals, and all towns and cities, however populous or powerful they may be, that shall presume to stand between her bounty and its recipients. In her righteous code, the interception of knowledge is a crime; and if parents are unable to supply their children with books, she becomes a parent, and supplies them.\*'

The next remarkable feature of the common-school system of Massachusetts is, that it is under the administration of a general board of education, with local boards elected by all who pay school-rates. No corporations, lay or ecclesiastic, have anything to say in the matter. Schools are erected in districts, or divisions of towns, according to the wants of the population, as ascertained by a periodical census. The laws regulating the number of schools are exceedingly minute in their provisions. In 1850, the population of Massachusetts was 994,499, or close upon a million. Two years later—that is, in 1852—there were in the state 202,890 children between

five and fifteen years of age, for whose education the sum of 921,532 dollars was raised by public means, being very nearly a dollar for every inhabitant. Of the above number of children, the mean average attendance at the common schools was 144,477. It appears, however, that 20,812 attended private schools and academies; so that the entire number of children habitually at school was 165,289, or about 1 in 6 of the population. In none of the reports coming under my notice is any explanation given of the cause why the attendance falls so far short of the actual number of children. On inquiring into the circumstance, it was said that many parents were satisfied with sending their children three months in the year to school; the extreme temperature in winter and summer was also said to cause irregularity of attendance; and a heavy complaint was made against foreigners, more particularly Irish, for not taking care to send their children regularly to the free-schools. In Massachusetts there are laws against truancy; parents who neglect to enforce the attendance of their children at the free-schools, or any private school of their own choosing, being liable in penalties; but I fear these laws are loosely executed.

In the appointment of teachers, no religious test is imposed; it being sufficient that they are of a sound moral character, and competent for their duties. I believe that much difficulty is experienced in finding teachers who will attach themselves permanently to their situations; and the constant shifting tends to interrupt and injure the routine of instruction.

The state, in enjoining universal education, does not consider itself entitled to prescribe instruction in any specific religious doctrines—these being left to be taught by parents, by religious pastors, or by other private agencies. The teacher, however, is recommended to begin the duties of the day by reading a portion of the Scriptures, or by repeating the Lord's Prayer. The absence of direct religious instruction is represented by a recent English traveller as a defect in the New England system, which is leading to universal demoralisation. I feel assured that this, like some other faults with which the Americans are charged, is a gross misrepresentation, founded on the views of interested parties—for even in New England, certain denominations are chagrined at not being allowed to monopolise the duty of imparting, at the expence of the state, their own peculiar tenets.\* Much, I was

\* In connection with this subject, I may introduce the following passage from the *National Magazine* (December 1853), a respectable periodical published in New York:—'At the present moment an important discussion is going on [in England] in reference to popular education; and the question has been not a little embarrassed by reports from certain sources in this country, that our system tends to a wide-spread and confirmed infidelity, and to great laxity of morals. It is a significant fact, that these opinions have only been advanced by those who were previously committed to the advocacy of parochial or sectarian schools. The discussion has been of great service, however; for it has awakened the community to the importance of insisting upon high moral qualifications in their instructors, and upon decided Christian discipline in the schools. An interesting inquiry, suggested by an English gentleman, was made in reference to the statements above alluded to, under the direction of certain friends of the Massachusetts Board of Education. The object of the inquiry was to discover how many of the attendants upon the common schools were also members of Sabbath-schools, and were receiving religious instruction through this instrumentality. The result reached, by examining the schools in Boston, Lowell, and representative towns in commercial and agricultural districts, was that, on an average, 90 per cent. of all the children connected with the common schools were at the time of the examination, or had been, connected with the Sabbath-school, and were receiving, through this important instrumentality, religious culture. This was, indeed, an unexpected and gratifying result, justifying a remark that has somewhere been made—that the Sabbath-school is the evangelist of

\* Report on Common Schools of Massachusetts, by Horace Mann.

told, is done to extend religious instruction on a footing of kindly interest, by means of Sabbath-evening classes; and so far as I may judge, from what fell under my notice at Boston, an extraordinary degree of attention is given to this kind of instruction by young persons of both sexes, connected with different congregations. I may add, that if the people are not animated by moral and religious convictions, they greatly belie outward appearances; for it is certain that no such scenes of loathsome vice or intemperance are seen in Boston as may be witnessed in the streets of Edinburgh or Glasgow.

I can positively affirm, from personal observation, that, in point of general discipline, the American schools greatly excel any I have ever seen in Great Britain. In Canada and in the States, every suitable provision is made for the purposes of decency—a thing usually neglected in the parish and burgh school-system of Scotland. I was much pleased with the arrangements in the American schools to prevent disorder, or improper interference one with another among the pupils. All are seated at small desks, not more than two together, in rows; so that the teacher can conveniently reach every seat in the school. It is customary, likewise, to cause all the pupils to enter and depart slowly and decorously, instead of being suffered, as I observe, even in some of the more pretentious schools of Edinburgh, to rush rudely out like so many wild animals. In Massachusetts, and generally in the States, the plan of imparting a free education according to abilities, is pursued through several grades—primary, intermediate, and grammar schools, such as have been noticed in New York; and I would, from the bare knowledge of this fact, ask any one to compare so wide a range of instruction at the public cost, with the meagre and antiquated routine of elementary education legally maintained in Scotland, and which some persons complacently represent as the perfection of human wisdom. Boston, with a population of about 150,000, appropriates 330,000 dollars for the support of public schools, being more than a fourth of the whole city taxes; and as the number of pupils is nearly 23,000, the yearly cost of educating each child is therefore about fifteen dollars. In what city in Great Britain could we find the inhabitants voluntarily taxing themselves to give every child an education at L.3 a head? Besides her elementary and advanced schools, her normal schools, and her university, Massachusetts supports a State Reform School at Westborough. It is on the principle of an industrial institution—work of various kinds, including field-labour, being given to the inmates. To this school, young persons from seven to eighteen or nineteen years of age are sent by courts of justice, for petty offences. Of 724 committed since the opening of the school, 115 were born in foreign countries, mostly in Ireland.

Looking at Massachusetts as a small and comparatively sterile state, of only a million of inhabitants, it is matter of astonishment that she does so much for social amelioration. 'For public, free education alone,' says Horace Mann, in the paper already quoted, 'Massachusetts expends annually more than a million of dollars. To support religious institutions for the worship of God and the salvation of men, she annually expends more than another million; and what she gives away, in the various forms of charity, far exceeds a third sum of equal magnitude. For the support of the poor, nine-tenths of whose cost originate with foreigners, or come from one prolific vice, whose last convulsive energies she is now struggling to subdue, she annually pays more than 300,000 dollars; for the support and improvement of public highways, she pays a much larger sum; and within the last dozen or fourteen years, she has invested a capital in railways, within and without the state, of nearly or quite 60 millions of dollars.' Whence comes all this wealth? asks this

fervid writer; and the answer is ready: 'One copious, exhaustless fountain supplies all this abundance. It is Education—the intellectual, moral, and religious education of the people.' I am glad to be able to present this as the opinion of one who may be presumed to be better acquainted with the kind of instruction which is generally imparted, than any stranger who makes a casual visit to Massachusetts.

I have elsewhere had occasion to refer to the general neatness of the dwellings of the operative-classes in America, their self-respect and orderly conduct, their love of reading and anxiety to improve their circumstances; and that these qualities are in no small degree a result of a system of universal school instruction, we have the best testimony in the special Reports of Mr George Wallis and Mr Joseph Whitworth, concerning the New York Industrial Exhibition, laid before parliament a few months ago. A few passages from these interesting Reports may not be here out of place.

Speaking of American workmen, Mr Wallis observes, that no one can 'fail to be impressed with the advantages derived from the long and well-directed attention paid to the education of the whole people by the public-school systems of the New England States and of the state of Pennsylvania. Here, where sound and systematic education has been longest, and, in all probability, most perfectly carried out, the greatest manufacturing developments are to be found; and here it is also where the greatest portion of the skilled workmen of the United States are educated, alike in the simplest elements of knowledge, as in the most skillful application of their ingenuity to the useful arts and the manufacturing industry of their country, and from whence they are spread over the vast territories of the Union, becoming the originators, directors, and ultimately, the proprietors of establishments which would do no discredit to the manufacturing states of Europe.' Mr Wallis goes on to say—'As there is no apprenticeship-system, properly so called, the more useful the youth engaged in any industrial pursuit becomes to his employer, the more profitable it is for himself. Bringing a mind prepared by thorough school-discipline, and educated up to a far higher standard than those of a much superior social grade in society in the Old World, the American working-boy develops rapidly into the skilled artisan; and having once mastered one part of his business, he is never content until he has mastered all. Doing one mechanical operation well, and only that one, does not satisfy him or his employer. He is ambitious to do something more than a set task, and, therefore, he must learn all. The second part of his trade he is allowed to learn as a reward for becoming master of the first; and so on to the end, if he may be said ever to arrive at that. The restless activity of mind and body—the anxiety to improve his own department of industry—the facts constantly before him of ingenious men who have solved economic and mechanical problems to their own profit and elevation—are all stimulative and encouraging; and it may be said, that there is not a working-boy of average ability in the New England States, at least, who has not an idea of some mechanical invention or improvement in manufactures, by which, in good time, he hopes to better his position, or rise to fortune and social distinction.'

At present, a body of operative carpenters in a large town in England have struck work, in consequence of their employers having introduced machinery into their establishments. Facts of this kind continually occurring in Great Britain, contrast strangely with the statements presented by Mr Whitworth respecting the eagerness with which American operatives, through a superior intelligence, assist in promoting mechanical contrivances. He says, 'wherever machinery can be introduced as a substitute for manual labour, it is universally and willingly

resorted to; of this the facts stated in my Report contain many conclusive proofs, but I may here specially refer, as examples, to plough-making, where eight men are able to finish 80 per day; to door-making, where twenty men make 100 panelled doors per day; to last-making, the process of which is completed in 1½ minutes; to sewing by machinery, where one woman does the work of 20; to net-making, where one woman does the work of 100. It is this condition of the labour-market, and this eager resort to machinery wherever it can be applied, to which, under the guidance of superior education and intelligence, the remarkable prosperity of the United States is mainly due.' He afterwards mentions, that 'the results which have been obtained in the United States, by the application of machinery wherever it has been practicable to manufactures, are rendered still more remarkable by the fact, that combinations to resist its introduction are there unheard of. The workmen hail with satisfaction all mechanical improvements, the importance and value of which, as releasing them from the drudgery of unskilled labour, they are enabled by education to understand and appreciate.' Mr Whitworth concludes by saying, that 'the principles which ought to regulate the relations between the employer and employed seem to be thoroughly understood and appreciated in the United States; and while the law of limited liability affords the most ample facilities for the investment of capital in business, the intelligent and educated artisan is left equally free to earn all he can, by making the best use of his hands, without let or hindrance by his fellows. It rarely happens that a workman who possesses peculiar skill in his craft is disqualified to take the responsible position of superintendent, by the want of education and general knowledge, as is frequently the case in this country. In every state in the Union, and particularly in the north, education is, by means of the common schools, placed within the reach of each individual, and all classes avail themselves of the opportunities afforded.' But in the United States there is another element of improvement in ceaseless operation—the press. 'The desire of knowledge so early implanted is greatly increased, while the facilities for diffusing it are amply provided through the instrumentality of an almost universal press. No taxation of any kind has been suffered to interfere with the free development of this powerful agent for promoting the intelligence of the people; and the consequence is, that where the humblest labourer can indulge in the luxury of his daily paper, everybody reads, and thought and intelligence penetrate through the lowest grades of society. The benefits which thus result from a liberal system of education and a cheap press to the working-classes of the United States, can hardly be overestimated in a national point of view; but it is to the co-operation of both that they must undoubtedly be ascribed. For if, selecting a proof from among the European states, the condition of Prussia be considered, it will be found that the people of that country, as a body, have not made that progress which, from the great attention paid to the education of all classes, might have been anticipated; and this must certainly be ascribed to the restrictions laid upon the press, which have so materially impeded the general advancement of the people. Wherever education and an unrestricted press are allowed full scope to exercise their united influence, progress and improvement are the certain results; and among the many benefits which arise from their joint co-operation, may be ranked most prominently the value which they teach men to place upon intelligent contrivance, the readiness with which they cause new improvements to be received, and the impulse which they thus unavoidably give to that inventive spirit which is gradually emancipating man from the rude forms of labour, and making what were regarded as the luxuries of one age to be looked

upon in the next as the ordinary and necessary conditions of human existence.'

It would be easy, if room permitted, to extend our observations on the subject of elementary education in the New England and other states. What has been said is enough to show that in this department of public affairs, the Americans—and I may add, the Canadians—have got completely the start of the people of Great Britain, who indeed, in this respect, are behind the English Puritans of the seventeenth century—behind even John Knox, a century earlier. While generation after generation in England is passing away imperfectly instructed for the present, and as imperfectly prepared for a future state of existence, our American brethren, unimpeded by obstructions of any kind, have shot far ahead, and are carrying the triumphs of free and universal education to limits scarcely so much as dreamed of in this country. W. C.

#### THE TRUTH OF THE MIRROR.

MIRRORS have been in use since the days when Eve made her toilet by the streams of Paradise; and all her daughters—ay, and her sons too, if truth must be told—have resorted to them, whether in the form of the clear fountain, or the polished steel, or the modern looking-glass. But we do not mean to treat of their history or manufacture. We take them as we find them—a necessity of life. What house does not possess a mirror?—from the large cheval mirror, with its gorgeous gilding, in which the high-born beauty arrays herself for the ball, reflecting the floating lace, the wreath-bound tresses, and even the satin-shod feet, down to the little cracked disk, bound with red painted wood, hanging on the wall of the garret where the poor seamstress plies her task, in which she smooths her hair, and sees it growing gray so soon, and in which she looks upon the face of her only friend.

It is not with the outward form, but with the *morale* of the mirror we have to do; and we presume that the morality of a mirror consists in its truth, a virtue we believe capable of producing every other—the quality of sincerity standing highest in our esteem. Many are the accusations brought against the mirror on the score of flattery; but we set them down as altogether groundless. At anyrate, the glass of nature is, we think, more open to this charge than any other. The rustic beauty of whatever clime, who has to rise from her couch and proceed to the fountain before she can arrange her sleep-dishevelled tresses, as she looks down into its watery depths, sees a more flattering representation of herself, in the clear yet softened outline it gives to view, than if she beheld herself reflected in the crystal of the boudoir. Mirrors have been likewise accused of the opposite and far less pardonable breach of truth. Now, we will not deny that there are individuals of the class to be met with, though chiefly of great age and plebeian origin, which have a quite wonderful propensity for elongation and extension of the visage, or of some one of its particular members; and we have met with one which, at a certain point of view, reflected double; but, in general, they bear a deservedly fair character for singleness and truth, so as to render their testimony worthy of credit.

'You are very beautiful,' says the mirror, as one looks into it with glancing eye, and cheek of damask, and brow of snow; and she who looks therein, twines the jetty curl round her finger, and, with a smile that shews the pearly teeth, acknowledges the truth; and

that consciousness makes her lovelier still. It is an exalting thought, that she is the fairest thing in nature; and she can no more help rejoicing in it than the flower can help expanding in the sunshine, or waving in the breeze.

'You will spoil that pretty face and graceful figure with your affectation,' says the mirror to the lady before it, practising attitudes, and trying the effect of various smiles, from the faintest possible motion of the lip, to the teeth-displaying, dimple-compelling laugh; but the monitor speaks in vain, while it mocks her grimaces with its calm clear integrity. She only sees it return her own admiring gaze. Be consoled, good mirror; thou art not the only neglected truth-teller in the world.

'You are very plain, miss,' pronounces the mirror; and the quiet smile that answers says:

'I know I am; but I want to look as well as I can, for all that.' Again the mirror speaks unheeded, while it declares that the glow of inward satisfaction from that unknown deep of beneficence and kindness, or that unacknowledged act of self-denial, has diffused itself over those uninteresting features, and made them almost lovely.

'And you will be an old maid,' resumes the mirror, though with a little shade of hesitation.

'What although?' is the return: 'I think it possible for an old maid to be happy. Affections which have no near objects on which to expend their wealth, need not therefore lack, in a world like this, their legitimate exercise.'

'But if, after all, your affection and your sympathy should meet with no return? if these should be as unsought as your love?' The lip quivered a little, and the eyes were suffused, but the mirror answered itself: 'They will serve to beautify your own soul.'

'You are growing old,' the mirror whispers daily to the man and woman of the world. Oh, would they but listen to the solemn truths it preaches from the text of their gray hairs! But he does not stop to notice the hard lines of eager worldliness that have gathered round his lips and on his brow; and she, whose glass sees her only as she is, as she arrays herself in her false graces, forgets that her life is falselier still.

'You are a villain, and you know it,' frowns the faithful mirror on its *vis-à-vis*. She was a wise mother who brought a looking-glass to her child during a fit of passion, to let her see its deformity in the workings of her face; and let any one come to the mirror after the commission of a deed of meanness, cruelty, or vice, and he will assuredly find an accuser there. We have fancied there was something solemn in standing face to face with ourselves; the facts of our life read strangely in that book; the reflection seems a second conscience. Action always leaves its traces, more or less distinctly, more or less permanently, on the features. Sometimes these traces are gradually obliterated in the lapse of time by means of a change in the conduct and its attendant thoughts; but if no change takes place, the lines, by imperceptible touches, become ineradicable. What are the hideous faces to be met with among the outcasts of society, but extreme examples of this? Men are naturally physiognomists. We remember our own intense predilection in our childhood for those who were possessed of personal beauty, and we believe the feeling is, more or less, common to all children. And though we have since then learned to discriminate better, and to know that moral and physical beauty are often dissociated, we still believe that, however separated for a time, a unity subsists between them which will manifest itself in the end. This we know—a life spent in virtue and benevolence, never fails to make the exterior of the man a sharer in its beauty; the light within radiates outwards,

and penetrates in some measure its veil of flesh; while avarice, harshness, and sensuality never fail, on the other hand, to stamp their degrading impress on the face of age.

## PRIZE-MONEY.

Sweet is prize-money—especially to seamen.—BRYAN.

ACCORDING to an old story, once upon a time a sailor on board a ship just going into action, was observed in an attitude of prayer; and in answer to a question, he made known unto all whom it might concern, that he was praying that the enemy's balls might be apportioned like prize-money—the lion's share among the officers! The joke may excite a curiosity to know what are the relative proportions of prize-money assigned to officers and men. We shall adduce a famous instance by way of answer to the inquiry. In 1799, the four British frigates,  *Naiad* ,  *Ethalion* ,  *Alcmène* , and  *Triton* , captured the two Spanish frigates,  *Thetis*  and  *Santa-Brigida* , bound from Vera Cruz to Spain with specie, &c. The treasure in the  *Thetis*  was worth £311,690; and the other prize contained as much or more specie, besides a valuable cargo of cochineal, &c. The prizes were safely carried to Plymouth, and the treasure was forwarded, with much pomp, to London, and deposited in the Bank of England. The prize-money, exclusive of the value of the hulls and stores of the Spanish frigates, was distributed among the officers and crews of the British frigates in the following rates:—

Captains, - - - -	each	£40,730 18 0
Lieutenants, - - - -		5,091 7 3
Warrant-officers, - - - -		2,468 10 9
Midshipmen, &c. - - - -		791 17 0
Seamen and Marines, - - - -		182 4 9

When a ship is captured, a prize-crew is immediately sent on board to take possession, and navigate it to the nearest available port, where, if it proves a legal capture, it is condemned by the Vice-Admiralty Court, and the vessel and all it contains then becomes the sole property of the officers and crew of the ship or ships which effected the capture. Her Majesty's new order in council, dated March 29, 1854, clearly defines the mode in which the distribution of prize-money is now to be effected:—'Ships being in sight of the prize, as also of the captor, under circumstances to cause intimidation to the enemy, and encouragement to the captor, shall be alone entitled to share as joint-captors.' Such is one of the clauses, and we quote it for the purpose of making a remark on the subject. It is perfectly fair so far as it goes, but it is not comprehensive enough. We understand that considerable dissatisfaction has already been expressed on this point by the seamen serving in the largest ships of the grand Baltic fleet. Their grievance is this: A number of line-of-battle ships cruise twenty miles, it may be, off some port of the enemy; and meanwhile one or two small frigates or sloops belonging to the fleet boldly venture in and pick up numbers of the enemy's merchantmen, which become sole prizes to their captors; for as the line-of-battle ships are not in sight, they can claim no share of the prizes. On the other hand, the frigates and sloops dared not have gone inshore to seize their prey had not the line-of-battle ships been in the offing—a fact which, of course, served to intimidate the enemy, and prevented him from sending forth his own ships-of-war to resist the English frigates. It really is as though the jackal seized prey in the name and by the authority of his patron the lion, and then impudently kept all for himself! In a sea so shallow as the Baltic, huge ships of twenty and five-and-twenty feet draught cannot possibly run inshore to pick up prizes; and unless an action takes place on a large scale, the jackals will wax fat, whilst the lions famish! As concerns the residue of the order in council, we need

only mention here, that after providing, in the usual manner, for the right of the *flag*—or commanding-officer of any fleet, squadron, &c.—the residue of the net prize-money is divisible in ten classes: the first class receiving each person forty-five shares, and so on to the tenth class; namely, youngest boys, who receive only one share each. Government also pays *head-money* for taking, sinking, burning, or destroying ships of war or privateers of the enemy—that is, so much for each of the enemy's crew who are proved to have been on board at the commencement of the engagement. We have read that the French used to pay, according to their prize-law, the sum of 3500 francs for each long gun or carronade on board any of our men-of-war captured. We may also here add, that when an English man-of-war on a cruise or a station in war-time, fits out a *tender* or small vessel, and sends it forth to cruise for the enemy's merchantmen or privateers, all the prizes made by this tender are shared equally with the crew of the man-of-war to which she belongs. Mr James, the naval historian, has noticed this, and justly observes, that 'it is not the sole misfortune under which the commanding-officer of a tender labours, that, while he incurs all the risk and all the responsibility, he only shares prize-money as one of the lieutenants of the flag-ship: the case is harder where that flag-ship remains idle in port; otherwise the prizes she might make by cruising would perhaps afford to the tender's commander a counterbalancing advantage.' By the new regulations, the common seaman's share of prize-money is increased. If the law continues as it was formerly, Greenwich Hospital receives a percentage on all prize-money, and also from unclaimed shares, and shares belonging to men who have deserted.

When a prize is carried into port, it is put in the hands of a *prize-agent*, whose duty it is to see to her condemnation by the court, and to effect a fair and proper distribution of prize-money among the captors, from the sale of the hull and all it contains. Many of these prize-agents, during the last war, realised immense fortunes by iniquitously abusing their very responsible trust. They made enormous overcharges for their services, and in various other ways scandalously robbed both officers and men of that which they had won at risk of life and limb. At length, in 1811, Mr Geo. Rose, of the Navy Pay-office, exposed their doings to the Lords of the Admiralty, and brought to light almost incredible delinquencies, as we learn from copies of his official letters lying before us. In one case—that of a Russian frigate and store-ship, detained by the fleet at Spithead—the net sum to be distributed as prize-money was £73,000, and the agent charged no less than £9306, 6s. 9d. for his labour! He was compelled to refund £6680 of this, and to pay all costs of the suit-at-law for its recovery. This was by no means an unusual case. Some prize-agents managed to pocket more than one-half of the money passing through their hands. Enemy's vessels captured on foreign stations were condemned there by courts appointed for the purpose, and the captors were fleeced of their prize-money by agents and proctors in much the same manner as in England. During the first eight years of the war—1803 to 1811—about 6000 vessels were condemned as prizes in Great Britain, and at least 3000 were similarly condemned in colonial jurisdictions. Prizes to the amount of a million and a half sterling were, on the average, condemned annually. So systematically did the prize-agents, &c., at some foreign stations, pocket the greater portion of the net proceeds from condemned prizes, that Lord Cochrane declared in the House of Commons, when moving for the production of returns relative to the Admiralty Court at Malta, that it was hardly worth while for English cruisers to seize the vessels of the enemy, and to risk the expenses of their condemnation, &c. He shewed the House a Malta proctor's bill, which measured *six fathoms and a quarter*

*in length!* He said that this person acted both as proctor and marshal of the court, and 'in one character charged for attending on himself in the other!'

In numerous cases, when a prize was legally condemned, years elapsed ere any distribution of the proceeds was announced, and in the interval, very many of the claimants for shares had died, or were scattered over the globe. We have a curiously constructed table before us, shewing the distribution of prizes from 1803 to 1810. We perceive that the proceeds of eighteen prizes taken in 1803, were not distributed to the captors till the seventh year after capture. How many men survived to receive their shares in this instance? At the time when the distribution was advertised, how many were at home to receive their due? When the *Rattlesnake* returned home in 1811 from the East Indies, only one man of her original crew remained in her: death, removals, and desertions had disposed of all the rest. But the prize-agents had a short and easy method of providing for such contingencies. They used to persuade ignorant seamen to make wills in their favour, and in this way alone reaped much ill-gotten gain. Mr Rose says, in one of his letters to the Admiralty, that 'one agent for seamen, resident near Chatham, had wills by him with his name printed on them as the *friend of the persons who were to execute them*; and this man lately produced at my office a will made by a private marine, bequeathing to him £180 personal property, besides all his pay, prize-money, and clothes, although he had a brother and two legitimate children living.' This will was legally executed; but Mr Rose managed to induce the cormorant agent to surrender his claim in favour of the orphan children of the deceased marine.

We have given the above details relative to the gross malversation of prize-agents in the last great war, principally to shew how our seamen were formerly plundered on every hand. Thousands of poor fellows fought desperately, and huzzaed when the enemy's colours came down, fancying they had won ships which would yield them plenty of prize-money, when, in reality, they had only risked their lives to enrich an agent living like a lord on shore; and the odds were ten to one that poor Jack himself did not live to touch a dollar of the thousands he had won by his skill and valour. We presume that a very different system will prevail during the present war. It surely is not too much to expect that the government will take care that captured vessels are adjudicated with the least possible delay, and, if condemned, their proceeds promptly distributed in an equitable manner, instead of melting away in the hands of unscrupulous agents. Worse management than prevailed fifty years ago is scarcely possible. In 1810, the proceeds of thirty-seven prizes were advertised for distribution, which had been withheld from nine to fifteen years, owing to the cupidity of the agents!

#### PLIGHTED TROTH.

ALTHOUGH every day, and almost every hour, a Flemish *ménage* is scrubbed, scoured, waxed, and put in order, the Saturday is not the less consecrated, from time immemorial, to an especial cleansing, which, though nearly useless, is nevertheless accomplished with singular punctuality and fidelity. Floods of water deluge the red slabs of baked earth that compose the paving of the apartments; and when the busy housewives cease at length to lash the water with their brooms, considering that they have done their duty by the floors, they then fall upon the furniture and utensils. Bath-brick replaces water; and with the aid of a few soft rags, every door-handle and copper

sauce-pan assumes the appearance and the brilliancy of the most precious metal.

It was in such labours that old Brigitta, who had been in the service of the Schaurmans family thirty years, occupied herself one Saturday with unrelaxed solicitude and perseverance. The object of her especial care was an enormous skuttle of fine copper, in which, so bright was it with incessant polishing, were reflected the smallest details of the court in which Brigitta was engaged at her task. What does the active servant behold in her copper mirror, that can cause her to start so violently, and gaze upon it with so blank a countenance?

The reason of her dismay was this: at one of the windows of the house, to which her back was turned, but which was clearly reflected upon the skuttle, she observed her young mistress in the act of leaning towards a young man, and allowing him to kiss her forehead. Then the indiscreet mirror shewed the thoughtless couple exchanging rings, kneeling side by side, and holding their hands towards heaven.

What would people say if it ever got to be known in the town of Swal? The daughter of the richest citizen of the province of Overysel to love a poor painter without fortune and without reputation! What was to be done? Ought not Brigitta herself, like a faithful and devoted servant, acquaint her master with what she had discovered? But this would be to betray a secret she had arrived at accidentally—a secret, too, whose revelation would entail tears and endless despair upon her dear young mistress. The old merchant, her father, would doubtless be pitiless, and conduct himself with the utmost rigour towards her. Brigitta's tears fell upon the brilliant skuttle, where they glittered like pearls. The good woman wiped them away, re-entered the house, and busied herself in preparing the family-supper. While thus occupied, her mind unceasingly dwelt upon the scene of which she had been the involuntary witness. Nightfall came at length, and she ascended to Marie's chamber, where she found her young mistress without a light, and sobbing violently.

'What is the matter, dear child?' asked Brigitta compassionately, pressing the poor girl's hand.

'Oh, my dearest nurse, it is a very sad secret, that I dare not confide even to your tenderness. Brigitta, listen—O no! no! I dare not.' And Marie hid her face on the bosom of the old domestic.

'Well, to save you the pain of confessing your secret and your fault, dear, I will tell you that accident has discovered to me the love with which you have inspired the young painter. I saw you this morning allow him to take a kiss; then you exchanged rings; lastly, you prayed and wept together.'

'You know all, Brigitta! How is this? Never has a single word of tenderness escaped the lips of Gerard Terburg; only for some time he has been exceedingly absent and melancholy. To-day he said to me: "I depart to-morrow for Spain, there to make myself a name, to become rich, and then return to Flanders for a wife." At these words, I nearly fainted. He continued: "For all this, four years are necessary. If you were the young girl whom I love, would you have confidence in the success of the poor painter? Would you wait four years to become his wife?" Then I leaned towards him, Brigitta; he kissed my forehead; we exchanged rings; we prayed and wept together.'

'And messire your father, mademoiselle, what will he say to all this?'

'I shall hide my secret until Gerard's return.'

'But if your father should decide upon marrying you?'

'I shall refuse all proposals of the kind.'

'But if he insists upon obedience?'

'I shall die!' cried the young girl with the resolution of despair.

Brigitta, as might have been expected, became from this time the consoler and confidante of her youthful mistress. It was to Brigitta that Marie related all her inquietudes; it was to Brigitta she would sometimes say: 'My father has this evening proposed another lover. I have refused, and have had to endure his anger and his complaints.' The good servant was not merely a passive recipient of Marie's confidence, she had likewise become the accomplice of her love and her resistance. She even partook of the affection of the young enthusiast for her absent lover, whom they now expected daily, for the four years had at length expired.

But, alas! Terburg did not reappear. Marie was at first devoured by anxiety, then resigned herself to despair; for thus to fail in the sacred promise he had given, her lover must be dead. Brigitta endeavoured to combat this belief, while adopting it as the sole probability; for the idea of treason or forgetfulness on the part of Terburg could not occur to the pure and upright imaginations of these two simple-hearted women.

However the case might really stand, Marie's despair merged by little and little into a species of gentle and resigned melancholy, which, nevertheless, totally precluded the idea of her forming any other engagement. She dismissed all suitors for her hand as she had formerly refused the lovers presented by her father, for the old gentleman had died five years after the departure of Terburg. Free to please herself, she resolved to devote to celibacy the life which she had not been able to consecrate to the happiness of him whom she yet loved, and whom she believed to be in heaven, with her father. Like all tender, deceived, or isolated souls, she found in religion a mysterious solace for her woes. Her immense fortune was devoted to works of charity, in which she had a zealous coadjutor in Brigitta, who grew old without becoming infirm. Together they visited the poor, and spread around them happiness and ease by large and judicious alms. Every one in the little town of Swal knew and loved the *Demoiselle Schaurmans*.

Forty years thus elapsed. Brigitta was now ninety; and the pretty little fair-haired Fleming, whose graceful features had formerly been reflected in the copper mirror, had become a sober personage of fifty-eight years, whose plump figure harmonised in the happiest manner with her benevolent physiognomy. However, neither this *embonpoint* nor the great age of Brigitta had had the power to deprive the two women of any portion of their activity. This was still so unimpaired, that towards the autumn of 1678, they undertook a journey to Haarlem upon we know not what business.

There they alighted at the best hotel in the town. But, unluckily, all the rooms were occupied, with the exception of one, which was disputed by a traveller who had arrived at the same time with *Mademoiselle Schaurmans*. He was a blunt little old man, and not at all disposed to cede his rights. *Mademoiselle Schaurmans*, habituated in her small town to the deference and the regard secured to her by her large fortune, and the respect her character inspired, was much wounded by the rudeness with which the stranger insisted upon his claim; and Brigitta could not refrain from observing aloud, that a lady being in question, it was the duty of a polite man to yield his rights, if he had any, to her mistress.

'At our age,' replied the contradictory old fellow, 'there is neither sex nor gallantry. We are two old people, that is all; we need the same cares. A bad night would be equally disagreeable to me as to

madame. I have a right to the chamber, and I shall keep it.' So the two tired women were compelled, at eight o'clock in the evening, to seek refuge in another hotel, where they arrived shivering with cold, and in the worst possible humour.

'Well, indeed!' exclaimed Brigitta, as she examined the mattresses of their beds, which were hard and uncomfortable; 'what a brute that man is!'

'I never beheld a more ugly and disagreeable countenance,' said her mistress.

'Such a singular appearance, with his toothless mouth, his bald pate, and his great gouty feet!'

'We are two old people,' said he. Like his impudence! to compare a woman of fifty odd to an old *podagre* of eighty at the least.'

'Yes, he is most disagreeable. I am certain he can never have been supportable, even in his youth.'

'From the moment I entered the hotel, he inspired me with instinctive aversion.'

The stranger, on his part, expressed himself with no more moderation than the two females. 'Upon my word,' he said, 'to be expected, for the sake of a fat old woman like that, to put myself out of the way, and expose myself to take cold. It would comport well with my age and appearance to commit such a folly!'

His valet-de-chambre interrupted him in the midst of these uncivil reflections. 'The ladies that have just left,' he said, 'have taken with their own luggage one of your cases by mistake; and I believe it is the one containing a picture.'

'My picture!' cried the old man—'my picture! probably my best! The only work of my youth I have preserved. Run, Pierre, run to the neighbouring hotel, where these two old women are lodged. Stop: I will go myself.' And with the vivacity of a young man, he took his stick, and went hastily to the two ladies. Entering without any announcement, he found them in tears.

Like worthy daughters of Eve, they had opened the case. The picture therein contained represented the farewell that had taken place forty years previously between Gerard and Marie. Mademoiselle Schaurmans and her ancient lover regarded each other for a long time in silence, without being able to discern in the withered visages of either any trace of the features so lovingly preserved in their remembrances, and still doubting whether they really stood before each other. Then they approached, and joined hands. 'Marie!' exclaimed Terburg, falling on his knees before her, 'can you ever forgive me?'

'Alas! what matter,' exclaimed she with a calm joy—'what matter at our age the past follies and errors of youth? I find only a friend, a brother. Thank God for it!'

'A husband, Marie! Why not realise now, old as we are, the dreams of other times?'

'O no—no!' murmured the comely old lady, a slight flush suffusing her still smooth cheek. 'There is no marrying nor giving in marriage for us. The feelings of the past cannot be revived. What have you or I to do with love?'

The old painter would have sued, as if he had still been the handsome youth of other days; but Mademoiselle Schaurmans was firm. Brigitta supported her mistress in her resolution. So M. Terburg was fain to put up with friendship instead of love. He followed his ancient mistress to Swal, and there took a house in the same street with hers. The friends saw each other daily, enjoying the tranquil happiness suited to their age and increasing infirmities. They died within a year of one another, and were buried side by side in the old church-yard.

Brigitta, their heir, caused a magnificent monument to be erected to their memory, and shortly afterwards

provision for the numerous pensioners of her beloved mistress. The poor and infirm of the town of Swal had reason to bless the foresight which, continued to solace their afflictions for more than a century.

## BORROWING AND LENDING IN OLD TIMES.

It may be worth while—when the actualities of the credit-system are so intimately connected with our polity, public and private, when the existence of every nation and every individual is constantly under the influence of what is owing on one side or other—to take a short survey of the march of borrowing and lending. It must have been an awful moment when the earliest debtor pledged himself to the earliest creditor: a Greek poet would have sent the streams back to their sources, bowed the forests, and brought flames from the mountains at the tremendous juncture.

The old Romans, when they found their debts peculiarly oppressive, usually took the matter into their own hands—they retired to the Mons Sacer, or raised a tumult, which commonly ended in a special insolvent debtor's act, intended only for the moment, like our wise measures of the last century. It is intelligible that in those days, when such matters were managed by a small revolution, debtors should get relief by fits and starts; but in our times, when a peaceable parliamentary act did the business, why insolvents should be released in the year of grace 1766 or 1788, rather than any other year, is a question only to be answered by the wisdom of our ancestors.

Sometimes the thing took a different turn. A centurion once was hauled off for debt, when Manlius, the conqueror of the Gauls, rushed into the crowd, exclaiming, that he had not saved the Capitol with his own right hand, in order that a fellow-soldier should be chained and marched off, as if the Gauls had been the conquerors. What could these have done more? was the idea of the honourable and gallant general.

In those days, imprisonment for debt—although it had a good many harsh conditions—was at least founded upon a sensible principle. The debtor was, at any rate, not shut up in a common jail, where he could be of no use to himself or to any one else. He was taken off to his creditor's house, and there made to work out the debt by manual labour. There is something comprehensible in this. Senates were ever the great jobbers, and the senators were the general creditors; hence a senator's house was known as the private prison. The creditor's abuse of his privilege brought about an abolition of imprisonment for debt—things ran before our era in the same rut in which they have run since—and then, as now, the abolition was merely nominal; it contained provisions and exceptions, which enabled creditors to imprison very nearly as before.

The money-lenders at Rome had no *Times* in which they could advertise 'advances to noblemen and gentlemen on personal security;' but they could stand in the Forum, and offer their coin to the passers-by—a more tempting lure to ruin to the heedless even than an advertisement. What spendthrift could resist the sight of the yellow metal, or hear the chink unmoved? No creaking stairs to mount—no grim clerk to face—the money amiably and invitingly brought under your very nose. They had a thriving business, those Roman money-lenders: the legal interest was one per cent. per month; but all the laws in the world could not restrain it within this limit.

The business of debtor and creditor became, in consequence, a matter of state; the debtors formed one section, the creditors another; and a judge, supposed to be favourable to one party, sometimes paid the penalty of his life. Every now and then the circum-

frightened by the amount of private debt—new regulations were established—the immediate difficulties postponed—people got tired of the subject—and all went on just as before. But, it should be observed, almost the entire debts of those times were due to the money-lenders; credit scarcely existed amongst the tradesmen. Why should it? A man who could not get credit from a lender, whose profession was credit, had no business to ask credit from a baker, whose profession was baking. The latter was not up either to the present or the future steps of the loan-system; and he very wisely left them to those that were. As for the merchant, his business was merely barter, without any risk except from the north wind; speculation, as we understand it, was unknown, and with it the concomitant debts and liabilities.

The usurer, notwithstanding his greatness in Rome, was singularly obnoxious to the laws. 'The thief is to restore double—the usurer fourfold—of the value taken,' was one of their maxims. Cato put a usurer in the same category with the assassin, and would visit him with the same punishment. This unfortunate member of society fell, besides, under the ban of the poets, comic and didactic, who both found the usurer of wonderful utility in pointing their morals and adorning their tales. This did not prevent him from being a personage of immense influence, and able in other ways to console himself for the sibilations of the populace, than by counting his coin at home. In fact, he had all the great world to keep him in countenance. The proconsul proceeded to his province—levied exorbitant taxes which the inhabitants could not pay—and gave them time, at eighty per cent. The proconsul's son remained at home—outran his allowance—and borrowed of the usurer at fifty per cent. The latter transaction might be the most convenient for the satirist; but for the moralist, it is infinitely the less questionable of the two.

After all, debt was the exception in the ancient world; it became the rule in the modern. Spendthrifts and oppressed provincials borrowed in the one; all the world borrowed in the other. We know not the extent of credit amongst the Goths and Vandals in their primeval forests; but no sooner had they emerged from them, than we find kings and nobles, priests and clergy, merchants and artisans, incessantly working up credit of all kinds. It took a thousand years after the dawn of the old civilisation to produce the usurer, and he was then a rarity. It took a very few centuries after the dawn of the new to produce bankers and pawnbrokers, Jews and Lombards, and these were anything but rarities.

The grandest instance of a growing debt upon record is that of the king of Leon, mentioned by Mariana. Ferdinand Gonzalves had sold this prince a falcon upon credit. The interest was high, and it compounded itself in the course of a few years into a sum so enormous, that the king was forced to make over to Gonzalves his rights on the kingdom of Castile, to be quit of the liability.

But it is no wonder if the debts of the middle ages were on a grand scale. Neither king nor subject knew his income. The subject was to-day master of an estate, was driven out of it the next by an invading monarch; recovered it again by deed of gift; then pawned it to go crusading to the East; regained it by a wealthy marriage; lost it by a divorce; obtained it again upon petition—and lost it finally because he trod on the toe of one of the king's favourites when out of humour. For the monarch—whether the sum wanted was for some private caprice, or the urgent necessities of the nation; to buy a new suit of tapestry, or undertake the most necessary war; to pay for a new house for his mistress, or to build a fortress or a cathedral—he had just the same trouble in convincing his loyal subjects of the utility of his demand. In

consequence, he ran into debt, trusting to the necessity of the case for getting him out—a worthy example, well known to builders of churches and philanthropic societies of modern times. In fact, it has been said that no society can be called really flourishing in Great Britain, till it is a hundred thousand pounds in debt. The complexity of the modern system began early. Complexity is a Gothic principle, to be found in its constitution, its buildings, its trade; and it thus commenced the credit-system, which soon learned to grow by its own force.

During the middle ages, the credit-system was made, in France more especially, a matter of obligation. The feudal lords had the right of demanding it. The abbot of Compeigne enjoyed by royal charter the privilege of receiving flesh, bread, and fish from the inhabitants on credit for three months: if he failed to pay, they were not bound to furnish him any further. The Count of Montfort used to compel the people of Dieppe, by feudal ordinance, to give him fifteen days' credit during the time he resided amongst them. To be sure, the sum on credit was limited to fifteen livres, which would not make a terrible show before an insolvency commissioner. One wonders whether the inhabitants were as anxious for his lordship's custom as a modern tradesman, or whether they served him with sour bread and stale eggs, to induce him to transfer his favours elsewhere. The king himself had the right of credit in many localities, and what was odd enough, many of his nobles had the same right in the same localities for a longer period. He was often forced to give security, as were the nobles. In some places, when the lord visited a town, he had unlimited right of credit till he left it. At Poiz, in Picardy, the lord had the right of credit from each individual once in his life, but not oftener, and then only to the value of twopence-halfpenny. When the dealers concealed their goods, they were liable to a fine. The *coutumes* of the French provinces are full of these regulations. The archbishop of Vienne was expressly precluded from all right to demand credit. It might be curious to trace the origin of this flaw in archiepiscopal trustworthiness.

#### FOUR YEARS.

At the midsummer, when the hay was down,  
Said I, mournful: 'Though my life is in its prime,  
Bare lie my meadows, all shorn before their time;  
Through my scorched woodlands the leaves are  
turning brown,  
It is the hot midsummer, when the hay is down.'

At the midsummer, when the hay was down,  
Stood she by the brooklet, young and very fair,  
With the first white bindweed twisted in her hair—  
Hair that drooped like birch-boughs—all in her  
simple gown;  
And it was rich midsummer, and the hay was down.

At the midsummer, when the hay was down,  
Crept she, a willing bride, close into my breast;  
Low-pled, the thunder-clouds had sunk into the west;  
Red-eyed, the sun out glared, like knight from  
leaguered town,  
That eve, in high midsummer, when the hay was down.

It is midsummer, all the hay is down;  
Close to her bosom press I dying eyes,  
Praying: 'God shield her till we meet in Paradise;  
Bless her, in Love's name, who was my joy and  
crown;  
And I go at midsummer, when the hay is down.

## THE EVILS OF LIFE.

Most persons regard the evils of life as a fixed quantity. To resist or lessen them seems hopeless. They fly to the virtue of resignation as next to a cure. Let us not undervalue or sneer at resignation; often, indeed, not to be very easily distinguished from fatalism, but more frequently a beautiful and amiable—in a word, a religious sentiment. Let us, however, combat the idea, that evils are either fixed in amount or necessary. In reality, in the progress of society and of individual enlightenment, they are continually narrowed within less and less space. Vigilance, knowledge, prudence, are so many enemies constantly busied in cutting them off, or preventing their existence.

Let us take into consideration one evil of a very painful kind. We see a worthy couple doing their best to rear a young family to maturity. They rejoice in the smiles of children, and their house is full of young life and its hopes. But one after another of the young people, as they reach a certain age, manifest a tendency to decline. It is found that a phthisical disease, with which the mother is partially affected, and which is known to have made great ravages in her family, is now beginning to shew itself in the constitutions of these once hopeful children. The eldest-born sinks, and has his share of bewailment. Another, if possible more loved and more grieved over, follows. In short, one after another, this family fades away, leaving the parents at last utterly desolate. Nothing can be more affecting than this—nothing can make a greater demand upon the sympathy of friendly neighbours. We feel bound to offer every suggestion of religious consolation to the hapless pair. It seems ~~wrong~~ to hint, in the faintest manner, that they ~~have in any degree~~ been the cause of drawing such a ~~heart-break~~ upon themselves; and yet, when we take ~~an extended~~ view of the case, we can be at no loss to see that, with judicious forethought, the calamity might have been prevented. There being hereditary predisposition to disease in the mother's family, it was wrong for her to put herself in a condition to extend the evil into another generation—~~wrong~~ both with regard to her own future happiness and that of the person proposing to be her husband. A kind of duty not yet much reflected upon is here brought before our attention. Some will scout the possibility of such foresight giving a guidance to conduct; but they are undoubtedly in a mistake. There are many men and women known to us who act upon this maxim of a high morality, and who are, accordingly, safe from such wringings of the heart as we have described. Some will feel little disposed to sympathise with a sense of duty so extremely refined, and which resists such

universal natural impulses. With that style of feeling we cannot contend. We must rest content with the conviction, that whatever a sense of right and wrong towards others bids to be done or left undone, ought to be done or left undone accordingly, even though it affects a question of marriage; and happy are they who in such cases can give obedience.

An immense number of other calamities connected with disease, are now clearly seen to be preventable; all that is required for this purpose being an observance of the conditions and rules of health. Pestilence and fever are themselves but expressions of erroneous conditions of life. Let these conditions be reformed in accordance with the laws ordained by Providence for human weal, and the diseases vanish. The astounding fact, that half the children born in most communities die under five years of age, in like manner only exposes extensive systems of mistreatment of children, and the too general subjection of the young to influences which work injuriously. If those systems of mistreatment, and those noxious influences, were replaced by others of a healthy kind, the groans and cries of mothers would be immensely abated. Beholding, sympathetically, the calamity when it comes, we feel that it were a kind of cruelty to a bereaved parent to point out how the lost one might have been preserved, or even to intimate the general fact, that such calamities are preventable. But we also feel, on the other hand, that this tenderness to those who are afflicted, ought not to be carried so far as to keep knowledge from those who may be so. There is a duty to the living as well as to the dead.

There is a great and well-known range of evils which may be comprehensively grouped under the one bitter word—Poverty. They have always been, and, we may well believe, they will ever in some measure be. But the evils of poverty are no more, in any case, necessary or unavoidable than those of disease. Look at the grim evil in any of its shapes, thoroughly scan it outside and in, and you will always find that it depends on circumstances more or less accidental and liable to be altered. Mr Mayhew and Mr Godwin have described the hosts of the London poor in the most striking manner; scores of thousands of people, not regular artisans or labourers (they are comparatively an aristocracy), but persons engaged in mean street-traffic and supplying trifling articles to those who may need them; bivouacking, rather than lodging, in wretched half-furnished or unfurnished houses, half starving upon miserably small gains, and often wholly without means of livelihood. It is the extremest and most distressing picture of poverty we could see, perhaps, anywhere on earth—far beyond anything that ever was presented in our northern land, once considered so beggarly—

throwing wholly into the shade any kind of misery that ever occurs among the North American Indians. One is apt to suppose this poverty and misery to be past hope. Well, we do not say that it could be easily remedied; but neither can we admit that it is necessary or unavoidable. When a philanthropic visitor goes into some unplenished den, and finds a family living in wretchedness, it does not seem ever to occur to him to ask how it happens that this husband and father can do so little good in the world. He has a brain and hands—wonderful things when rightly directed and used. Why does this poor man not turn them to account? Most probably, he is an utterly ignorant man, who does not know how to use his brain and hands to any good account; who thinks, if he goes out every day with a few bunches of radishes, and tries to sell them, he is doing his duty—trying to turn an honest penny, as he calls it—while he is only trifling away his time and misusing his natural powers. Perhaps his error consists in refusing to move to a place where his exertions, being called for by his fellow-creatures, would be sure to turn to his own profit, instead of being here mispent in a scene where they are superfluous, or come into collision with the exertions of others better qualified than he. Such a man cannot but be poor, and poor he will be while he continues to make such a wretched use of the wondrous faculties for good with which he has been endowed. But let this man be instructed, so as to see that it is possible to be very busy with nothing, or to be trying to do *something* in a wrong place, and he may have a chance of succeeding somewhat better in the world. Our poor man may be not devoid of abilities and knowledge, but wanting in industrious habits and all right discipline of mind; which comes to nearly the same results as ignorance. He will, of course, have been continually losing situations and failing in business adventures, till he at length has lost all hope, and begun to let things go as they will. Now, this man might also have been saved from poverty, if from the first he had been subjected to proper training, and made to see that nothing could affect his fate but his conduct.

Lord Ashburton, in a late remarkable speech, asked, why is it that one family can live in abundance where another starves? Why, in similar dwellings, are the children of one parent healthy—of the other, puny and ailing? It is not, he answers, luck or chance that decides these differences; it is the patient observation of nature, which has suggested to some gifted minds rules for their guidance which have escaped the heedlessness of others. His lordship instanced a village-dame who had lately been heard observing: 'I should like to know why they have gone and raised the price of bread?' 'Is it right,' asks Lord Ashburton, 'that the poor should be left under the impression that they owe the price of their bread to the baker or the government, the price of their labour to the free-will of their employer?' Beyond question, a vast proportion of the ills that afflict humble people is traceable to simple ignorance—and ignorance, we know, can be exchanged for knowledge and reflection.

An immense class of evils are those which depend on troubles in worldly affairs. Men *will* spend more than they ought to do. They *will* take no heed for tomorrow. And they suffer the well-known consequences. The proper course for avoiding such evils is plain before us all—plain to triteness—no one can have the excuse of saying that he had no reason to foresee the danger of a misrelation between his desires and his means. If any one, then, does transgress in this respect, he should be prepared to think the penalty no evil; otherwise, he can only be regarded as a fool. The one point, however, which we are here called upon to consider, is the fact, that this class of the evils of life is preventable. Let the reckless study and follow the

example of the wise, and, by universal acknowledgment, they are safe.

Not merely among the poor and so-called uneducated is there much evil incurred through ignorance. It could easily be shewn, that the classes which consider themselves as educated, have the whole texture of their life spotted with troubles and distresses in consequence of precisely this—that they have no distinct idea of what this world is, and their situation in it. Some know that there is a physical mechanism of the universe, which goes on under fixed laws of divine appointment, but are not aware that there is a moral mechanism likewise, of precisely similar character, so that every movement of their nature, every social process and transaction, has its own definite and inevitable consequence, for the good or evil of all concerned. Men, in general, wander through life as they would ramble through a forest in an unexplored country, taking their chance of what they may fall upon, or what may befall them. Were they well informed on the subject, they would know that at every step they take they form relations to circumstances; all of which relations are capable of being precisely ascertained, and which, according as we understand and act by them, may serve to make our course happy or otherwise. When this general truth shall be known to the bulk of society, men will have clearer conceptions of what is required of them, in duty to themselves and their fellow-creatures. They will feel, for the first time, the true force of the maxim, that as they brew they must drink, no penalties being ever remitted in the system of Providence.

## CHANGE FOR GOLD.

### IN TWO PARTS.—PART I.

No man knoweth me, whence I come, or who I am. My brother met me yesternoon, and brushed my shoulder; I looked into his eyes, and he into mine, and we walked on our diverse ways like strangers; my mother mourns her dear son yet, that died twelve years ago, and yet he lives, and has been in her company, and shaken friendly hands with her not six months back. My wife—who, since I married her, has become the widow of another man—I saw this very morning, beautiful, still beautiful; and with a word I could have crushed her heart and turned her brown hair gray. To myself, I seem to have two separate beings: my first existence still is in my every thought, and usurps heart and brain; my second self—my present—dwells in my frame alone, rules my mere outward action, and is loathsome and contemptible to my whole soul. I write this life for more than common eyes, for an end, too, I yet half dread to contemplate, so fearful, nay, so fatal, may be its consequences. But to the general reader, shocked at my strange narration, and disbelieving in its awful truth, I would say: 'Beware, lest you, too, suffer through a like unrest; beware, lest some foul fiend be tugging at your heart-strings, and leading you, satiate, from the broad highways of duty and honour, to that isolated place which I have reached at last, where lover and friend have forsaken me, and kinsmen stand afar off.'

I was born in the far north: in Shardale, fairest valley in Westmoreland, guarded by the mountain genii, and quite secluded from the hum of men, my father built his home. His whole life long had been employed in commerce, and that so busily, he hardly had a thought apart from it: a prudent man, and well to do, such as had worship and honour in his native town of Liverpool, even to the statue-length: an effigy in stone of my deceased parent is indeed painfully obvious in one of its public edifices. His neighbours thought him mad, who, at the green age of sixty-five, removed himself so suddenly to Shardale, and dug and stretched

himself for ever in that living tomb. It may have been that the same wild whim and impulse which has cursed my every step, and ruined me at last, was latent in my father too, and came to light at that one single epoch.

His affairs were wound up in about a week; every tittle of his interest in the great firm of Branksome & Co., of which he was the head, disposed of; his connection with all his former associates entirely cut off; and never, to my knowledge, did he receive, or at least reply to, a single business communication of any sort or kind for the remaining five years of his life. He came from his city-home a stern, almost morose old man; whom his family had never seen from breakfast-time to dinner all his days, whose talk had been of stock, and whose thought had been of stock from youth to hoary age; and from the hour of his arrival in the valley, he never missed a meal with us, until his last sad illness; nor ever read a column of 'Money-Market' and 'City Intelligence' again. He took myself (his eldest son James), and Charles, my brother—youths of twelve and eleven years of age—a mountain-walk soon after sunrise throughout the summer, with a more sprightly step than ever left the Stock Exchange: his conversation was as that of a boy to boys, and that not gradually and induced, as might have been expected by a novel life, fresh air, and genial exercise—but at once; and so it remained for ever.

His heart expanded beneath the influence of those glorious scenes, as though it were a child's, and never had been dried and withered in the heat of bustling life, or blunted by the hardness of its fellows, or chipped away by contact with hard and bitter men's.

I look back on those mornings now with the regret, almost despair, of a fallen angel. The one delight that yet is left me is to revisit those bright scenes again, to tread once more the summits of those hills, and see God make himself 'the awful rose of dawn'—in solitude—a melancholy pleasure, that draws tears

To glad the withered thought, and clear the clouded brain.

Only on the tarn upon the mountain-top I dare not gaze—only where the old man and his two happy sons stood mirrored in the flood, I dare not stand. What hideous metamorphosis! what dreadful change should I not see hath fallen upon one of them—worse than the mouldering bones and eyeless sockets that have long ere this replaced the stalwart form and the still radiant look of him I once called father.

My love for nature, though more or less at different times, is still the one steady desire of my soul; often rising to passion, it never has sunk to indifference; and of any thing or creature under heaven, I scarcely dare to say that much. My fickleness in other things, my fatal changefulness of heart exhibited itself first towards my darling sister. She had been away from all of us, for her health's sake, in Madeira, until we left Liverpool, but at Shardale we thought it safe that she should come home amongst us; and she did come—to her grave. So beautiful, so glorious a being my fancy never drew in dreams; that voice I do not think could be ever otherwise than gentle, that placid brow ever tortured to a frown: we all loved her from her first fairy kiss—for she was too delicate and fragile to be called woman—but I may truly say my love was doting. Ah! miles and miles of mountain by her pony's side have I walked on untiringly and gladly, leaving her an instant for some lofty peak, to see if there were view enough to tempt her thither, but else keeping as closely to her side as lover, loud with the poems she loved best—war-songs, the stormful roll of battle, were the favourite strains of that weak, loving girl—learned long and late to please her, full of the legends of each rock and tarn her ear delighted in, and ready to lay down limb and life at any time to serve her.

Our Ellen lived here but sixteen months before the death-flower blushed upon her cheek; she died, I say,

in less than two years of our first meeting, and I was not beside her death-bed, though I was in the house, nor cared to hear her dying words, although the last prayer she uttered was for me. Never was that artless manner less kind to me than of old; never were those lips pressed unto mine less tenderly; but ice formed round my spirit from within, and numbed the grasp of my cold hand, and froze the tears that never reached my eyes. I trust and hope that I was mad; I do most truly pray that it has been madness that through all my life has blighted friendship in its perfect bloom—that has made me eager and delighted with the first appearance of affection—the mere pleased look of chance acquaintances—but that has taken from me at different periods of my life as ardent intimates as a man could have—that has left me, at this present, a very very few whom I have known a month ago, and shall have lost before the next; and that—I hope at no distant time—will cause my dying eyes to lack a hand to close them.

How I strove to overcome my hideous carelessness! what honeyed words did not I force my stubborn tongue to utter—what miserable and useless disguise did I not wear, in order to deceive the ear and eye of love! 'Leave me, my dearest James,' said my poor sister, 'leave me to the remembrance of what you were; it will sweeten the last few weeks I have to live, which your presence can but, alas! imbitter; and when I see you again, may it be in that blessed abode, wherein indifference can never enter, and pure eternal love hath no satiety.'

She took all blame upon herself and the caprice of her disease, affected to be pleased to be away from me, and uneasy at my approach. My dear mother and the rest never knew the sad truth, but implored of me with tears to be of good heart, and to bear patiently with this strange treatment. I do not doubt at all that Ellen's death was hastened by my fiendish and inhuman conduct. When I leant over her grave in Shardale church-yard, night after night, as I have done, it was not love that led my restless feet—although I cherished every thought of her, as the nun clasps her crucifix to her heart, as soon as they became but *memories*—but rather the morbid feeling that brings the murderer to revisit the scene of his crime; and the winds about the yew-tree seemed to murmur at my presence, and the stream that circles round the holy spot to grow angry as my shadow fell athwart it; and the very grass upon that hillock to make haste to rise, to efface the impress of my penitent knees.

Three years from this, my father's bones were laid in the same place; and truly it was strange how anxious he had been upon this point—that his final resting-place should not be within hearing of the hurrying street, to add another unit to that sum of human corruption that at noonday festers in our towns. He left but little money—far less than had been expected—an income of £500 to my mother, and £200 a year apiece to each of his sons. She, with the utmost liberality, gave us an allowance of £100 per annum besides, during our stay at the university—whither, to Trinity College, Cambridge, we went the next October.

I always used to fancy Charles was her pet-boy, although she loved me very dearly, and proved it in a thousand ways; and that supposition of itself was quite sufficient to prevent the excess of affection on my own part which was always sure to end in cold indifference. My brother and myself were friendly, and never, to my recollection, had a single quarrel; but our tastes were quite dissimilar, and our lives at college diverged so greatly, that we never passed a day in either's company. He attached himself to a steady reading set; ate jam at breakfast; walked on the Trumpington Road; dined in hall without pudding; kept chapels regularly; was made a scholar in his second year; became king of a coterie; and puffed up with

mathematical acquirement; and finally, caught a very high wranglership, from which his constitution was not strong enough to rally; and he is now a Don. I, on the contrary, knew everybody from the 'Sims' (disciples of Simeon) to the 'Fighting-men'; was treasurer of the C.U.B.C.; a committee-man on 'the Drag'; president of 'the Union'; a member of 'the Apostles'; scraped through my 'little go'; crammed for the ordinary degree; and left college the most popular man of my time. I was principally indebted for all this to my intense desire to please, and high pressure of animal spirits; but I had great vivacity, and a warm and winning address. In whatsoever society I was thrown, I became one of them at once, because I could not help it, and not by any effort or compulsion. I had a better chance of being considered a wit than most men, inasmuch as I restricted myself to no subject whatever. In my mouth, blasphemy lost its sinfulness; coarseness, its vulgarity; and the sneer from my ever-smiling lips, its bitterness; above all, I never said an ill-natured thing of any man, and always spoke affectionately of my acquaintances behind their backs. It was through these qualities that I became 'a great brick,' and 'the best-hearted fellow breathing.'

I never cut a man at all, so never made an active foe, but 'dropped' my nearest and my dearest friends in periods varying from one month to a year. I had therefore three sets of men, in my three university years, who had been in their seasons my intimates; who had confided to me their 'young men's secrets,' their likes and dislikes, even their religion, or the want of it.

Their intercourse with me ran in this fashion: First, I was much enchanted with them; second, devotedly fond of them; third, on the most friendly terms with them; fourth, rather indifferent about them; fifth, exceedingly bored by them; sixth, vexed to death by their approach—but always civil to them, and always smiling. I could no more help the change of feeling than account for it, but I was sensible of its injustice, and did what in me lay to make amends for it; with what success, let him who has attempted to affect affection, at any time, declare.

Even at college, however—the very place for such a man as I to gather friends—this fickleness had nearly ruined me. Clement, a fellow-commoner, friend of my early days, was amongst my oldest acquaintances; an honest, hearty youth—rare qualities amongst the grade to which he belonged—whom I both dearly liked and respected. I felt the demon rising within me, but resisted him so stoutly, that he had to call the fiend of jealousy to aid his evil work. I was much too confident in my own powers to dread this last in general, but whenever I have felt a sting of his, ever so slightly, both jealousy and love have taken flight together. I could not bear a rival, even where rivalry on my own part must of necessity have been out of the question. If I had met a stranger in a railway-carriage, whom I 'took to,' as the phrase goes, and he had mentioned that his father or his brother was the dearest, or the most agreeable, or the wisest man he had ever seen, I am sure I should have felt annoyed. If comparisons are odious, superlative expressions are at least one degree more so: 'best,' 'handsomest,' 'cleverest chap I ever knew in my life,' are adjectives better diluted if applied to others than the persons we address. It was at my rooms that Clement had first met Lacy: I had introduced them to each other as kindred spirits, and imagined that I was still their principal bond of union; but I was soon undeceived. One evening, at supper-time, a letter was brought to the former by a special messenger, and he left the table instantly without a word. I could not well leave my guests, and I thought, besides, if there was any bad news from home, it would be better he should be by himself; but early next morning—at least early for me—I called at his rooms to see after him. I found him deadly pale, with Lacy, who had

sat up with him all night, beside him. 'Ah,' said he gaily, 'I shan't have many friends now; my dear Branksome, besides you and Francis.' He never had called me James. 'I am almost ruined, and must change those "spangles," that you used to laugh so much about, for the pensioner's gown.' Almost all his property, indeed, had gone in some great 'smash' in the City, and he was obliged to descend from the high table and fellow-commoner's privileges. I congratulated him merrily upon 'assuming the purple' of my own rank, and did what I could to comfort him; but the presence of Lacy put triple steel about my heart.

Poverty, sickness, reverses of any kind, I have the greatest pity for and sympathy with. I would infinitely rather insult a great man than a beggar; the last baseness that I would willingly commit, would be the desertion of a friend deprived of fortune or position. Nobody can tell how hardily; how painfully, I strove to shew that my regard for Clement was quite undiminished; how I thought by night and day upon what might be done for him, and used what influences I had to get him an appointment he wished for. But even as I write, my words grow cold and feeble; my heart could not go with him; and first affection, and then interest itself, began to flag and tire. His sensitiveness soon perceived this, and a letter, couched in the haughtiest language, forbade me from his rooms for ever. Then, indeed, it began to be whispered that Branksome cut his friends as soon as they ceased to be useful to him—was a hanger-on of the wealthy—a toad-eater—and everything else that was most abhorrent to my disposition. Only by the greatest efforts at pleasing, and by the most distorted accounts of our estrangement, could I reconcile myself to our common acquaintances. Still, as I said, I left college, popular; though, it is true, that popularity had been purchased by other means besides smiles and witticisms. I owed some heavy bills at Cambridge, and had borrowed a considerable sum of money: my mother, even if I had not been ashamed to ask her, was unable to assist me; my pride revolted against applying myself to any of my richer friends; and I spent my first graduate year at Shardale with a mind tormented by suspense and fear, haunted by the demon Debt, and unable to be soothed, as it was wont, by the contemplation and communion of nature.

At Wellingfirth, the nearest town to our lone valley, we had a large acquaintance. I myself, from a certain softness of manner and gentleness of nature, have always been welcome to female society; and in return, have preferred it to that of my own sex. Two ladies of this place were especially my favourites and confidantes: one exceedingly good-looking; both young; and possessed of a sufficient independence. To do myself justice, this last matter never entered into my thoughts at all. I liked the wit, the nobleness of mind, the bold originality of the one, and the beauty and accomplishments of the other. We read together such plays as suited us, sang glees, and accompanied each other in music. People talked, as people will talk to the end of time—were sarcastic upon 'Platonic attachments,' sympathies of thought, and such like—in short, the common-place objections vulgar natures make to companionships they do not understand, were made. But Ellen was much too sensible to care for them, thinking as much of matrimony, indeed, as I of mathematics; and Lucy, not being talked about, but admitted into our society, as was said, only to 'do propriety,' fell in love, poor girl, with me.

I wonder why difference of sex should be conceived to be an insurmountable bar to the purest and most elevating friendships? I wonder why sympathy of thought and similarity of disposition should not exist between two people without the passion of love? I wonder whether those who decry such things, have any knowledge of love themselves at all, or whether they

are not perhaps altogether of the earth, earthy? I preferred Ellen Newby to Lucy Ward; but I had not the faintest wish to marry either of them; nor was I the victim of the Newgate hero's mishap, who would have been so happy with either were t'other away. Had bigamy been permitted, I should have had quite as little desire to take advantage of that. Why should I have wished to make other use of those pleasant lips that so charmingly warbled my pet-songs?—to press those fingers so well employed at the piano? It appears to me, indeed, once for all, that while a flirtation is but one degree above a Casino conversation, the intercourse I have been describing is of the least worldly, the least vicious, and the least false. I spoke to Ellen quite unreservedly on every point, with exception of my pecuniary embarrassments and habitual fickleness, and she was equally communicative to me. I say again, upon my soul, that whatever of good is yet left within me, whatever sorrow for sin, whatever endeavour after the right, I am indebted for, my dear, dear girl, after Heaven, to you. Oh, if you should set your eyes on these sad revelations, I know you will not ascribe them to unworthy motives. I know that if I came to you this day—as come I might, for but two streets divide us—and offered myself again to be your friend, you would not trust me, though I took Heaven to witness. I know too well how you would disbelieve, even if you did take me to your heart again, the possibility of reviving that dead joy—how infinitely worthier you hold a noble memory, than the re-enactment of a past pleasure. Were not these words your own once?—

Disinter no dead regret,  
Bring no past to life again;  
Those red cheeks with who are white,  
Those ripe lips are pale with pain.  
Vex not thou the buried bliss,  
Changed to more divine regret:  
Sweet thoughts come from where it lies  
Underneath the violet.

One morning, that I had intended to have spent with her in a congenial task of translation, I received a very alarming letter—no less than a threat of arrest for a sum of £400—incurred in borrowing £250—in case of its not being paid within a certain early date. That date, through some mistake of the postman's, was already past, so that the writ might already be upon its way. If I was in a frame of mind for translating anything that day, it would have been, from choice, a certain poem of Dante's called the *Inferno*. I took my way to Wellingfirth, sorrowful indeed; I told a hundred specious fibs to explain away my depression to Ellen; but I might as well have tried to hoodwink Argus. 'You owe money, and can't pay it, James,' at last she said; 'and you are proud about asking me to help you, as though I were one of those who change heart and tone at once upon that subject; and our friendship is but like that of those we have so often laughed at, after all—eh? Now, don't you see me frowning, and hear me speaking slower, like Mr Cheeks the banker, when one wants to overdraw.' And so, with a tumult of words to prevent my thanking her, which indeed I did not know how to do, she put into my hands a blank-order, and bade me fill it up as I pleased. I wrote an IOU for £400 in return, which she instantly made a 'spill' of, and set a light to; and I promised to pay her interest quarterly, which she playfully assented to, and we had a delightful lesson.

I had never taken money from another in this way before; I was not arrived at the wisdom of a celebrated poet-philosopher, who 'knew on which side the obligation lay;' but I certainly trod homeward with a lighter step with the cheque in my pocket, and the load upon my heart replaced by an easy burden of tender gratitude: even then it gave me no slight shudder to

see Solomon Levi, the atrocious money-lender—like the devil for a lost soul at almost the minute of forfeit—at the very portal of the cottage, with two other ginger-faced gentry, his companions, come to do me honour. What a hideous shadow he cast upon the rose-trellis, set up by my dead sister's hands! His Jewish nose was thrown there in all its prominence. I could not help thinking what miseries this creature would have had power to bring upon the innocent as well as the guilty, had it not been for Ellen's generosity. Between her and him, what a monstrous gulf—both human creatures, but God's child and the Fiend's! Thank Heaven, neither Charles nor my mother caught a sight of him; I sent him back appeased, and even jocular.

For weeks and weeks after this business, I was filled with increased affection for my companion; my regard for her, indeed, as my benefactress, never diminished; but when I at last found myself expressing so much continually to her own ears, and to her manifest distress and pain—when I began to be solicitous and unhappy in myself about the means of repaying her—I did not need her reproachful looks, and faded, rayless manner to inform me, that the curse was fallen, and the dream of my delight dissolved.

One day, that I had resolved inly should be my last visit, I found Lucy Ward with Ellen in the garden. I came in at the lattice-gate, as was my custom, and through the ivy-walk that shut me from their sight till close upon them. I could not have helped hearing their conversation had I had the courage to forego it. Ellen was speaking—I knew it by the tone at once, without the words—of myself; the words, as I know now, of honest warning from a noble woman to a weak one of her own sex—bitterer a thousand times to her that uttered them, than to the living heart that heard.

'I did not say false, Lucy, nor deceptive, but fickle—fickle as the winds themselves. I do not know whether he loves you; but indeed—indeed, dear girl, I fear that he does not. I know right well that if he does, it will not be for long. He never told me of this fault of his—this natural and inborn disease; but I found it out long since in the case of others, and prayed—ah, how I prayed!—that he might not so act towards me. Alas! he looks upon this house as a truant on his school-room. I tell you, the sole feeling that brings him here at all is, that lowest of all incentives—the sense of obligation. He comes to-day, and you yourself shall judge of his constancy.'

'And so you shall, Lucy,' said I, confronting them. 'As you have thought fit to disclose that circumstance, Miss Newby, on which you enjoined my secrecy so strictly, I may confess at once that I do owe you four hundred pounds, with the interest accruing thereto, for two months and five days. Although you burned my bond, it seems you are anxious to have, at least, a witness; and stung to madness by what I had overheard, I was still continuing this cruel strain, when Ellen on a sudden grew deadly pale, fainted, and would have fallen, but for Lucy's arm, to the ground. I carried her into the drawing-room, the glass-doors of which opened out upon the lawn, and as soon as she shewed signs of returning animation, imprinted a kiss on Lucy's beautiful forehead, and left the cottage, never to enter it again.'

From that hour, I set my whole heart upon marrying Lucy Ward; not that it was set of itself, not that I affected even any ardent enthusiasm upon the matter, but knowing for certain, and by her own confession, that she loved me, I did my best to reciprocate the sentiment. Moreover, from the fact of my feeling so calmly upon the subject, I drew favourable auguries that the esteem, which I truly had for her, would last. How but by this marriage, indeed, was I to pay off my debt to Ellen—an obligation that by this time had become well-nigh intolerable? This last reason, I fear, weighed as heavily as any.

My mother and friends were much pleased; they had greatly preferred Lucy, of my two favourites, all along: the knowledge of their own inferiority—insufferable to women, if felt in regard to one of their own sex—had opposed them to Ellen from the first.

I was proud of my young wife, and almost entirely happy on the day I was married. With her assistance, I had paid all my debts, and above all, Miss Newby's. I felt thankful to Lucy, and kindly, 'and her beauty made me glad.' People expressed their satisfaction at seeing so wild and reckless a young gentleman safely landed. There was great rejoicing in all Shardale valley; the little bell pealed as joyously as it could—the same that had tolled for my sister's funeral—the young girls strewed with flowers our path that led beside her grave.

For a whole week, I loved my wife exceedingly; I began to have some hopes of living happily with her to the end; I even wrote verses about her—which is indeed a rare proceeding in a husband—for I was an author and a poet. It was to prosecute my literary labours more advantageously that we lived in London. Our fortune, though small, was yet sufficient to shield us from much of the early bitterness of that kind of life. I was young and sanguine, and found that there was a battle uphill and against odds to be fought, such as I had never dreamed of. I experienced all ills that authors are heir to—rejections, delays, misprints, alterations, and publications without pay from the serials, unfavourable reviews, no reviews, and little or no sale of original works. One day, my wife observed upon one of these casualties: 'Lucky for you, my dear James, you have not to get your bread by your wits.' It was a coarse, thoughtless remark, and as soon as it was uttered, she strove to erase the effect of it by caresses; but I never forgave her from that hour. To think that in what interested me most on earth, I should meet from my life-companion not sympathy, but sneers; that she should have—as it seemed to my morbid mind—the baseness thus to hint at her superiority of fortune. I never looked upon her beautiful face without these thoughts; and it became a burden to me to have her eyes to rest on me. I fled her presence day and night. The more her nature shewed itself repentant and loving towards me, the colder grew my feelings towards her; from indifference to antipathy, from antipathy to downright hatred; and then my hideous characteristic had attained its worst. Anything like cruelty, insult, or even rudeness, I never committed, or had any desire to commit: I was shewn to be a monster only by the negative proof. Wandering aimless over London, eating solitary dinners at chop-houses, unable to apply myself to any action, unstrung and jaded, and dreading always to return to my unhappy home, I passed those weary days. I wondered, as I watched the lonely well-dressed men that saunter all the noon about the streets, or those of an inferior grade that hang in knots at corners of the mighty thoroughfares, but clustered there only for a few hours, and clearly not habitual companions, whether there could be one so desolate as I—I, that had wife and mother, and acquaintances in crowds; and whether there was one who, looking in my heart, would come to change his lot with mine, who had a house, at least, to cover me, and food and even money at command.

But I had not money enough, nor nearly so; I wanted pleasure, excitement, the fever and delirium of life, to waken me from my gloomy torpor, and I was still not selfish enough to purchase that at the price of another's ruin. Our income was just enough; the little beyond it I had once been able to procure by my pen, I could procure no longer: that 'Lucky you have not to get your bread by your wits, James,' paralysed my brain.

It was about six months after marriage that the event occurred which withdrew me from my former

existence, and placed me in my present life. I was gazing in at the great printshop beyond the Haymarket Theatre, one afternoon, looking earnestly at the mouldings of the frames, at the names of the engravers, at the titles of the dedicatees—at anything, in short, that would not interrupt my course of meditation—when I became suddenly aware that I was being watched: in the dark shadow of a print before me, I caught the reflex of a pair of eyes that seemed to read right through me. I turned round slowly, and recognised at once one whose name, and wealth, and writings were at that time the talk of half the civilised world—a little sawn old man, dressed in an attire of nearly 'sixty years since;' his tall, narrow-brimmed hat, his drab breeches, his bright Hessian boots, at once declared to me that mysterious being, hard, dry, and cynical, who had exhausted life at an age when most men were commencing it, and was looking, according to his own confession, for death—as, it might be, for a novel sensation; at one time the richest, at all times the most accomplished man in Europe, whose experience had been equal to that of the Preacher's of old: 'Whatsoever his eyes had desired he had kept not from them; who had withheld not his heart from any joy.' And the like result had happened to him also, for he 'had looked on the labour that he had laboured to do: and, behold, all was vanity and vexation of spirit, and there was no profit under the sun.'

'Young man,' said he, fixing those merciless gray eyes upon my face, 'you were thinking whether death itself were not to be preferred to the life you live. You have no friends—no, not one; you are poor—dependent, perhaps, upon another; you would change lots with nine men out of ten that are passing by at this moment.'

'My lord,' said I, 'I would change lots with any one of them.' The face of the old man lit up with interest at these words.

'You know me, then, and therefore know that I can do whatever takes my will. Now, would you give up parents, children, wife, and name, and even country; would you be content to begin the wide world afresh—I say, would you become *another man*, for gold enough and lands and houses in exchange?' I knew this man could do whatever thing he would; my heart beat high with hope of escaping from my bonds.

Firmly, and quite collectedly, I said: 'I would do this.'

'Remember, boy, this lies at your own door, then,' said Lord Fordyce. 'A whole week yet shall elapse before you cross a gulf that cannot be passed over from the other side. At this spot, and at this time, we meet again in seven days. Take thoughtful heed to what you then shall do.'

### SMITH, YOU KNOW!

In the passages of life, if there be a theme truly grateful to the heart and absorbing to the mind, which sovereignly interests, nay, takes the whole soul captive; if there be any one topic calculated to awaken to a sense of the positive, and snatch us from the misty regions of romance, which, compelling us from the contemplation of the vague, the visionary, the ideal, forces us face to face, heart to heart, with the things of earth, and hurries us into the very council-chamber and stately presence of the real; if there be a subject omnipotent in expression, powerful in mystic meaning, wide-spread in its influences, unchangeable in its essence, and marvellous in its destiny, assuredly that theme, that subject, that all-absorbing topic, is comprised in that wondrous impersonation—*Smith!* Not Smith in the abstract; not a Smith of dreams or poetic reveries; not Smith disembodied, fantastic, unsubstantial; but Smith as you and I know him—animated, vigorous, robust; Smith in the actual presence; pure

flash-and-blood Smith. The happiness, the fortunes, enterprises, joys, sorrows, triumphs; in a word, all that concerns the earthly lot of that time-honoured and respectable individual, are of great moment to the whole community. What heart does not throb with delicate sentiments; whose pulse does not beat with pleasurable emotion; what cheek is not suffused with joy; whose blood does not run more genially; whose spirit is not moved to the very depths, whenever the mystic monosyllable is pronounced! Does it not open up vistas of cordial remembrances and neighbourly associations, of merry meetings and hours of goodly enjoyment? And who does not feel, and think, and sympathise with Smith, were it only for the general memories he awakens; who does not sympathise even from a higher and nobler motive? For to every class and in every rank he is a familiar, a *salutateur* (not a demon): from the topmost round of the social ladder even down to the lowest, he has friends, relatives, and acquaintances. Now, wishing as we do to be on the best possible terms with all the world, is it not natural that we should try to be hand-in-glove with Smith—*qui est le frère de tout le monde*? Half of us have seen him, spoken to him, shaken hands with him; how the other half manage to get on without knowing him, we can hardly conjecture. All who do not know him, ought to lose no time in seeking his acquaintance, for no one, we will venture to assert, has a larger connection, or does a more considerable amount of business in social relations. He seems to hold an equal partnership with most people, only monopolising their esteem, and everything else worth having; he is a miscellaneous dealer, who has a running-account with everybody, a stockbroker paramount on 'Change, an Indian merchant, a banker; in fact, wherever an honest penny is to be turned, depend upon it, there you will find Smith. In fine, there is nothing he has not been: he has had a trial of every profession, and has illustrated them all; has put his hands to every trade, and mastered them all; has turned the tide of commerce into fresh channels; and a good thing he has made of these transactions, if we may infer anything from the good understanding that exists between him and the world at large.

If ever there was a pet of the public, Smith certainly is the prime and principal: his praise is in every one's mouth, his fame ubiquitous, his virtues genealogical. Wherever or by whomsoever the mellifluous patronymic is uttered, whether at Almack's or at the *dear* Philharmonic, whether in the Cider Cellar or classic Cremorne, quip and crank are at once evoked, pleasant memories are awakened: it provokes a familiar nod or knowing wink, a kindly smile wreaths the lips, and a whole alphabet of faces greets your vision. Smith is a household word, and very useful as a moral utensil. When anything goes wrong in your domestic concerns, lay the blame on Smith, and you are sure to get off scot-free. When you would indulge in mirth, and display your innocent powers of fun, Smith is a safety-valve for much wit, which, though small, is not the less pleasant. How many simple stories, pointless anecdotes, and puny puns, pass current, merely because inscribed with the revered legend—Smith. He is a familiar guest at board and hearth; the very sound of his coming is cheering and jubilant like a well-toned chime, for it awakens many a merry peal. As Mrs Pardiggle said of her basket-chair: 'Truly, Smith is a great institution.' Take away his name, and you absorb his individuality; substitute Jones, for instance, the powers of Smith, for good or for—let us charitably suppose a parenthesis—are at once circumscribed; he topples down from the airy height where our imagination had placed him; he becomes a man even as the rest of men—a complex tissue of accidents. A Jones!—as well might you have persuaded Samsón to wear a wig when he had his hair cut. On this euphonious patronymic, wondrous and

protean changes have been rung; but experience proves that they alter not the native simplicity, and take naught from its sovereign excellence; neither can its sweet resonance be checked. Should an ambitious godfather, when conferring the conventional spoon on some incipient Smith, infatuatedly express a wish to bestow his own name and surname on the young hero, would not this sound like profanation? What, for instance, has Julius Cæsar Muggins in common with Smith? What has he to do with Smith, or Smith with him, that they should be thus hustled together during the wide space of a lifetime? Would not this be gilding refined gold, adding a perfume to the violet? Such harsh combinations could not, however, suspend the flowing cadence, mar the wondrous harmony, or break the final close. Smith, with its native dignity, would redeem a whole Rubicon of Julius Cæsar Mugginses.

Young S., of Tower Hill, who is the exact counterpart of his governor, even to the tortoise-shell spectacles and wooden leg—some folks even say he was born with both, and look upon them as family features—has interfered with his respectable patronymic, as though it were redolent of cheese; with desecrating hand, he has put out an *i*, and substituted a *y*, though why he assumes *y* to the detriment of his *i*, no mortal can tell. Of course the public, who hold his venerable parent in high honour, will not be thimble-rigged; the trick will not take. Young S. perseveres, notwithstanding; discretion and he are sworn enemies; he is rich in pelf, and anxious to sink the shop; he would fain hobnob with his betters; he is '*ivre de gentilhommérie*,' of a decidedly aristocratic turn, but considers his patronymic a stumbling-block, an eternal blister, an everyday misfortune; forthwith he cultivates his nascent moustache, and the tail of his name, into which he inserts his *j*, unmindful of that bird in fable which was stripped of strange ornaments, and shamefully plucked. O rash mortal! disguise thyself as thou wilt, thou art a Smith still—pure, simple, undefiled, the true worshipper will ever feel thy presence; thou art still recognisable; assume any mask thou wilt, or even veil thy time-honoured features, yet thou art a Smith. Smyth, Smytjhe, Smithett, Smithies, Smithsonc, Smythers, Smithurst, Smythwaite, Szlinxmydijhskikoff, Honble. Montgomery - Byron - Dudley - Fitz-Smytjhoille, Herr von Kazenellenbogen Schmidt, El Señor Conde Don Carlos de Smittio; these, and a thousand others, still are modifications, free-and-easy combinations of the prime original: its powers of adaptation to all requirements and fancies, surpass comprehension. Smith is a fact which contradicts the nature and fortunes of fact in general; it bends to every exigency, sways and swerves with every wind of fashion, submits to the caprice or whim of the individual, and yet is able to abstract itself from its surroundings, from the mere accidents of time and place; it rides triumphant through the shock of opinions and the storms of change, comes forth unscathed from the fiery furnace, and can resume at will its primal condition, and resolve itself into its first essence; it is unextinguishable, inalienable. It need not fear the fate of many a brother fact, which, after having served a hard apprenticeship in this work-a-day world—after having been jostled, and brow-beaten, and belaboured, and been everybody's servant, is shamefully neglected, trampled on, despised, hurried out of sight and remembrance into the lumber-rooms of the Past. No! a thousand times no! Brown, after an eventful life, may disappear from the busy throng of men, from the whirling wheel of toil; his name may no longer drop lovingly from their lips, his voice be no more heard in their councils: Jones may become the memory of his former self, an enigma to future Rawlinsons and Layards, a hieroglyph, an unresolved problem, a puzzle, a mute mystery to antiquaries yet unborn: Robinson may be whirled away into the

current of things that were, may lapse into a myth, a fable, a heathen deity; an object for a museum of antiquities; one and all may vanish from the world's history; but Smith is an evergreen, a perennial, a flower always in bloom, replete with beauty and vigour, ever new, a true '*immortelle*,' which decay can never touch; the delight of every eye, the charm of every heart, a hymn of welcome, a magic spell, a talisman, a theme for poets, historians, philosophers, in itself a sublime epic. Who shall unsmooth Smith?

We pause for a reply.

## PEOPLES AND PROSPECTS OF EASTERN EUROPE.

### FIRST ARTICLE.

THE relations of Russia and Turkey, which have led to the present crisis of affairs, are perhaps among the most singular in the history of nations. A complete account of them, uninfluenced by national feelings or contemporary passions, is much wanted. But this is scarcely the time to undertake it. We propose to touch only on a few points, which it will be interesting to consider in the intervals that must occur between the various instalments of important intelligence so anxiously waited for in this country, whose material prosperity and moral influence must be greatly affected for good or for evil in the struggle at present going on.

The Turkish Empire, as it now exists, contains the cradle, not only of its own religion, but of that of Russia, by whom it is menaced, and of Western Europe, by whom it is defended. Mohammedanism, according to the doctrines of which the Ottoman constitution is framed, claims, indeed, to be the direct heir of the traditions which form the basis of the faith of its enemies and its friends; so that, historically speaking, we are now witnessing what may perhaps prove the final contest between races which have been moulded into different forms by ideas more or less legitimately derived from ancient Judea. It is a strange thing to notice how slowly, and yet how certainly, principles and opinions that have a common origin, developing in different ways, under different conditions, apart one from the other, do ultimately, according to some mysterious law, come into collision to contend for the mastery—not always in a direct or patent manner, but generally disguised in a political garb—seemingly for the purpose of satisfying the ambition of princes, or the instinct of national aggrandisement. If we stand aside from the discussions of the day, we cannot but perceive that the fulcrum on which statesmen who do not seem in all cases to share the convictions of which they make use, are now leaning their levers in the East, are almost exclusively religious passions; and, indeed, in both East and West, among Protestants and Catholics, as well as among Greeks and Turks, far greater reference has been made of late to spiritual matters as grounds of action, than has been noticed for more than a century. It is this circumstance, more than the strength and determination of the parties who have taken the field, that gives a momentous character to the war; because, when political objects alone are sought, it may be foreseen that mutual exhaustion may lead to compromise; while, when people arm themselves for conscience' sake, it is impossible to calculate of what amount of sacrifice they may be capable—what direction their energies may take—how far, when once roused, they may be stable in alliances, contracted at first for mere convenience—or what amount of success or disaster may induce them to revert to a state of repose.

At present, the war, so far as its external appearance goes, is not chiefly a religious war. Its leaders have definite and comprehensible motives of action of a political nature; and one at least of the allied powers is completely governed by considerations of prudence

and expediency. But every day tends to bring out more clearly the fact, that the Turks and all their Moslem fellow-subjects consider that they are fighting, not for this fortress or that province, not in defence of frontiers or treaties, but for their very existence as disciples of the Koran. The Turks have long been afflicted with belief in a prophecy which assigns the termination of their political supremacy to about the present period; but all their brethren have, besides, recently, by contemplation of the wonderful progress of the Franks, been awed into the belief that the faithful may possibly be uprooted from the land, and that infidelity is destined to achieve a decisive temporal triumph. This idea has not been articulated by many, but it is evidently busily at work in the innermost recesses of Mohammedan thought; and partly explains the supineness and indifference which have been displayed by certain important classes in the Turkish Empire. Newspapers do not seem inclined to admit this truth. At least, we have been entertained throughout the winter by narratives of patriotic enthusiasm which would have done no dishonour to ancient Rome. That enthusiasm does exist in some classes and individuals, and forms the justification of our interference as allies; but the notion that it is general is dangerous, and might prove fatal. No good man of business would like to carry on his operations without a perfect knowledge of the means and disposition of his partner. No nation should sign treaties with a people with whose temper and character it is unacquainted. Let us remember then, that however judicious our conduct has been in a diplomatic and political point of view, we have the misfortune to be engaged in a struggle in behalf of a people which neither believes in itself nor in its allies; and which can be revived only by a new development of bigotry and superstition, that would render it perfectly abhorrent to us, and would indeed entirely preclude the possibility of action in concert. The most cheerful prospect is that according to which we shall be able to defend Turkey without any great call on its national enthusiasm. As we have already seen in various instances, the impulse of the fanatical party is to attack friends as well as foes, to suspect all foreign aid; and, as extremes meet, it is quite possible that those who now, with various appeals to the beard of the Prophet, urge the wildest measures of resistance, may be the first to be disgusted, and clamour for peace.

The chief danger of Turkey is the heterogeneous nature of its subject populations, and the identity of their religion with that of a powerful neighbour and traditional enemy. Were it not for this latter circumstance, government would be easy. Our Indian experience tells us, that a very small dominant class may keep almost countless millions in subjection, provided that the frontier be surrounded by weak and anarchical principalities; whilst the rise even of a comparatively small organised state, like that founded in the Punjab by Runjit Singh, is dangerous. Russia, irrespective of the personal ambition and traditional policy of its sovereigns, has as many motives as opportunities for interfering in the political affairs of Turkey. It received its religion from priests of the only race that possesses much intellectual capacity among the subjects of that empire. Russia was converted to Christianity by Greek missionaries, long before it was capable of harbouring the projects of aggrandisement it has since entertained. A constant communication has been kept up by this means between the two empires. For many centuries, knowledge and faith went from the south to the north. But as the Greeks became more and more degraded under Ottoman rule, and as the political organisation of Russia became more perfect, the tables were turned. For the last century, every movement that has taken place in the Greek or Hellenised population of Turkey, has had its origin at St Petersburg; by various means, the czars have contrived to assume,

as it were, a papal character; they are looked up to with respect and hope by all the ignorant subject populations throughout the Ottoman Empire; and it must be admitted that the Greek revolution, which assumed the forms of a patriotic struggle, and led to some good results, was at bottom little else than a diversion in favour of Russia. This is the reason that, whilst poets, students, and the public generally were enthusiastic in its favour until it fell short of its brilliant promises, statesmen always exhibited a hostile feeling towards it. This hostility is experienced by them in a still greater degree at the present day. Not without reason they believe that a nation which can only struggle for its freedom at times when the freedom of Europe is menaced by its only ally, and is compelled to appeal to the sacred principles of liberty in order to further the designs of despotism, occupies an anomalous position, and can claim but comparatively cold sympathies.

We must not, however, keep out of mind the fact, that, if Russia is enabled to exert a disturbing influence in the Ottoman Empire, it is not merely on account of her community in religion with the subject inhabitants of the nearest provinces: this community furnishes her with the machinery of action; but the secret of her power lies in the discontent created in the Rayahs by the stupid misgovernment of the Turks. Here, however, we must guard against exaggeration. Many persons seem to believe that Turkish tyranny has now reached its climax, and that if the Greeks have revolted, it is against unbearable oppression. This is a mistake. The Turks of the present day are, in a great measure, bearing the penalty of the sins of their forefathers. Their rule is anything but just and mild, it is true; but a considerable improvement has taken place. The proof of this is the increase of prosperity, on which the Christian populations, by their advocates, base their claim to independence. It is undeniable that the Turkish yoke is lighter than of yore; but history tells us that it is not in human nature to be grateful for a diminution of oppression. Many of the abuses which caused the great French Revolution had been removed before it burst forth. In the case of the Christians of Turkey, they have suffered so long, that their minds have been moulded into a hostile shape. The name of Turk is so abhorrent to them, that if a King Alfred were to obtain the sultanship, and govern with perfect justice, they would seize every opportunity to overthrow him.

These remarks will suggest that the difficulties of the Eastern question are much greater than the majority of the public is disposed to believe. In spite of all that has been written and published, very vague notions seem to be entertained in England of the state and prospects of the various races that inhabit the Ottoman Empire, as well as of the nature and forms of the Russian claim of protection over them. We shall endeavour to embody some of the principal facts connected with this intricate question, in order to assist our readers in better comprehending the events which are at present taking place. Everything tends to shew that the affairs of Europe have reached an important crisis, and that a question to which imperfect reference has been so often made of late—that of the revival of nationalities—is about to force itself on our attention.

By its geographical position, and the character of its government and its people, Russia must always exert great influence on the fortunes of Eastern Europe, and, consequently, on those of civilisation. The emperor, though nominally restrained in his actions by certain institutions very difficult to be defined, is perhaps invested with more nearly arbitrary power than any other prince or potentate in the world. We cannot, however, easily realise to ourselves his exact position, and are apt sometimes to fancy him wielding his authority as capriciously as a man might wield a weapon of offence,

ambition, or zeal. But this it would be impossible for him to do. He is obliged to work by means of an established machinery, consisting of individuals brought up according to certain rules, and capable, therefore, only of acting in a definite way. Peter the Great, as he is called, achieved with immense difficulty the task of creating the present form of Russian administration. It would require a much abler man, now that the empire has increased in bulk, and has grown accustomed, as it were, to perform certain movements, to give a new direction to its energies. The czar is, indeed, almost like the soul in the human body; but he can only make use of the faculties and members that have been given to him.

This is the reason why Russia, whatever may have been the personal character of its sovereigns, has steadily pursued what is called its traditional policy. We hear much talk of wanton aggression; but the aggressions that have recently taken place, as well as other aggressions more important, yet which excited less opposition, are to be accounted for on two principles: first, that according to which every powerful state, the constitution of which is not based on pure justice, seeks to absorb the dominions of its neighbours; secondly, the tendency of races of similar origins, or, which produces precisely the same result, of similar religious beliefs, to unite under one head. Both these principles are hostile in their developments to the progress of civilisation. One of the great achievements of the French Revolution was to destroy the old division of the country into provinces animated by bitter rivalries; the great misfortune of Spain is, that a similar work has not been accomplished; and it would be a great disaster for Europe if its map were ever modified so as to unite under the same forms of government all peoples of similar origins or similar creeds.

It is a singular feature in the actual position of Europe, that this appeal to the principle of nationality is made by the advocates of two extreme political doctrines. The Pan Slavonic theory of Russia—identified with the fate of arbitrary government—has its counterpart, though on a smaller scale, in the theories on which are based the parties who recently raised the cry of independence in Hungary and Italy. We must observe in both cases, that, however effectual an appeal to the passions of races may be as a weapon of war, nothing can in the end be more dangerous or demoralising. The success with which it meets in itself evinces a low state of intellectual cultivation. 'Hungary for the Magyars,' and 'Italy for the Italians,' are watchwords not more respectable, however necessary may be their employ, than 'One government for the Slavonians.' They prove the existence of an impulse which may shatter the existing constitution of Europe, but which is not likely to lead to a satisfactory settlement. When men group into families, they descend in the scale of civilisation, the chief mission of which is to efface the distinctions, not only of various classes, but of various races, and to make all pedigree a mere matter of historical curiosity. We observe, therefore, with much anxiety the unmistakable manifestations of the fact, which cabinets seem disposed to make somewhat light of, that, under the aspect of a mere political struggle, in which one party is popularly represented as a ruthless aggressor, whilst the others believe themselves to be acting as the policemen of the world, a signal has been given for the assertion of claims incompatible with the progress of social ameliorations and rational liberty.

Incompatible, at any rate, if the ultimate developments of events always corresponded to the impulse from which they originally proceed. We are far from despairing of the fortunes of civilisation, though we think it necessary to point out the dangers which present themselves. The most imminent of these seems to be, that a population of sixty millions, almost inac-

what comfort it has been accustomed to on prosperous commercial relations, may be grieved by misery, as well as inflamed by religious bigotry, into enabling its government to give to this war the character of a war of invasion. It is quite possible that the North may again send forth, not only organised armies which do damage, and then retire, or are destroyed, but colonies of men allured by promises of rich booty in the south. If the tribe of Tatars which, in the last century, escaped from the heavy yoke of Russia to seek refuge beneath the wall of China, had taken the direction of the Turkish Empire, the destinies of Europe might by this time have been changed. Should the present war be prolonged, such another migration is not impossible. Its effect might overpass the calculations of the Russian court, and of all diplomatists and statesmen. However this may be, we may feel certain that peace will not be restored in the East without some unexpected event of this kind—the rise of a new race to seize on the fragments of the Ottoman Empire, or the formation or appearance of new political entities until now not thought of. It is difficult to believe in either of what may be called the simple developments of the war—the utter checking and humbling of Russia without any modification of its territorial or political state; or the defeat of Western Europe, and the indefinite enlargement of the power of the czar. Great conflicts like this, on the threshold of which we have arrived, generally lead to a catastrophe as surprising as it is dramatic. We do not pretend to prophesy. Our desire is to prepare our readers for some of the events that may happen, by a cursory examination of the condition and antecedents of the various races that inhabit the Ottoman Empire, and those provinces of Russia which are conterminous to it.

To complete our view, however, it will be necessary to state, in as summary a manner as possible, the origin of the actual quarrel; for by so doing we shall be enabled to shew how different are the relations of the Muscovite and Ottoman Empires from those of any two other states in the world, and how absurd it is in our reasonings concerning them to appeal to any of the ordinary rules of politics or diplomacy. Turkey is an amalgamation of various races, all of which are day by day tending to manifest their individuality more and more. Russia is an amalgamation of various races rapidly shaping themselves to one standard. Both processes may be checked; but if they are not, it is impossible to doubt the result.

#### RECENT POETRY.\*

THE poets of the rising generation are going sadly astray. Forsaking the old paths, they have mistaken the porch for Mount Parnassus; and we shall not be surprised if, at no distant day, they give us a new system of metaphysics in blank-verse, or serve up some of the speculative philosophers in rhythmic cadences. In 'our hot youth, when George the Fourth was king,' the aspirant to the laurel-wreath would have thought of some one whose brows it had before adorned. More recently, a Wordsworth or a Tennyson would almost imperceptibly have influenced them; but now we have little else save mist and moonshine. 'Free-will, foreknowledge absolute,' man's relation to the infinite, the mystery of life, and riddles equally formidable, have now to be propounded in lyrics, or solved in semi-dramatic dialogues. Poets are going to the dogs—or, at the very least, their books are going to the pastry-cook and the buttermilk—not to the people

and the heart of ordinary humanity. Subjective, speculative, metaphysical verse-making has become a disease, and it is all the more to be deplored, inasmuch as it has affected those from whom we might have expected something worthy of literature—something likely to save the age from being considered an unpoetical one.

The poetry to which we have been alluding, has recently received a contribution of some importance in a work, or the first part of a work, entitled *Balder*, by a young author, who excited a good deal of attention a few years ago through the publication of a dramatic poem, entitled *The Roman*. Mr Dobell—for such is the real name of the poet, who has hitherto been known only by his *pseudonym* of Sydney Yendys—will never, we think, command anything like popularity even among the ordinary readers of poetry. By those who desiderate that what they read should not only be easily understood, but be obvious and interesting in its design, his rare gifts are never likely to be fully appreciated. *Balder* is destitute of almost everything which would give it a chance of popularity. Its design is obscure; the evolution of that design slow; and the work, as a whole, monotonous.

Unlike most of the strictly subjective poems in our modern literature, however, *Balder* has, we believe, nothing of the autobiographical in its design. The hero is, as we take it, an impersonation of genius without the regulating principle of faith; and the poem, so far as it goes, is designed to illustrate the history of a mind so constituted and conditioned. For any purpose of dramatic interest, it is very incomplete. Strictly speaking, there are only three or four characters; and the history, if such it can be called, proceeds in monologues, rather than in the usual way. The scene is chiefly laid in the study of Balder, or in some other part of 'the tower' which he inhabits, and page after page is filled with the poet's aspirations. Something like an ordinary human interest is occasionally given by the introduction of his wife Amy, and the recital of her sufferings; and one or two of the scenes are enlivened by songs of a light and graceful kind. The continually recurring soliloquies would produce weariness, however, but for the remarkable beauties of sentiment, and the rich and varied imagery which these present. Nor is the story, when we have really got at it, of an inviting character: quite the opposite. It is for the sake of detached passages—beauties which have little or no connection with the story—that *Balder* deserves attention from general readers; and leaving the purpose of the poem to shift for itself, we propose to look for a little at some of these. Morning and evening, noon and night, the spring, the mountains, and the sea—all those aspects of nature, indeed, which the poets from Homer downwards have gloried in, and which the poetasters have hackneyed, receive from Mr Dobell some additional charm, for true genius cannot touch save to beautify. Here, for example, is a picture of Morning, altogether original and exquisitely conceived:—

Lo Morn,

When she stood forth at universal prime,  
The angels shouted, and the dews of joy  
Stood in the eyes of Earth. While here she reigned,  
Adam and Eve were full of orisons,  
And did not sin; and so she won of God  
That ever when she walketh in the world  
It shall be Eden. And around her come  
The happy wots of early Paradise.

Once more to live is to be happy; Life  
With backward streaming hair, and eyes of haste  
That look beyond the hills, doth urge no more  
Her palpitating feet.

\* *Balder*: a Poem. Part I. By the author of *The Roman*.—*The Ballad of Babe Christabel*, with other Lyrical Poems. By Gerald Massey.

poets; how finely her tears and laughter are typified here:

Spring, who did scatter all her wealth last year,  
Had gone to heaven for more; and coming back  
Flower-laden after three full seasons, found  
The Earth, her mother, dead. Far off, appalled  
With the unwonted pallor of her face,  
She flung her garlands down, and caught distract  
The skirts of passing tempests, and through wilds  
Of frozen air fled to her, all uncrowned  
With haste—a bunch of snow-drops in her breast,  
Her charms dishevelled, and her cheeks as white  
As winter with her wo.

Of this quality are almost all Mr Dobell's impersonations of Nature. Let us take one other extract from his panorama of the seasons: it describes the feeling of Summer, rather than the things which awaken that feeling:

Alas! that one  
Should use the days of summer but to live  
And breathe but as the needful element,  
The strange superfluous glory of the air.

The imagery in *Balder* is seldom if ever confused. The flowers are perfect in their kind, but they often bewilder us with their profusion. We look in vain sometimes through the thick trellis-work of many lines for the form of the thing it is meant to adorn, and are forced to content ourselves with the beauty we see. Many of the images, however, are of that kind which will not only bear to be taken from the connection in which they are placed, but give vividness and light to the truth or the sentiment lying beneath them. Here is an example of this:

The uncommanded host  
Of living nations, swaying to and fro  
Like waves of a great sea, that in mid-shock  
Confound each other, white with foam and fear,  
Roar for a leader.

And the following, of a completely different order, is not less perfect nor less original:—

The repose  
Of Beauty—where she lieth bright and still  
As some lone angel, dead-asleep in light  
On the most heavenward top of all this world  
Wing-weary.

It would be vain to extract more of these gems from the pages of *Balder*. The book absolutely teems with them. We know of no modern poem, indeed, in which the imagery is more abundant or more exquisite. Here and there it is elaborated—figure succeeding figure as line follows line; but seldom is there the slightest trace of what a painter would call 'hatching.' The fancy evolves itself with extraordinary fullness, and is always fresh.

But while we are decidedly of opinion that *Balder* contains manifestations of poetic power such as are rarely to be found in modern literature, it cannot, of course, be regarded as a work at all worthy of that power. The very circumstance of its evincing the author to be a writer capable of achieving great things in his art, leads us to regret all the more that he set himself to a purpose which, so far as we can judge of it, is scarcely worth the thought he has already expended. The tendency to the speculative and the metaphysical, which seems to be apparent in recent poetry, is not a healthy one. It is leading to a sacrifice of what is touching and simple for the sake of mystery, and to a disregard of art for the mere effect of isolated brilliancy.

Gerald Massey, the author of a little volume, entitled *The Ballad of Babe Christabel, and other Lyrical Poems*, though not, strictly speaking, of the class to which we have been referring, may be considered as to some

extent connected with it, both through the merits and the defects of what he has written. But for the remarkable promise which this young man's little volume bespeaks, and the circumstance of his being obviously surrounded by dangers which may prevent that promise from ever being fulfilled, we should scarcely have thought of noticing it at any length. The first production of a young poet is, generally speaking, only to be regarded as indicating the tone of the mind from which it has emanated, and the chances of a successful devotion to the gentle art when it has been strengthened and matured. Gerald Massey's first flight 'on the wings of poesy' has not been taken on a wavering wing. Apart, altogether, from the circumstances of his early life and his present position, his book evinces the possession of more than ordinary ability. Considered in connection with his obscure station and his adverse fortunes, we have seldom seen anything better fitted to illustrate the triumph of genius over the pinchings of poverty, and the dangers of an untutored and uneducated youth. From a brief biographical sketch given in the second edition of his book, we learn that Massey spent more than twenty of his twenty-seven years in circumstances little fitted either to awaken or to foster a love of poetry. The prose of life, and that, too, in its hardest and severest forms, was his. The son of a poor out-door labourer, whose scanty earnings scarcely sufficed for the most pressing daily wants of his children, he was sent, when only eight years old, to a silk-mill, where he toiled from dawn till dusk for a shilling or two a week. Education, in the ordinary sense of the term, he never obtained. He learned to read a little at a Penny School; and his mother, who seems to have had tastes somewhat above her station, strove to make the most of what was thus received. She placed the Bible and the *Pilgrim's Progress* in Gerald's way; and when, at the age of fifteen, he was sent to London to earn his bread as a message-boy, he had read little else. He struggled on, however, and the love of reading became something like a passion with him—a feverishness, which drove him to all kinds of schemes and sacrifices in order to get at books. He then began to rhyme; fierce and fiery denunciations of the wealthy and the powerful, whom he considered the oppressors of his class, being doubtless his earliest essays. Something of this kind he has given us in his volume; and we regret that it should ever have been written, or at least that it had not been allowed to remain in the corner of the obscure penny print, to which, in all probability, it was originally contributed.

Self-educated men, especially when their opportunities of cultivation have been so few, and their sphere of intellectual action so narrow as his, are of all others most likely to suffer from a too indulgent estimate of their abilities. To a man of Massey's genius and temperament, unqualified praise is mistaken kindness; and as a good deal of it has been lavished upon him, the result may be a repugnance to receive the lessons which must be learned sometime, and which may be most safely learned now, if his career as a poet is to be at all worthy of the promise he has held out. Hitherto, the love of nature and of everything beautiful has kept his heart right. The harsh and jarring tones of his political lyrics do not seem to have marred the true music of his soul; for while we find in one page inflated absurdities, in close proximity to them there are strains of pure and touching melody.

We have already said that Massey is to some extent connected with that class of writers who do not seem to have aimed at the constructive in poetry, so much as the merely expressive. In some of the best pieces in his volume, the want of a thorough coherence is very manifest. They lack that unity—that wholeness, so to speak, which is as necessary, even more necessary, in fact, to the effect of a lyrical poem than richness of

imagery. The pearls are so often strung at random, that a number of them might be detached without greatly affecting the slender thread on which they are strung. Time and cultivation will lead to the proper application of the poetic power thus, as it were, squandered, but the cultivation must be of the right kind, and it will infer the unlearning of false conceptions as well as the learning of true principles. The tendency of that style of writing which leads to a dependence upon mere felicity of expression, or vividness of imagery, however much these may contribute to the effect of a well-sustained poem, is almost always to a straining after such things, to a confusion of metaphors, and often to what is altogether unintelligible. We could point to instances of this in the little volume before us; but ascribing these to the author's untutored youth, we prefer noticing a few of the fine sentiments which some of the pieces contain. They are often, as we have already said, mere sparkles, but they are lit up with the pure fire of genius. Here is one of them in a single line:—

Ye sometimes lead my feet to walk the angel side of life.

And here is another running through a short passage as felicitous in expression as it is tuneful in its rhythm:—

No star goes down, but climbs in other skies.  
The rose of sunset folds its glory up  
To burst again from out the heart of dawn;  
And love is never lost, though hearts run waste,  
And sorrow makes the chastened heart a deer;  
The deepest dark reveals the starriest hope,  
And faith can trust for heaven behind the veil.

A poem upon Hood, almost every part of which is striking for the clear apprehension of the subject, as well as for the earnestness of the feeling, affords us such beautiful imagery as the following:—

His wit?—a kind smile just to hearten us;  
Rich foam-wreaths on the waves of lavish life,  
That flash'd o'er precious pearls and golden sands.

In sooth, his wit was like Ithuriel's spear;  
But 'twas mere lightning from the cloud of his life,  
Which held at heart most rich and blessed rain  
Of tears.

There is no more cheering promise in the writings of this young poet of the people, than that which springs from his fervent worship of the household gods, the large spaces he has given in his heart and his heart's utterances to the domestic affections. Some of his love-songs, making due allowance for an occasional ruggedness in the versification, are among the sweetest we have seen. They are simple and beautiful, the lack of purpose in them being much less apparent than in his more ambitious efforts. Here is one which has all the characteristics of a true song:—

The lark that nestles nearest earth,  
To heaven's gate highest sings,  
And loving thee, my lordly life  
Doth mount on lark-like wings!  
Thine eyes are starry promises,  
And affluent above  
All measure in its blessings, is  
The largess of thy love.

Merry as laughter, 'mong the hills  
Spring dances at my heart!  
And at my wooing, nature's soul  
Into her face will start.  
The queen-moon in her starry bower  
Looks happier for our love;  
A dewier splendour fills the flower,  
And mellower coos the dove.

And if life comes with cross and care,  
Unknown in years of yore,  
I know thou'lt half the burden bear,  
And I am strong once more.  
And blessings on the storm that gave  
Me haven on thy breast,  
Where life hath climaxed like a wave  
That breaks in perfect rest.

The sentiment in these verses is tender and full of delicacy, while the imagery is almost faultless; the structure of the verse, too, is musical, and admirably adapted to the feeling. Although there is often a voluptuous richness in Massey's imagery, the themes it adorns are pure and elevated. His most beautiful flowers, even those of the warmest hue, are laid on the domestic altar. It is the torch of Hymen rather than that of Cupid which lights up the fire of his love-poems; and hence we find, in the lines addressed to his wife, some of his most glowing and varied imagery. Of her he sings:—

I looked out on the sunny side of life,  
And saw thee summering like a blooming vine  
That reacheth globes of wine in at the lattice  
By the ripe armful with ambrosial smile.  
The flying cares but touched thy life's fair face  
Lightly as skimming shadows dusk the lake.

The sleeping Beauty in my heart's charmed palace  
Woke at Love's kiss. My life was set afish  
As roses redden when the spring moves by,  
And the green buds peer out like eyes to see  
The delicate spirit whose sweet presence stirred them.

One of the most complete, and at the same time most luxuriant, of Massey's poems, is entitled *The Bridal*. Some of its stanzas are slightly obscure, and, as a whole, it has less of spontaneity than his songs; but the elaboration of imagery, the flush of warm life in every verse, is in exquisite consistency with the character of the subject. We can give only a portion of it, and our quotations must be taken almost at random:—

She comes! the blushing Bridal Dawn  
With her Auroral splendours on,  
And green earth never lovelier shone:

She danceth on her golden way  
In dainty dalliance with the May,  
Jubilant o'er the happy day.

High up in air the chestnuts blow,  
The live green apple-tree's flush bough  
Floateth, a cloud of rosy snow!

Cloud-shadow-ships sail faerily  
Over the greenery's sunny sea,  
Whose warm tide ripples down the lea.

Alive with eyes, the village sees  
The Bridal dawning through the trees,  
And housewives swarm 't the sun like bees.

Sumptuous as Iris, when she swims  
With rainbow robe on dainty limbs,  
The bride's rare loveliness o'erbrims.

She wears her maiden modesty  
With tearful grace touched tenderly,  
Yet with a ripe expectancy.

And at her heart Love sits and sings,  
And bodeth warmth, begetting wings  
Shall lift her up to higher things.

The unknown sea moans on her shore  
Of life; she hears the breakers roar;  
But trusting him, she'll fear no more.

The blessing given, the ring is on;  
And at God's altar radiant run  
The currents of two lives in one.

If the extracts we have already given do not suffice to show the promise with which Gerald Massey's little volume abounds, we must plead guilty to a misapprehension of what constitutes poetry of a high order: lacking to a considerable degree the artistic element, it is true, but full of originality and freshness of feeling. It only remains for us to notice the principal poem, *The Ballad of Babe Christabel*, into which, as it seems to us, the poet has poured the whole wealth of his fancy, and in some parts of which he has been more successful than in any of his other productions. Pathos, often of the deepest and tenderest kind, is its chief characteristic; but in the evolution of the story—if we can apply that term to the mere expression of the feelings awakened by the birth and death of a little child—fancy is manifested in great exuberance; nor is there wanting occasional glimpses into the secret springs of sorrow, which evince a still higher quality. The opening verses of the poem are fresh and beautiful:—

When Beauty walks in bravest dress,  
And, fed with April's mellow showers,  
The earth laughs out with sweet May-flowers,  
That flush for very happiness;

And honeyed plots are drownd with bees,  
And larks rain music by the shower,  
While singing, singing hour by hour,  
Song like a spirit sits i' the trees.

When fainting hearts forget their fears,  
And in the poorest life's salt cup  
Some rare wine runs, and Hope builds up  
Her rainbow over Memory's tears.

It fell upon a merry May-morn,  
I' the perfect prime of that sweet time  
When daisies whiten, woodbines climb,  
The dear Babe Christabel was born.

The dirge which the poet sings o'er the dead child is, in our opinion, still finer than the above. The effective change in the rhythm, the strong feeling so exquisitely expressed in some of the lines, and the fine close which is made with the melancholy cadence of the last verse, are all very near approaches to that artistic completeness in which we believe Massey will soon learn to mould his poetry:—

With her white hands clasped she sleepeth; heart is  
hushed, and lips are cold;

Death shrouds up her heaven of beauty, and a weary  
way I go,

Like the sheep without a shepherd on the wintry  
norland wold,

With the face of day shut out by blinding snow.

O'er its widowed nest my heart sits moaning for its  
young that's fled

From this world of wail and weeping, gone to join her  
starry peers;

And my light of life's o'ershadowed where the dear one  
lieth dead,

And I'm crying in the dark with my fears.

All last night-tide she seemed near me, like a lost  
beloved bird,

Beating at the lattice louder than the sobbing wind  
and rain;

And I called across the night with tender name and  
fondling word,

And I yearned out through the darkness, all in vain.

Heart will plead: 'Eyes cannot see her; they are blind  
with tears of pain;'

And it climbeth up and straineth, for dear life, to look  
and hark

While I call her once again; but there cometh no  
refrain,

And it droppeth down, and dieth in the dark.

Most of the extracts we have given afford illustrations of the effect with which the poet can make the

emblems and features of nature and of human life typify the emotions of the heart. The last verse we have quoted is as fine an example of this as any; and it is exquisitely musical.

It is obvious, we think, that if Gerald Massey is disposed to make a full and proper use of his gifts, he has a high vocation open for him. It is one, however, upon which he cannot thoroughly enter without having to contend with and to overcome many difficulties. There is a future of great usefulness open to him, for we apprehend that no one endowed as he is, tutored as he has been by severe experience, and possessing, as he does, such keen sensibilities and expansive sympathies, can fail to benefit those for whom he sings.

#### PRIVATEERS AND PRIVATEERING.

So far as England and France are concerned, the present war bids fair to be conducted on more humane principles, and altogether in a less savage and vindictive manner, than any previous great European contest. France assumed the initiative, we believe, in refusing letters of marque, or commissions to privateers; and England has hitherto done the same; nor is there the least probability that any licence will hereafter be granted to privateers by the British government. Formerly, it was not unusual for letters of marque to be granted even to the subjects of neutral nations, and fears have been expressed that Russia will grant such licences to American privateers. We have not much apprehension on this score, relying securely, as we think, on the honour and policy of the United States' government to suppress any such attempts; for by Acts of Congress in 1794 and in 1818, privateering was denounced, and the Americans are not a retrograde people in any respect. But it is certainly to be dreaded that some of the half-lawless and wholly unprincipled republics of South America may be inclined to avail themselves of Russian commissions to plunder our merchantmen; although if they do so, they will pay dearly for it in the end. It is not improbable that Russia herself will send forth privateers from such of her ports as may escape blockade—but short will be their cruises!

Privateering is, or was—if we may venture to speak of it in the past tense—a mere system of piracy under legal sanction, and proved a monstrous aggravation of the evils of war. Not one spark of patriotism animated the owners and crews of privateers. They neither sought nor desired to meet with the enemy's armed cruisers, for to them glory was a thing of naught. Their sole object was to make money by plunder, and to do this with as little fighting as possible; but if hard knocks could not be avoided, we must do them the justice to say that they did not shrink from the combat, as many an action fought with a gallantry worthy a better cause bears witness. The officers and crews were almost invariably desperate men, and no private peccadilloes whatever could disqualify them for the service, but rather the reverse. The hulks, the gallows, and the privateers refused no man. As a general rule, the owners of privateers were not very honourable nor reputable citizens; yet, half a century ago, hardly a voice was audibly raised in condemnation of their enterprises. The fitting-out of a privateer was a sort of gambling speculation, for the vessel might be captured within twenty-four hours of leaving port, or it might send home a dozen valuable prizes in a cruise of as many days. All was a lottery, and one of the most exciting nature. The captain of a privateer had generally some share in the ownership of the vessel, and officers and crew sailed with a distinct agreement as to what percentage each would receive of the booty. Under such a system as this, the inevitable consequence was, that privateersmen became demoralised and brutal to the last degree. Privateers

and pirates were, in fact, almost convertible terms. In many instances, if a privateer had not the fortune to fall in with any of the enemy's merchantmen during a cruise, he would have little or no compunction in seizing a neutral ship, rather than return empty-handed, and boldly risked all consequences resulting from the piratical act. But the system had yet darker traits, as the following startling statement—anonymous, however—testifies: 'It must be admitted that in more than one flagrant instance, the system was not only brought to bear on English commerce by English capital, but even the very parties who sent out the merchant-ship, and insured her against the king's enemies, sent out also the privateer that captured her, and thus made a double gain—from the insurer of the captive vessel, and by the sale of her cargo and hull as lawful prize. Many a French privateer was owned by Englishmen, and manned by piratical renegades; and some English privateers were chartered by Frenchmen for the capture of their own merchant-ships. In the conduct of such crews, wilful cruelty towards their captives was alone wanting to complete the character of the pirate. On either side of the Channel, the day of the merchant-ship's sailing, and her course, was duly notified to the privateer that did the dirty work of the firm; and thus, under the pretext of honourable warfare, innocent individuals were swindled by their fellow-countrymen, and the honour of a nation tarnished for filthy lucre.' We have no means of verifying this appalling charge, but judging by all we have read upon the subject, we have no reason to disbelieve it.

Privateers, both French and English, were of all sizes and rigs—from mere luggers of twenty tons, carrying a couple of 4-pounders and a dozen men, to fine full-rigged ships of 500 or 600 tons, heavily armed, and manned by crews of 200 to 300 men. In a word, the latter were formidable men-of-war, and capable of exchanging broadsides with regular king's frigates. Many privateers on both sides the Channel were fitted out at immense cost; nothing was spared to render their equipment perfect, for the owners well knew that one successful cruise might pay for all. The main object of all was to insure swiftness; and to effect this, strength of hull was sacrificed to such a degree, that some privateers were mere shells, that a close, well-directed broadside from a man-of-war would send to the bottom in a moment. This, however, was by no means always the case, as we shall hereafter shew. Not a few privateers were expressly built for their intended service, and more beautiful vessels never floated. The total number sent forth both by England and France was almost incredible. They prowled in every direction, and the narrow seas literally swarmed with them. The largest and best appointed would take long swoops out on the main ocean, to fall in with convoys of both outward and homeward bound ships; and if not taken themselves by men-of-war, they were sure to pick up all unfortunate stragglers or slow sailers. If the reader only glanced over a file of old newspapers, or pored—as we have done ere writing this article—through the 'Home News' and Gazette extracts of the old magazines, and the dry details of our chief naval histories, he would soon have a vivid idea of the enormous risk merchantmen ran of being taken by privateers during the last war. Sometimes we read of five or six privateers of the enemy captured in a single day.

We are not aware that the British government ever aided or had any share in the equipment and sending forth of privateers; but it appears that it was otherwise across the Channel. In one instance, a French company hired five swift-sailing ships of their government to cruise as privateers; and official documents prove that many others were lent to adventurous merchants for the same purpose. The charter-party, on the above occasion, says that 'the vessels are to be completely

fitted out by the government; the freighters being only obliged to provide for and pay the crew. The cost of revictualling and touching at any place, to be also at the charge of the freighters; but the cost for repairs of masts, for cordage, ordnance, &c. to be defrayed by the republic. The freighters to propose the commanders, who must be approved by the minister of marine. The freighters to choose the station for cruising, and the places at which the vessels are to stop. The net produce of the prizes to be divided as follows—One-third to the crew, and a third of the remaining two-thirds to the republic; the sale of the prizes to be confided to the freighters.' Many of the French privateers were really splendidly equipped and manned vessels. We find an instance to the point in the *London Gazette* of 1810. In September of that year, Captain Wolfe of the *Aigle* man-of-war, reports that he had captured, after a chase of thirteen hours, *Le Phanix*, a celebrated ship-privateer belonging to Bordeaux, mounting eighteen carronades, and manned with 129 men, whom he describes as being exceedingly fine young seamen, commanded by a very experienced and able captain. This privateer had done great injury to the British trade, and hitherto had outailed all our men-of-war. A still more famous French privateer of similar force, manned by 140 men, *Le Vice-amiral Martin*, was captured in the following year by His Majesty's ships *Fortitude* and *Saldanha*. This very famous privateer had been remarkably successful in all her former cruises, and had defied all attempts to capture her. Nor would she have been taken at last by one ship; for we are told that 'from the style of her sailing, and the dexterity of her manœuvres, neither of his majesty's ships singly, though both were going eleven knots with royals set, would have succeeded in capturing her.'

Several instances are on record of really gallant actions fought between large French privateers and English frigates. A noteworthy affair of this kind occurred in 1798. The British 40-gun frigate *Pomone*, Captain Reynolds, chased the *Cheri* privateer of Nantes; and as the latter made no attempt to escape, the two ships were soon yardarm to yardarm, and a furious battle ensued. At length the privateer struck, after losing her mizen-mast and receiving great damage; so much so, in fact, that she sank almost before the wounded and prisoners could be removed. The privateer mounted twenty-six guns of various calibre, and was manned by 230 men. Her captain and fourteen men were killed, and nineteen wounded. The English frigate also sustained considerable damage. Considering the immense disparity of force, this was certainly a most gallant defence on the part of the privateer. Later in the same year, a memorable action also occurred between the British sloop-of-war *Trincomali*, of 16 guns, and the French privateer *Iphigénie*, of 22 guns. It lasted upwards of two hours, when by some accident the *Trincomali* exploded, and all the crew but two perished with her. The two vessels touched each other at this awful moment, and therefore it was not surprising that the privateer also was so dreadfully shattered, that she sank in a few minutes. All her crew, with the exception of about thirty, perished. A more calamitous finale to a well-fought action has rarely occurred. While on this topic, we must not omit to mention a third important and singular affair about the same time. The British 38-gun frigate *Révolutionnaire*, chased a strange ship off the coast of Ireland; and after a run of 114 miles in less than ten hours, the stranger hauled down her colours, and proved to be the *Bordelais* privateer of Bordeaux, a splendid ship of more than 600 tons, with a crew of 200 men, and mounting 24 guns on a flush-deck. She was reckoned as fast a sailer as any privateer belonging to France, and on her first cruise captured the immense number of twenty-nine valuable prizes! Her second cruise proved thus fatal to her. Concerning this

privateer and the frigate that captured her, Mr James, in his *Naval History*, gives the following curious information:—"It was a singular circumstance, not merely that the *Bordelais* was constructed by the same builder who had constructed the *Revolutionnaire*, but that the builder, at a splendid dinner given by the owners of the *Bordelais* to her officers soon after the termination of her first trip, should have said: "England has not a cruiser that will ever touch her except the *Revolutionnaire*; and should she ever fall in with that frigate in blowing weather, and be under her lee, she will be taken." The *Bordelais* was added to the British navy by the same name." It appears by the above, that the frigate herself had previously been taken from the French, and adopted into our navy. Whatever may now be the case, nothing is more certain than that during the last war the French built the finest men-of-war in the world. Most of the crack frigates then in our navy had been taken from the French, and with them we captured more of their vessels—a fact which must have been bitterly mortifying to that gallant and sensitive people.

Owing to the extreme swiftness of most privateers, it rarely happened that large men-of-war could capture them, unless under particular circumstances. Corvettes of war, and handy gun-brigs, were the vessels to hunt down and destroy these pests of commerce; and they did their duty manfully. Sometimes, however, it happened that they caught a Tartar in the shape of a privateer, and had much ado to escape being captured themselves. As a general rule, both English and French privateers carefully steered clear of all contact with men-of-war, for they knew they could have nothing to hope for but hard blows, and probable discomfiture. It did, however, occasionally happen, that when a privateer fell in with a sloop-of-war, or other small armed ship of the enemy's royal navy, and knew the latter to be of decidedly inferior force, he would risk an attack. Several instances are on record of king's ships being captured, after a hard fight, by one or more daring privateers. For example, the British gun-brig, *Grouler*, well armed, and commanded by Lieutenant Hollingsworth, with a crew of 50 men and boys, was engaged, along with other men-of-war, in convoying merchant-vessels; and when off Dungeness, the *Grouler* was suddenly attacked in the night by two French lugger privateers, the *Epiègle* and *Rusé*; and in spite of a gallant defence, in which her commander lost his life, was captured, and triumphantly carried into Boulogne. It is supposed that the privateers at first mistook the *Grouler* for a merchantman. A somewhat similar affair occurred about the same period. The British armed sloop *George*, Lieutenant Mackey, of 6 guns and 40 men, was attacked and captured in the West Indies by two Spanish privateers, one carrying 109, and the other 68 men. The British crew made a most heroic defence, and did not surrender until eight were killed and seventeen wounded, out of her forty men. The Spaniards had thirty-two killed. On the other hand, some French privateers made quite as determined a resistance against hopeless odds. The British 14-gun brig-sloop *Amaranthe*, with a crew of 86 men, chased the French privateer *Vengeur*, a schooner of only six 4-pounders, and a crew of 36 men, including passengers. At length the two vessels engaged at pistol-shot distance, and the combat lasted upwards of an hour. When the privateer surrendered, her loss amounted to fourteen killed and five wounded. If the immense disparity of force is taken into consideration, this is one of the most desperate defences on record, and proves that the issue of the combat would have been very doubtful had the force been more equal. We could give dozens of similar instances of the desperate courage often displayed both by English and French privateersmen; and this is about the only redeeming trait in their character. It may, however, be safely assumed, that, as a general rule, privateers only fought

when fighting became unavoidable. On rare occasions, French and English privateers fought each other, just as tigers and sharks will sometimes do when lacking their natural prey.

The damage done to British commerce—and vice versa—by French, Danish, and American privateers, was altogether incalculable; and it must also be borne in mind, that the prodigious risk of capture raised the rates of marine insurance to a ruinous degree, so that merchants whose vessels made safe runs, seldom realised remunerative returns on their invested capital; and if, on the other hand, they sent their ships to sea uninsured, they risked total ruin, for it was about an equal chance that a ship sailing to and from many ports would be captured. It is not fair to draw a parallel between regular men-of-war and privateers, as regards making prizes of enemy's merchant-ships. The mere act of capturing an enemy's merchantman is only a sort of episodic performance on the part of men-of-war, their main business being to defend the coasts of their country from hostile invasion, and to fight and subdue the ships of war belonging to the foe. The prize-money they receive from occasional captures is only a legitimate extra reward for the services they perform to the state; while a privateer is sent forth wholly and solely to pursue and capture merchantmen, that its crew and owners may be enriched by their confiscation, the privateers neither defending their country, nor fighting its armed foes, unless reluctantly compelled to do so. These views of the question are now generally held by civilised states; and England, France, and America, the three foremost nations of the earth, seem to have tacitly arrived at the somewhat tardy conclusion, that there is hardly a hairbreadth of practical difference between privateering and piracy. Henceforward, pirates and privateersmen will alike swing from the yardarm whenever captured in pursuit of their kindred professions.

#### A LAUDATION OF TRASH.

It is not many years since *Chambers's Edinburgh Journal* was the only extensive distributor throughout the country of wholesome knowledge and as wholesome entertainment. The case is very different now. Whether that work created a taste, or merely supplied a want, is of little consequence: the great fact is, that the demand did increase, gradually but rapidly, and in that brief interval has been answered by the appearance of other journals, variously modified, which, without diminishing the popularity of the *magna parens*, have more than doubled the circulation of this kind of literature. The importance of the fact, taken by itself, no one will question: it stands incontrovertibly thus—that there are at present at least double the number of persons who seek in the cheap periodicals interesting information and refined amusement than there were a few years ago. This increase is not accounted for by any decline in the sale of expensive books: even if such existed, it would be much more than compensated, so far as the number of readers is concerned, by the popular libraries and reprints, whose name is Legion.

We have heard it said that the progress thus distinctly marked is counterbalanced in another way—that the new demand for wholesome literature is not a tithe of the new demand for what is either positively pernicious, or at best vulgar and trashy. Now, as for the positively pernicious, it does not fairly come, we think, into a question of this kind; for its existence is attributable solely to the supineness of government in not enforcing the laws it has made, or to its stolidity in so constructing the laws as to make the enforcement impossible. But with regard to the immense body of literature distinguished merely by bad taste and low intelligence we have something more to say; for we hold

that the demand it meets is as indubitably a step in advance as the demand for wholesome literature.

The half-million, or more, readers of such works had no existence a small number of years ago. Their minds had not begun to awaken, and they had not yet entered upon that course of progression which is the natural state of human beings. The first stirrings of their untutored thought, when these at length began, found no sympathy in the higher class of literature. They yearned instinctively for something they could feel and comprehend: and the something came. It came in a form of thought just higher than their own, in a play of fancy their humble taste could appreciate, in romantic fiction that could be delightedly enjoyed by minds which had not opened to a conception of the artistical, and had no higher standards of comparison. The thing that came is pronounced by the supercilious to be Trash. Be it so: that name will do as well as another. But we have a profound respect for this Trash; since it has enabled vast masses of the people to enter upon a course of progress, and has commenced a development of their moral and intellectual powers which nothing can stop. It is as impossible to prevent its readers from rising beyond Trash, as it would have been impossible to land them on higher ground without using that as a stepping-stone.

It is vain to talk of the higher class of periodicals competing with the low: they cannot do so without changing their character and becoming low themselves. If the demand had been for high-class literature at a cheaper rate, it would have been met in spite of the paper-duty; but the demand was for low-class literature, and that alone; and if the price of all kinds were equalised, the very same relative circulation would be maintained that exists to-day. And why?—Because readers whose minds are in the earlier stages of development are, and probably always will be, by far the most numerous class. The hostility of the better journals to Trash is unfair and ungrateful, for the latter is their grand recruiting field. Without this training seminary, it could be only by slow and painful efforts they would gain over a single man. They might remain as steady as the journal mentioned at the beginning of this article did for many years; but they could not increase and multiply as they have done, and they would not now spring forward individually as some of us are doing.

Trash is not bought because it is cheap. The cheapness merely brings it within the reach of those who will buy it because it is trash, and who would buy nothing of a better kind at any price. Literature, in so far as the demand and supply are concerned, is subject to the ordinary laws of political economy. It finds its own channel, and will not yield to force; but it is unlike material commodities in this, that it has within itself a principle which insensibly elevates the character of the demand. The reader rises above the lower quality unconsciously to himself; he exhausts the nutrition it affords; and, to appease the continuing hunger and thirst of the soul, he at length seeks a new and richer pabulum.

The real competition is among works of the better class; and this competition, when its object is mere circulation, is not of a wholesome kind. All such works are valuable; and all answer a positive demand, and address themselves to a distinctive class. Some are light and gay, some serious and earnest; some impart information, as if they wished it to penetrate to the mind; others give it through the menstruum of a joke, as good-natured doctors exhibit medicine to children, wrapped in sweetmeats; some minister specially to tastes of one kind, some to tastes of another kind; but all supply a demand, and all represent, respectively, the intellectual status of particular portions of the community. Competition among such works should not neglect circulation, for that would strike at the

root of utility as well as profit; but it should take the character of a generous rivalry, as to which competitor, without compromising its popularity, should do the most to inform, enlighten, and refine.

But our present business is with Trash—praiseworthy and respectable Trash. Let it not grudge the recruits it educates and turns over to a higher service, for this loss will be more than compensated by a daily addition to its own numbers rising from the denser and darker masses of the people. It will never be otherwise than a great and powerful estate in literature, so long as there are children of men born in ignorance and misery, and impelled by the instincts of their nature to grope after light and knowledge. It is true, there are powerful influences at work against it; for the connection between taste and virtue has been recognised even by government, and, so far as material objects are concerned, there are now schools of design throughout the country, in which refinement is taught as a matter of policy. This, no doubt, will eventually contribute towards the general elevation of the people; but it is comfortable for Trash to think that the process will be so slow as to be hardly perceptible, the new movement not being in the direction of literature, but of the arts—the education considered necessary not being that of the mind, but that of the eye.

We end as we began. Trash is one of the great facts of the age; and we trust that its half-million patrons may increase rather than diminish. They cannot increase from the higher ranks of intelligence—that is impossible; for the spirit of man ascends as the sparks fly upwards. Teach a little gamin merely to read and write, and he takes to Trash as naturally as a duckling takes to the ditch; but, unlike the duckling, he is by and by hungered upon the nutriment he finds in it—his taste expands, his aspirations soar, he becomes ambitious of the pond—then of the lake—then of the ocean. *Vivat Frivola!*

#### ADVANTAGE OF OPPOSITION.

A certain amount of opposition is a great help to a man. Kites rise against, and not with the wind. Even a head-wind is better than none. No man ever worked his passage anywhere in a dead calm. Let no man wax pale, therefore, because of opposition. Opposition is what he wants, and must have, to be good for anything. Hardship is the native soil of manhood and self-reliance. He that cannot abide the storm without flinching or quailing, strips himself in the sunshine, and lies down by the wayside to be overlooked and forgotten. He who but braces himself to the wind to struggle when the winds blow, gives up when they have done, and falls asleep in the stillness that follows.—*John Neal.*

#### PROPOSED CHANGES IN INLAND CONVEYANCE.

It is a somewhat curious coincidence that, at the very juncture when companies are making a merit of using iron sleepers, as well as of adding to the strength of their rails, a project should be submitted for public consideration by which iron is to be banished from railway construction. According to Mr Daft's prospectus of his infant invention, not only are sleepers to continue to be made of wood, but wheels, axles, springs, and all their complexities and combinations, are to be abolished, and carriages made to glide by a glass groove upon a tri-edged wooden rail. This, however, is a mere adjunct to the invention itself, the chief innovation of which consists in making the engine-wheels of brass, and strongly coating them with vulcanised India-rubber, the tenacity of which is strikingly exemplified on the model, on which they remain stationary at any gradient, even 1 in 8.—*Railway Times.*

## DREAM-LAND.

Artists and poets have alike fallen short of the finer and more ideal embodiment of the wonder-worker—'care-charmer, sleep.' The cry of the guilty thane:

*Macbeth hath murdered sleep—the innocent sleep,*

conveys but one of the numerous morals lying obviously on the very threshold of a beautiful idea. In depicting 'Death's half-brother,' Thorwaldsen has touched but its outward semblance, while giving us the deep and solemn hush of an apparently unbroken repose. This is not enough. As a creation, vital in itself and life-producing, as the still partner of the soul and gracious mother of dreams, sleep has never yet been worthily portrayed:

Our life is twofold. Sleep hath its own world;  
A boundary between the things misnamed  
Death and Existence.

Sleep has a reality of being essentially its own, however distinguished from the life of waking fictions in the midst of which we walk daily, and where the things we see, and the deeds we do, and the thoughts that strive within us, have scarcely a more distinct vitality than the stuff of which dreams are made. Take from us our Dream-land, and the beauty of life—nay, the very world itself—were incomplete. The marvellous significance of the shapes we meet within its filmy shades, growing out of darkness and reappearing into shadow—shapes, crowning the brief torpor of our outward sense with a dazzling glory such as we meet not on this side the great sleep-barrier; the wonderful depths of soul therein revealed to us, as in a magic glass, through silent trances of the night, from whose waking is agony; the exalted, almost superhuman purity of thought and act, which in such visions shews us something of what we are capable, and shames the waking sense of what we are—these are at once the solace and the boon, the privilege and the blessing, of Dream-land. In our frailer, living hours we may cry:

Let the dead Past bury its dead;

but in Dream-land there are no dead—or rarely those over whose dust we are left weeping here. The loved and the lost are ours again. We hold them, gathered to our inmost hearts, with an intensity of joy, into whose Eden there will sometimes creep, serpent-wise, it is true, the strange, cruel, vague misgiving that it is all a dream—for, alas! the trail of the destroyer is even here. But seldom do such doubts force themselves

from that imaginary world, and entering once more upon the confines of that which we in sober parlance call real, waking life. So the pang is dealt by the watchful, world-day mind, after all, and Sleep and Dream-land are innocent of this Saturn-like demolition of their own offspring.

Dream-land, too, has other phantoms than those of the beautiful and the loved. Some of its presentments, Gorgonite and grotesque, at times glide unbidden through the silent chambers of the brain, 'making night hideous.' Yet, by a strange anomaly, our sense of wonder is most dormant when its exciting forces are the strongest. We marvel at nothing; everything is taken for granted. We sally forth for a morning's ride across the mountains of Kong, or trace the sources of the Senegambia, perched on the shoulders of a tough-hided Cheiropotamus, yet are not 'afraid with any amazement.' We undertake a journey to the setting sun, ensconced between the outspread wings of some giant condor of an elder world, yet neither wink nor wince. Our faith is as perfect, and our enjoyment as keen, during these somewhat startling innovations in the ordinary laws of human progression, as those of a child when he listens to the recital of similar feats in his first fairy-tale. If we cannot take the 'wings of the morning,' we can at least take those of the night; and the power and strength of its broad pinions are illimitable. Strange combinations, too, of romance and terror will occasionally 'disturb our souls with pity.' I once noted down a dream suggested by the reading of an eccentric American story; and in which certain features of the tale became oddly enough mixed up with more solemn matters. The story was that of a certain Texan colonel; and in its effect on the train of thought during sleep, is a somewhat curious instance of the power of passing and trivial occurrences to call up in dreams a chain of corresponding or analogous ideas. The story was something to the following effect:—The aforesaid colonel, at once a settler in the backwoods and a lawyer, being engaged to defend a man for cow-stealing at the distant town-court—for which defence he is to receive two bushels of meal—and being in want of a suit of clothes to appear in, procures from an Indian a suit of deer-skin. This he is recommended to dye in dogwood ooze; and as the trial is to take place on the following day, and the meal is sadly wanted at home, our colonel, obliged perforce to set out in all haste, puts on his deer-skin—wet. Speeding along under a broiling sun, his condition may be imagined. As the skin grows drier and drier, the unfortunate wearer describes himself as 'screwed together, bound up, and strangled.' He can move neither hand nor foot: till at last some mad Samaritan

rips him up, or rather his borrowed skin, amidst peals of laughter. It is enough to add, that, relieved of his shrivelled-up deer-skin, our lawyer, finally adopting some more commodious form of enrobement, reaches the court in time, 'clears his man, and gets his meal.' Amused with this story, I fell asleep. I was immediately transported, in thought, to a narrow, gloomy lane. Before me was a man running at full speed, from whose shoulders hung a long fur-cloak. Prompted by some unaccountable feeling of curiosity, I gave chase. Swiftly as he fled, he was soon outstripped by his pursuer. As I passed him, the wind for a moment turning his fur-cloak aside, shewed me the lining dabbled with blood. I was told that he was a murderer escaping from justice. All at once, my dream changed. I found myself seated in some public place, which looked very like a theatre; and turning to my friend, Mr M., the dramatic poet, who stood beside me, I was informed by him that it was in reality a court of justice, and that I, as well as he, was 'had up' to give evidence against the culprit, who turned out to be no other than the above-mentioned runner in the fur-cloak. Here—for at this interesting juncture I awoke—the trial for cow-stealing was converted, by the force of a drowsy imagination, into a trial for murder; while the improbable colonel and his impracticable suit of deer-skin became, by a similar agency, converted into a very truculent culprit, figuring in a handsome coat of fur. Though I was not the lawyer, I was the witness, and thus found myself cutting a questionable figure in a court of justice. Whether 'I cleared the man,' or 'got the meal,' I have no positive recollection.

Such are among the apparently meaningless combinations of things that haunt our night-watches, leaving behind, when they depart, no lasting impression. There exist, however, mysterious forces of the spiritual world which carry their influence long after through the silent vigils of our waking and world-weary hours. What the pressure exerted by those forces must be to the mind laden with premeditated guilt, or goaded by the stings of remorse, we have no imagination strong enough to depict. No phantom can rise before our ordinary sleep-vision at all comparable in horror to what such a nightmare must present; neither, to the culprit, can any throes of waking agony equal in terror those of the inner soul of sleep. When the stricken Queen Elizabeth, in her last hours, grovelling in the dust—her finger in her mouth, idiot-wise—sat, gazing vacantly on the clock, were her hauntings of conscience more terribly real than the wandering horrors that pursued her in her dreams? In such daylight reveries, the presence of outward objects tends to break the links of thought, and disjoin the retrospective chain within the mind; and to the royal culprit's ear, the click of the time-piece, with its warning beat, would at last lull the sense that ached at its monotonous sound. But her *dreams*! No visible object then would stand between her and the block, crimsoned with the blood of her beautiful foe—no sounding knell of the passing hours muffle to her ear the last sigh that was ever to pass the sealed lips of her much-prized yet slaughtered friend. All would rise before her soul in its naked horror; till, easier and lighter to bear were such waking idiocy, than the wilder madness which shrieks on the confines of that ghastly borderland of dreams.

But—thanks to the Giver of all that is good within

us—there are gentler and more soothing influences also at work within that wondrous region—

The baiting-place of wit, the balm of woe,  
The poor man's wealth, the prisoner's release,  
The indifferent between the high and low!

Sometimes, it is but the touch of a hand—a smile, or a sigh, that thrills through, beams upon, or sounds to us, as nothing in this our so-called actual world can do. That a benevolent purpose—a wise, forecasting care—lies at the root of even the most seeming strange phantasms of Dream-land, we cannot but believe. The crushing anxieties of the outer world, its crosses, its pangs and desperations, fall off from us like mists at the sun's call, before the heavenly aspect of some face whose idolised memory, dwelling apart in the hidden treasure-house of the brain, and cherished by the dreaming heart of love, is roused anew, and touched with a more solemn glory, in the great phantom-world of sleep. Even our night-sorrows—for mortal agonies will find us out even here, and Dream-land has its

hurrying to and fro,  
And starting tears, and tremblings of distress,

and pale fair cheeks, and

sudden partings, such as press  
The life from out young hearts—

even those sorrows have a tender and subduing influence, and do their work of regeneration, as all trials must, whether they come to us from the world of shadows or of realities. As the deeper impressions of the night cling to us, undissipated by the pale spectral light of day, we rise to our duties, hard though they may be, with a freshened heart and a renewed spirit. We are no more forlorn, who can turn—even though with tears—from the harsh looks or unquiet voices of earth, to the sweet, placid, angel-like greeting of a dead love in Dream-land. There is no barrier to separate us from that bliss; it is ours to have and to hold, to rejoice in, and to be thankful over. If it be but a phantom—what of that? It is 'a thing of beauty;' it is 'a joy for ever.' Gathering round us, and prolonging thus—even though as shadows—the pure and blest associations of a perished youth, we live our failing and degenerate days to better and holier purpose. Blessed be all dreams, sleeping or waking! The greatest and most profound woman-writer of our age—perhaps of any—has well said: 'By the gentle leave of Heaven, all human beings have visions.' So be it! and let none despise the dim but certain manifestation of the spirituality within them, nor dare to ignore the lightest indication of those divine laws whose meanings lie beyond their ken. What is memory itself but a dream? Yet how vast is its range—how blessed are its uses—how full of soul its marvellous resurrections! We all alike confess to the beauty of its tender revelations of past joys and sorrows, when our eyes gaze wide upon the moving world before us. How doubly to be prized, then, are such visitations, and all that are akin to them, during those hours of darkness, when the rapt sense, no longer clay-controlled, beholds, as it were, the very heavens themselves unveiled.

Jean Caspar Lavater has said: 'Keep him at least three paces distant who hates bread, music, and the laugh of a child.' Keep him, say we, distant three

paces more who can smile in derision at the silent and solemn teachings, the incomparable joys, of Dream-land.

## CUSTOMS AND MANNERS UNDER THE WATER.

SCIENCE has become intimate with animal life on the land—even with those creatures that are too minute to be seen with the naked eye; but, till recently, the ocean appeared to baffle its researches, and in its turn to say to man, in the hollow and mysterious voice that threatens as well as charms: 'Thus far shalt thou go, and no further!' But all was in vain. Science, which explores the further heavens, was not to be arrested in its progress by the waters; and moving steadily onwards in this new direction, it has now invaded the depths of the sea, and examined, with its calm, observant eye, the forms and manners of its inhabitants. This has not been accomplished by means of perilous adventure—and, indeed, no perilous adventure could have achieved the feat. The French zoologist who proposed, some time ago, to pay a domestic visit to the fishes of the Mediterranean, provided with a water-tight dress and a breathing-tube, would have come back doubtless well able to furnish a pleasing superficial sketch, but quite ignorant of those minute details of individual life which form the materials of natural history.

This is well illustrated in a beautiful little work now before us, in which the author declares that the records of animals which form the foundation of all our correct generalisation, are strictly biographical.\* He traces an idiosyncrasy in the lower orders of creation somewhat akin to that of man; remarking that the shepherd recognises every sheep of his flock by its face—that the groom is a physiognomist in horses—and that he himself comprehends the expression of birds. By this alone he was able, while in Jamaica, to tell one from another the wild doves in his cages, although they were perfectly alike in colour. 'Shakespeare and Scott,' adds Mr Gosse, 'who treat of man as an individual, are not inferior, in their walk of science, to Reid and Stewart, who describe him as a species.'

To visit the inhabitants of the sea, in the constrained manner that would have been compulsory in a being formed like man, would have been of little use as regards biographical details. What, then, was to be done? To bring them to us, to be sure, since we could not go comfortably to them—to have them up in a witness-box, and make them give an account of themselves. But it was necessary to do this in a particular way, for fish are no more at their ease out of the water, than we are under it; it was necessary to bring a portion of their element with them, and to have all their little comforts about them, such as stones, sand, mud, and marine-plants; it was necessary, in short, for the purposes of science, to have a *piece of the sea* laid upon our table: and, being necessary, this was done. The principle upon which the Aquarium is constructed—the mutual dependence of animal and vegetable life, the former supplying the carbonic acid essential to the latter, and the latter the oxygen essential to the former—is already known to our readers; and we have only to add, that the desired portion of the sea, with its animals, plants, rocks, and sand, is contained in a glass tank, and that thus the philosopher has nothing to do but to sit down in his night-gown and slippers, and watch the goings on, and pry into the family secrets—using his lens when necessary—of the inhabitants of the deep.

To preserve the transparency of the tank would seem a difficult matter, from the floating myriads of spores

or seeds of the algae that are constantly finding a resting-place on the glass, and trying to curtain the whole from the water's edge to the bottom. To avert this danger, we employ a couple of little slaves, the common periwink, and as common top (*Trochus*); and these creatures go constantly about, shearing away the tender growth of vegetation as soon as it is formed, and taking the crop in lieu of wages. Mr Gosse watched, through his pocket-lens, a top at his work; and this was the *modus operandi*: 'At very regular intervals, the proboscis—a tube with thick fleshy walls—is rapidly turned inside out to a certain extent, until a surface is brought into contact with the glass having a silky lustre: this is the tongue. It is moved with a short sweep, and then the tubular proboscis infolds its walls again, the tongue disappearing, and every filament of conferva being carried up into the interior from the little area which had been swept. The next instant—the foot meanwhile having made a small advance—the proboscis unfolds again, the tongue makes another sweep, and again the whole is withdrawn; and this proceeds with great regularity. I can compare the action to nothing so well as to the manner in which the tongue of an ox licks up the grass of the field, or to the action of a mower cutting down swath after swath as he marches along.' The tongue with which the confervoid plants are swept away, is a curious instrument: 'It is, in reality, an excessively delicate ribbon of transparent cartilaginous substance or membrane, on which are set spinous teeth of glassy texture and brilliancy. They are perfectly regular, and arranged in three rows, of which the middle ones are three-pointed, while in each of the outer rows a three-pointed tooth alternates with a larger curved one, somewhat boat-like in form. All the teeth project from the surface of the tongue in hooked curves, and all point in the same direction. The action of this sort of tongue is that of a rasp, the projecting teeth abrading the surface of the plants on which the animal feeds, just as the lion is said to act with the horny papillæ of his tongue on the flesh of his victim.'

Among the strange animals described by our author as inhabiting his Aquarium, is the cephalopod called the *Sepioida vulgaris*; a curious little creature, which, when first taken from its native haunts, betrays much agitation, but finally suspends itself in mid-water, 'like a brown moth hovering over a flower,' with its protuberant eyes gazing on either side. 'While thus hovering motionless in the water, the sepoida presents a fair opportunity for observing its curious transitions of colour, which are great and sudden. We can scarcely assign any hue proper to it. Now it is nearly white, or pellucid, with a faint band of brown specks along the back, through which the internal viscera glisten like silver; in an instant the specks become spots, that come and go, and change their dimensions and their forms, and appear and disappear momentarily. The whole body—arms, fins, and all—the parts which before appeared free, display the spots, which, when looked at attentively, are seen to play about in the most singular manner, having the appearance of a coloured fluid, injected with constantly varying force into cavities in the substance of the skin, of ever-changing dimensions. Now the spots become rings, like the markings of a panther's skin; and as the little creature moves slightly, either side beneath the fin is seen to glow with metallic lustre, like that of gold-leaf seen through horn. Again, the rings unite and coalesce, and form a beautiful netted pattern of brown; which colour increasing, leaves the interspaces a series of white spots on the rich dark ground.' These and other phases are every instant interchanging, and passing suddenly and momentarily into each other with the utmost irregularity. But here is a change! One is hovering in quiescence, his colour pale, almost white; one of his fellows shoots along just over him: with the

\* *The Aquarium: an Unveiling of the Wonders of the Deep Sea.* By Philip Henry Gosse, A.L.S., &c. London: John Van Voorst. 1854.

quickness of thought, the alarmed creature turns from white to a uniform deep brown, the rich full colour suffusing the skin in a second, like a blush on a young maiden's face. The hue is very beautiful; it is the fine, deep sienna-tint of tortoise-shell; a substance which, indeed, the mingling clouds of brown and pellucid horn closely resemble in the intermediate phases of colour.

The Black Goby is a ferocious little cannibal, about three inches long. Like other robbers and murderers, he loves the dark, lurking at the bottom under the shelter of rocks and weeds. If very hungry, however, he will dart up even to the surface to seize his prey; but turning instantly, he will dive down again into his lair. A youngster of the same tribe, but of a different family, was put into the tank, and unfortunately caught the eye of the skulking goby, who at once made a dash at him, and caught him by the tail, ingulfing it in his capacious throat. 'The Blackie glared like a demon, as, with dilated head, he held fast his victim, clutching further and further hold by repeated jerks: the delicate, pellucid head of the unfortunate prey, projecting from the cavernous mouth, panted and rolled its eyes in pain, but there was no escape; for now nothing was visible but the head, when the ferocious victor shot under an umbrageous weed, and on my next sight of him all trace of his meal was gone.'

Among the denizens of the Aquarium was rather a rare animal, the strawberry-crab, so called from its being studded with pink tubercles on a white ground; and between this creature and the orang-outang Mr Gosse traces a somewhat striking analogy. 'The strawberry-crab,' says he, 'is a climber. If it were a terrestrial animal, I should say its habits are arboreal. True, it now and then wanders over the bottom of its abode with slow and painful march, the hind-feet held up at an angle above the level of the back; but generally it seeks an elevated position. We usually see it in the morning perched on the summit of some one of the more bushy weeds in the Aquarium, as the *Chondrus* or *Phyllophora rubens*, where it has taken its station during the night, the season of its chief activity, as of most other crustacea. It interested me much to see it climb: seizing the twigs above it by stretching out its long arms alternately, it dragged up its body from branch to branch, mounting to the top of the plant deliberately, but with ease. While watching it, I was strongly reminded of the orang-outang at the Zoological Gardens: the manner in which each of these very dissimilar animals performed the same feat was so closely alike as to create an agreeable feeling of surprise.'

Every page of this fascinating work is quotable; but perhaps nothing will be read with more pleasure than the account of the *Aphrodite*, or sea-mouse. 'In the Aquarium the sea-mouse crawls restlessly to and fro, and round the margin of the bottom; once or twice I have seen it essay to burrow under the fine gravel, but generally it lives exposed. It is uninteresting in its manners, though the brilliance of its changing colours will always attract admiration. Perhaps it is most beautiful by candle-light, when red and orange reflections predominate; by day, pearly greens and blues prevail. This difference is owing to the position of the light, and the angle at which it is reflected. Thus, if the eye glance along the bristles towards the light, which is reflected at an obtuse angle, the reflected rays will be lilac, passing into ultramarine; if the angle of reflection be a right angle, the rays will be green; if the light be between the observer and the animal—not directly, but obliquely, so as to make the angle of reflection more or less acute—the reflections will take yellow, orange, scarlet, and crimson hues.'

The most curious part of the sea-mouse is the expiratory machinery. 'As it crawls, the *Aphrodite* usually elevates the tail, which is so folded together as to form a deep groove beneath. By watching this, we see now

and then ejected a stream of water, with considerable force. I found that the jet occurred once in twenty-five seconds, with punctual regularity. This is a respiratory act. The grooved orifice through which the jet is poured is not the termination of the intestine, as we may at first suppose, but the exit of a capacious chamber, which is external to the body, though concealed. A very marvellous and quite unparalleled structure here comes into view. If we take a sea-mouse into our hand, we see the whole breadth of the back occupied by a woolly substance, closely resembling felt, and formed by the interlacing of fine hairs. If we insert a penknife into the tail-groove, and slit up this felt-like cover, we expose an ample cavity running the whole length of the animal, the floor of which is the true skin of the back, on which are set two rows of large overlapping plates, or membranous scales (*chitra*). The dense tissue of interwoven hair resembling felt acts as a filter for the water to be respired, straining off the earthy particles held in it, which thus accumulate in its substance, and impart that peculiar dirty appearance which it possesses. The scales, according to Dr Williams, are periodically elevated and depressed. In the former action, the water permeates the felt, and fills the vacuum formed between them and the back. As soon as it is full, they collapse, and the filtered fluid, now deprived of its oxygen, is forcibly expelled at the anal groove.'

Mr Gosse throws much new light upon the manners of the soldier-crab, a creature destitute of the usual defensive armour of his tribe, but making up for the want by courage and address. He seizes upon any empty shell of suitable size, and makes it his habitation; and it is curious to observe him in the Aquarium becoming discontented with his house, and looking out for a new one. This process, however, has been frequently described; but it is less known that the soldier has generally a fellow-lodger inside, while the roof of his dwelling, the spire of the shell, is often the chosen abode of an anemone. This extraordinary creature is a parasite, although it has been known to exercise some volition in choosing its site. When displaced from a shell, it will plant itself on a stone by means of its suckers; but of its own good-will, it would always get upon the roof of another individual's wagon, and so enjoy the pleasure of being carried about. The anemone resembles a tall, thick pillar, surmounted by a fringe of tentacles, that wave gallantly at every motion of the Sinbad chosen for his porter by this Old Man of the Mountain. The companion who chums inside with the soldier is a worm—but we will allow our naturalist to introduce him: 'While I was feeding one of my soldiers by giving him a fragment of cooked meat, which he, having seized with one claw, had transferred to the foot-jaws, and was munching, I saw protrude from between the body of the crab and the whelk-shell, the head of a beautiful worm (*Nereis bilineata*), which rapidly glided out round the crab's right cheek, and, passing between the upper and lower foot-jaws, seized the morsel of food, and, retreating, forcibly dragged it from the crab's very mouth. I beheld this with amazement, admiring that, though the crab sought to recover his hold, he manifested not the least sign of anger at the actions of the worm. I had afterwards many opportunities of seeing this scene enacted over again; indeed, on every occasion that I fed the crab, and watched its eating, the worm appeared after a few moments, aware, probably, by the vibrations of its huge fellow-tenant's body, that feeding was going on. The mode and the place of the worm's appearance were the same in every case, and it invariably glided to the crab's mouth between the two left foot-jaws. I was surprised to observe what a cavern opened beneath the pointed head of the *Nereis* when it seized the morsel, and with what force comparatively large pieces were torn off and swallowed, and how firmly the throat-jaws held the

piece when it would not yield. Occasionally, it was dragged quite away from the crab's jaws, and quickly carried into the recesses of the shell: sometimes, in this case, he put in one of his claws, and recovered his morsel; at others, he gave a sudden start at missing his grasp, which frightened the worm, and made it let go and retreat; but sometimes the latter made good his foray, and enjoyed his plunder in secret. The worm is itself a striking, and even handsome animal; and there is in its colours and their distribution—two bright white lines running through the whole length on a light red ground—a curious similarity to the colouring of the crab. This worm, we may add, is much prized by fishermen as bait; and so commonly is it found in the companionship above described, that at Weymouth they always break the shells tenanted by the soldier-crab to look for it.

The common cockle, one would think, has not much more facility of voluntary motion than the anemone; but in reality its gymnastic feats are of some note. The tuberculated cockle, however, the giant of the tribe, is quite a formidable vaulter; and when a number of them are thrown into a heap, they seem to defy the riot act. Our author once turned out some of these creatures into a dish, as he knew they liked the air sometimes; but by and by, when the family were quietly reading, an awful uproar began among them, as if a crowd of flint-stones were battling and rattling over one another.—We must now have done, however: many of our readers will doubtless get the volume for themselves; and, independently of its other merits, they will find it a fitting ornament for the drawing-room table, on account of the gorgeous chromo-lithographs with which it is illustrated. Some will likewise find it important to be able to obtain, in so agreeable a way, full instructions for forming a marine aquarium, with the cost of the different sizes.

## CHANGE FOR GOLD.

### PART II.

THAT week I passed in a strange state of exhilaration. I had no doubt of the change awaiting me: I made my preparations as though it would certainly take place. I was more affectionately behaved towards my poor wife for that short time than I could have thought possible. I felt the sort of attachment and melancholy interest in her we feel towards mere acquaintances when we or they are upon the point of setting out upon a long travel and for many years. I put aside, so as to be easily discovered after my departure, a statement of my determination to absent myself from her for ever. All blame I laid upon myself, as, indeed, I might well do, and bade her adieu in kindly but unloving terms. My whole property I placed legally in her own hands. I do not know, even at this time, had my wife shewn much pleasure at my novel kindness, and repaid it with warmth on her own part, whether I might not have been shaken in my purpose. I shall not forget her look of wonder at the unaccustomed kiss I gave her tenderly as I left her upon that fatal morning. I am not surprised that she so readily believed the seeming proofs that subsequently came to light of my having put an end to myself.

In the same place, at the appointed hour, I found the man awaiting me. He saw by the expression of my face that I was still determined to accept his offer, and as we drove along together in a hired cab, rehearsed the conditions of our bargain. I was to submit to any alterations in my personal appearance he thought fit; until his death occurred, or ten years had passed away,

I never was to reveal myself, nor disclose my name to any of my old companions whosoever; I was to come to him whenever he so wished it, and see him at least four times within the year. In return, I was to receive the sum of £50,000.

I thought of every possible contingency—alas, save one!—that could occur to make this bargain insupportable; but the touch and sight of the cheque he put into my hand for the whole amount—the visions of vague but brilliant joys that thronged my brain—the consciousness especially of vast and independent power, would have drowned in a sea of dazzling expectation far greater scruples and objections than mine. I scarcely attended to my companion, such dreams were in my mind. He knew what was beating at my heart, and flushing my forehead, and smiled sardonically. If anything would have made me hesitate, it would have been that curling lip: it told of knowledge, indeed, but of the bitter and forbidden fruit of it; of power, too, but likewise contempt of power. To me, he was as a grown-up man that grimly smiles on a poor boy who has his school-time yet to come; a skilful surgeon watching a curious case he well knows must end fatally—nay, rather experimentalising on it, without more care or tenderness than the sharp, cold blade of his own lancet. We stopped in Golden Square, at a great dingy house, and were ushered into a parlour, lit up by candle-light, upon whose table there lay fruits and wine; some strange preserve of which he ate but sparingly, was more delicious than aught I had ever tasted. In spite of my anxiety and excitement, a dreamy, soothing sensation fell upon me after I had partaken of it. I could not keep my eyes from closing heavily again and again, recovering myself each time with greater difficulty; and at last giving up the struggle, I fell into a profound slumber. I know not how long I slept. When I awoke, I found myself in a hotel in Jermyn Street that was familiar to me—the same, indeed, wherein I had passed my honeymoon. What most surprised me, as I looked around, was the extraordinary suppleness of my neck. Upon reaching my hand up to it, also, I felt a freeness of limb that I had never before experienced. Casting my gaze upon it for the first time, I beheld the skin of a West Indian: I had become a Creole! Upon springing out of bed to the pier-glass, I found the reflex of quite another person than myself. I was metamorphosed, not unfavourably, into a polished 'bronze'; my hair, which had been of a light tint, was now as black as ebony; short black moustaches were upon my upper lip; and, ye gods! earrings, little gold earrings, upon either cheek. An enormous portmanteau lay in a corner of the room, inscribed 'Mr Eugene Lecroix, Antigua.' One frantic effort I made with soap and brush, that reminded me of the washing of the blackamoor, and I sank down exhausted with my fruitless labour, with all the languor that was peculiar to my now native clime.

Putting on a magnificent crimson dressing-gown, that made me look like Othello in the play, I entered the sitting-room: the card of one of the merchant-princes of the city lay upon the table; a note also, informing me that £50,000 had been paid into his house for me, and offering to introduce me, fresh from my far western home—that was, if he had but known it, Paddington—to everything and everybody.

A jerk at the bell brought up a mulatto servant; he had been ordered to attend upon me as cicerone by the great lord. It was a rare notion, and tickled me amazingly, that I, who had become in my wanderings perfectly acquainted with every part of town, should have it explained and expatiated upon by a black fellow.

Rich as I was, it seemed my riches had been magnified. Quite an army of waiters were drawn up in the hall to do obeisance as I left the house; the landlord himself—whom I recognised by *not* having seen him

before when I was plain Mr Branksome—held the great door wide open, and ‘ducked’ profoundly as I passed him. My get-up was of the completest. A private cab, with an unexceptionable horse and tiger, was in waiting, and off I drove, amidst a murmur of applause, to Lombard Street. I strode through the swinging portals into the great changing-room, and thence, by the ‘Open Sesame’ of my name, into the sanctum sanctorum of the merchant. The wrinkles of the dry old man smoothed off at my approach, his white lips puckered into parodies of smiles. ‘His lordship had informed him’—‘Of what?’ I broke out indignantly, for our bargain included silence—my patron’s part equally with my own. ‘Of my vast expectations, and present great possessions in the West Indies. Could he be of any service? His little place down in Surrey was entirely at my disposal. Mrs Guestrode and his daughters would be so delighted.’ I thought the delight of these young ladies would have been mitigated could they but have guessed at poor Mrs Branksome, but professed a proper fervour of desire to be presented to them. I drew L.1000, settled about the investment of the rest, and took my departure, gracefully attended by the old gentleman to the door of his den.

I felt scarcely any scruples about the vexation I must have been causing to my deserted wife and the rest of my relatives; I tried to assure myself that they felt as indifferent to me as I to them; I portrayed to myself the future, and the delights that wealth should offer me, and shut out from my remembrance every picture of the past. I was happy in an anticipation rarely, and in a fulfilment never: the mammon-god had indeed taken me for his own.

The thoughts and acts of the early part of my second life are almost passed away from my mind; but I well remember an advertisement in the *Times* newspaper from my dear mother, that wrung even my heart: ‘If James would return to them, only return, and deliver them from their suspense, a separation between him and Lucy should be effected immediately.’ And shall I ever forget, while life lasts, this second notice, a few months after my change?—‘James, by a father’s name, if you are yet alive, you are entreated to come home, or write, if it be but one single word.’ Yes, I, that had neither name, nor friend, nor tie upon this earth, as I had thought—I, who had dreamed of escaping from myself and all that belonged to me, had now—a son. How I cursed my wealth and him that gave it; the cold, hard, childless man, who held me to my bond for all my prayers, and analysed my father-thoughts and natural love with such proud scorn, and made me butt for his sharp bitter shafts of worldly wit and bad experience: ay, dead though he be, I curse him to this hour!

Through my whole new reckless life, the knowledge that the attention paid to me was due to my wealth alone, I never could cheat myself into forgetting. Naturally of a warm and friendly temperament, but possessing as well a keen insight into the character of others, I found fresh friends—that I could call such even for an hour—impossible to gain. Sometimes, indeed, I met an old one—Clement, for instance, whom I had used so ill at college—and sad, indeed, such meetings were for me. It was at a great colonial dinner-party, where governors, and judges, and consuls were as plentiful as pine-apples, that I found myself next to his Excellency of Boonipootang. Changed almost as much as I myself, was that clever, honest man from the fast fellow-commoner I had known him—but, ah, how much for the better!

I recalled his college-life to him by cunning questions; I interested and drew him towards me, as of old; I dared even to mention my old name to him, as of one unknown to myself, but distantly related. He drew my portrait far more favourably than I had hoped, but his closing words spoiled all: ‘This poor young man, you

should remember, was your relative, and that we should not speak ill against the dead;’ for dead I was supposed by all to be. A body had been picked up down the river, in too decomposed a state to be recognised, and that body personated me.

Whenever I mentioned my former self—miserable eaves-dropper as I was—I never heard much good of it. The publishers trod heaviest on my vanity of all (for my passion for print was as strong as ever, and much more easily gratified, in that the West Indian millionaire, with lifelike sketches of his own luxuriant property, was not a contributor to be sneezed at): my relative, Branksome, I was informed, in answer to kind inquiries, could neither imagine nor describe, told truth ill, and lied ungracefully; and the worst of it was, poor devil! had drowned himself, because his articles were so often rejected. ‘So determined was the act of suicide, that he had put one of his own essays in each pocket to sink him.’ If the wit could but have looked into the heart of his smiling listener, it would have damped his merriment, and altered his opinions on one or two subjects.

Moreover, casually, at club-houses, I met with old acquaintances by scores—men with whom I had been hand and glove, social, friendly, and even sympathetic; and I learned, as few ever learn, how soon and utterly the remembrance of the dead is swept away—how ill it would fare with them could they return among the places that refuse to know them more.

As for my brother, he had long been made a college don; and when I sat next to him once at the vice-chancellor’s, the worst he had to say of me was, that I had ‘thrown my time away at the university, married early, and ended’—I think he said—‘injudiciously.’

My new associates were generally the higher class of ‘men about town,’ guardsmen, attachés, young M.P.s; and such like. They pleased me best, because what little kindly warmth lay in them—the outer coat of artificial ice first broken through—was easily accessible. They were, indeed, incapable of friendship; but, alas! was I the man that dared cast stones at them for that? Arm in arm with one of these *nil admirari* folk, it was a terrible thing for me to meet my fell enchanter. He was getting very old and feeble, and his ghastly smiles struck home through my soul. When young Frank Pretzman, M.P., observed of him, that he was ‘a rich feller, but deals with the dayvil, don’t he?’ it gave me quite a shock. His lordship never asked me any questions now about my state of mind; a look at me from those yet sharp eyes of his was quite sufficient. Indeed, what with my colour, and the dropping in of my cheeks, and lacklustre, used-up expression altogether, it was hard for my very self to believe in my own identity. Ah, how even in writing of these things, do I keep clear of the only subject that really interests me: in describing this second life of mine, how morbidly do I omit the one thing that was the soul of it! How I craved to look upon that single kindred face my eyes had still not tired of—those unknown but beloved features of my fatherless child! How, in the long dark winter-nights I have paced for hours before the house wherein he lay, and prayed God’s blessing on him, and watched for him at all times; and in vain! How I begged of my hard taskmaster to let me but reveal myself to my own son, and he would not! Suppose that I should not be able to persuade the child at all that he was mine! suppose that, if I did, he should grow up in hate and fear of me! What hideous thoughts and dim forebodings filled my heart!

Four years had yet to pass before I should be free, when my wife and child left London in the spring, to stay with my mother in Shardale. To be absent altogether from the boy, I could not bear; and ‘longing to see the ancient haunts as well, I too started northwards, and took a cottage in the valley, not a mile from our old home. Ah! sad and strange seemed every

well-known spot—the wood, the mountain, and the tarn, how stern, how sombre! Not extinct, however, nor even weakened, was the power of nature; and even in my selfish heart again the chords of thankfulness and joy were stirred, and even in my sunken spirit hope seemed again to spring beneath summer airs and upon the windy hills; but chiefly when the storm was loud, I sought the once accustomed walk, and heard again the voices of my father and his son beside me, or stood in sorrow by my sister's grave.

I watched the well-known house, while my heart leaped and struggled; I longed to break my wicked oath, and glad my mother's eyes; for my wife, I had no affection, only pity, and the consciousness of the wrong I had done to her; for my son, doting, boundless love. I had seen the little curly-headed fellow within the garden afar off, but Lucy was with him, and I dared not meet her gaze, nor trust even in such disguise as mine to escape her recognition. One day, however, Charley—named after his uncle—not, alas! his father—climbed the hill in front alone. I had a little telescope carried about at all times for such an occasion, and coming up with him, offered it to the boy to look through. How tenderly I altered it to suit his sight, how lovingly I watched his delighted gestures! No kiss was ever half so sweet as that which I imprinted upon his open brow. A long, long talk I had with him, but took care to put no questions yet. I shewed him the house I lived at, told him to ask leave to visit me; and finally, when voices called him from below, I won his heart by making him a present of the telescope. That evening, as I had expected, Mrs Branksome was 'happy to have the pleasure of Mr Eugene Lecroix's company at tea.' Mother, and wife, and son, I was to meet that night as three utter strangers!

My way lay through the church-yard: a guilty, selfish wretch I felt myself to have been and to be; the steady, silent stars scarcely looked upon a being more humbled and more hateful to himself than I. Now I had reached mid-manhood, and left all my life behind me barren of a friend, fertile in despisers, or at best in commiserators, and dark on every hand with evil deeds; before me, nothingness; in four years' time, leave to reassume my former name, to be branded as an impostor, or hated as a heartless villain! What money could purchase, indeed, for me it had purchased: I had travelled over half Europe with four horses; I had drunk of the cup of pleasure even to excess—the relish was gone; I had gloated over the beauties of painting and sculpture till I had surfeited of both; scenery itself—save that of my native Shardale—had lost much of its enchantment; although, too, my constitution had hitherto held out during a course of life whereto I was driven rather than attracted, I had not the strength of my youth.

Down the gravel-walk, and underneath the sycamore, and new at the little porch where hangs the red May-rose my sister trained, and I can hear two well-known voices from the sitting-room within, and a young child's laughter; and another voice I hear that is unrecognised, nor yet altogether strange: now in the tiny hall; and now, great Heaven! at home once more.

Is this old lady, then, who shakes my hand so warmly, my dear mother? How gray she is! what sadness sits in her mild eyes, and reigns over her quiet smile!—I should not know her, save for those sweet tones. My wife—more beautiful than ever, flushed and happy, with our boy beside her, and a man, who is her lover—there is no deceiving me—on the other side, who is yes—it is Lacy, my old college friend.

'Telescope'—'kindness'—'quite ashamed'—I do not hear what they are saying rightly, but 'little Charley' grates upon my ear, and I answer curtly; and then the agony of commonplace, when the heart is full and the brain burns, for hours.

The boy is my companion daily. Lacy and she have

other things to attend to and to talk of; but they treat him well, I see, or it were worse for them. Shall I let this marriage be, and suffer my wife to sin in the eyes of the law, and make my own child's mother an adulteress? or shall I blast her happiness, and break my oath, and ruin all, to call my son my own? His father, as he tells me, never saw his face, but died ere he was born; Lacy, it seems, knows the doubt that still exists; but there are so many years elapsed, and no trace has been discovered of Mr Branksome's existence, he has persuaded her to have no doubts at all.

'Cause or impediment, as ye shall answer at the last dreadful day of account!' was rung, was tolled rather, in my ears through day and night: my state of hesitation and perplexity was awful; but the terror of the matter with me was in its reference to the boy. A few days ere the wedding, I took a sudden resolution, and posted up to London: my mind was made up to give back the relics of my fortune to his lordship, and to entreat his leave to reveal myself—to do so, at all events, with or without his leave. 'Too ill to be seen to-day; but Mr Branksome, if it was he, should be admitted to-morrow,' was my answer in Grosvenor Square. To-morrow! Scant time there would be, then, to get back to Shardale; but ordering a chaise to be in readiness at a moment's notice, I called again next day at the hour specified. The house was filled with people; the square before it, paved thick with straw, was thronged with gaping crowds; the great lord had but just expired—he, the arbiter of my destinies, the ruler of my being, had himself been forced to own a master. I was released, at length, from that bad vow.

I grew frantic as we flew towards Westmoreland; I writhed and cursed as each fresh calamity occurred: the traces broke—a wheeler fell dead-lame—the boys I had bribed to gallop madly got drunk, and galloped madly in the wrong direction. When I reached Kendal, it was past mid-noon of the marriage-day. . . . . Weeks of raging fever at the inn; death staring in my painted, lying face, putting its cold hand close beside my heart, and yet, when I considered the life that otherwise must be, not horrible, not even unwelcome. As for life beyond the grave, the thought of it was not so fearful as might seem; I had begun to consider myself 'possessed'—unaccountable for those dreadful feelings, and the acts their consequences, that had drawn misery upon so many, and that had yet, perhaps, much more to draw. I was become a fatalist. I do not even now think that it was at any time in my power to overcome my lassitude of affection, the fatigues and wearisomeness of love.

I went abroad as soon as I was able to move, and never saw the shores of England till six months ago. I dared not look upon my boy again through all that time—the boy that paid the debt of love to both his parents over and over again to her alone—the boy whom every year would help to understand more fully, if it ever was revealed, his father's sin, his innocent mother's shame. I thank Heaven that he left this earth without that bitter knowledge—that he died holding my hand in his, and thanking me for a friend's love—the love, his mother added, 'that would ever be a bond between her heart and mine!'

It was in Rome that I next met those three whom I had so deeply wronged. Her husband—he whom the world called such—came to winter there—to die there, in the last stage of a decline: a sun-stroke killed my boy; he was struck down, but lived three April-days—every hour, every minute of which is written in my inmost heart—a sorrow, yet a solace, till it beats no more.

It may be that these words may meet her eyes whom I have used so cruelly, for whose sake partly, too, I have so cruelly suffered: my love for her dear child 'will ever be a bond between our hearts,' she said. Mother! I wonder would that sadness leave your brow,

or broaden rather, had you back your son? Besides you two, there are no beings on earth, save Ellen Newby, whose right hands I would care to clasp again. 'Blessed are the merciful: for they shall obtain mercy.' Fare you well!

#### THE SMALL END OF THE WEDGE.

THERE is a subject which often occupies the attention of thoughtful men in this country, setting them on speculation whether or not the future may bring forth a cure for certain social inconveniences. This subject has reference to the relations existing between the employer and the employed. We see, from time to time, wranglings and unseemly disputes between those who have money to give for labour, and those who are willing to give labour for money. We see, and hear, and read about 'strikes' and 'lock-outs.' We are told of masters being tyrants and slave-drivers; that they 'grind the faces of the poor;' that they would pinch wages down to the starving-point; that they will themselves combine to strengthen the claims of capital, while disapproving any combination among their 'hands' for the protection of labour; that the masters are the natural enemies of the work-people; that parliament ought to throw a shield of protection around the workers, to enable them to fight the battle of labour against capital.

Why is all this? Is there anything in the nature of honest and intelligent industry which renders such miserable disputes unavoidable? Political economists claim to have settled the question by referring to the well-known law of the dependence of wages on supply and demand in labour. They say that if 500 men offer to do the work which 400 would accomplish, the competition among these men will bring down wages, without any reference to the kindness or unkindness of any particular employer, or of employers generally; and that, on the other hand, if many masters are looking out for 'hands' at the same time, the desire of obtaining labour will raise the wages, without any improvement in the technical skill or the moral characteristics of the men. All this may be true; but still there seems something else wanting—or perhaps many somethings. It is an unhealthy state of things when masters and men deem their respective classes antagonistic the one to the other. Such does not seem to be the case in the United States; owing, probably, to the vast field for exertion in a comparatively new country. It would be sad, however, to think, that because ours is an old country, there must necessarily be these heart-burnings. Many deep-thinking and far-seeing men, among whom is Mr Mill, are of opinion that some kind of partnership might be profitably established between those who do the work and those who pay for the work being done; that something better might be done than simply paying a man for an hour's or a day's work, without exciting any interest in his mind in the welfare of his employer; that a workman ought, by some arrangement or other, to have an incentive to doing his work more quickly, more skillfully, less wastefully, more conscientiously, than before.

Various matters bearing on this subject have been so frequently treated in the first and second series of the Journal, that our readers can be at no loss to understand the general tendency of the question. We take it up again—not with a view to the exposition of any principles—but in reference to a remarkable and valuable experiment which is now being made: an experiment, the success of which may possibly have much influence on many departments of labour.

The London and North-western Railway Company—the most gigantic purely commercial corporation in the world—are trying to what extent they can treat their engine-drivers as independent tradesmen instead of servants. They wish to see whether the Company

can gain by some arrangement which shall also be a gain to the employed; and whether a third party, the terrible 'public,' can gain at the same time. If all this can be done, then perhaps we shall have inserted 'the small end of the wedge:' that social wedge which, when driven home, shall both tighten and rend—tighten the bonds which connect the men of money with the men of muscle, and rend asunder the connection between honest labour and mischievous agitators.

In order to understand the nature of the experimental attempt now being made by the great Company, it may be well to say a word or two concerning the mode of managing the locomotive stock.

Every one knows that the locomotive requires very simple meat and drink—nothing but coke and water. An untiring patient horse it is, ready to work day and night, and harmless to all except the careless or the luckless. Every locomotive, during a railway journey, is under the care of a driver, who is responsible for the safe conveyance of the train, and who has a stoker to assist him. An anxious office is this. In winter and summer, in cold and heat, in sleet, snow, rain, fog, piercing blasts, the driver must be ever watchful on his post—sedulously careful that the furnace is duly filled with fuel; that the boiler has its proper amount of water; that a certain pre-arranged speed shall be maintained; that the train shall draw up at each station at the proper time and in the proper position; and that a sharp look-out shall be kept for any possible but unforeseen obstructions on the line of rails. It is an office requiring skill, nerve, hardihood, promptness; and it is right that such labour should be well rewarded. Most of the men begin their service as stokers, and rise to the dignity of engine-drivers after a certain period; and as soon as they become drivers, they receive a gradually increasing rate of wages. The old and steady hands receive 7s. or 8s. per day, and a few special instances exceed even this rate. The coke, the oil, and the few other stores necessary for the working of the locomotive, are intrusted to the driver and his stoker; and it has for years been a constant aim on the part of the railway officials, to obtain as much working-power as possible for a given quantity of materials. We meet with frequent statements, in the half-yearly accounts of the several railway companies, respecting the attained or the hoped-for savings in locomotive-power, estimated by the number of miles which the engines run with a definite quantity of coke and other stores.

In this system, the driver has no special interest in the economy of coke or anything else. It is true that if he works economically, he will give satisfaction, and lay a claim perhaps to an increase of wages, as a trustworthy servant of the Company; but further than this, he is in no way concerned with the profitableness, or otherwise, of the system whereon the locomotive service of the Company is established. If he has more than an average knowledge of the phenomena of high-pressure steam, and can make a pound of coke produce more working-power than is customary, the Company alone reap the benefit.

Now, the step which has just been taken—evidently an experimental one—by the London and North-western Company, touches at once on this very important matter. The question virtually put is this—Will an engine-driver become more careful and skilful, if it be agreed that he shall have a pecuniary interest in any benefits resulting from his care and skill? The experience of everyday-life would lead one to say pretty positively that such would be the case; but nothing less than full and ample experience would establish the affirmative of the proposition in any particular case. Who it was that first suggested the plan, and how the basis of calculation was established, we do not know; but it appears, from a correspondence which has lately appeared in the public journals, that

in the month of February last one engine-driver, an old and trusted hand, took a contract for working a locomotive; in March, another took a similar contract; in April, two more; and in May, twenty-six more. These men became in effect small masters, instead of servants, under an arrangement which we will endeavour to describe.

The engine-driver takes a contract to convey a particular train every day, or two or three trains a day. His work is definite. He is not to be called off, to drive an engine hither and thither at the behests of the superintendent; he undertakes to do an amount of work, the limitation of which is defined and exact; and he can tell beforehand, barring unforeseen circumstances, where he will be at any particular hour, and at what time he will be free to wend his steps homeward. The Company's offer to him is—'If you will conduct these trains daily in safety, we will pay you so much per mile per train; we will sell you coke, oil, and grease, at prime cost; we will do all repairs to the locomotive requiring shop-facilities, but any slight repairs which can be done on the road, must be effected at your expense: as we shall pay you the same sum whether you use much or little coke, it will be to your interest to economise your stores as much as possible, consistently with the due performance of the work intrusted to you.' This is virtually the offer made; and the engine-driver applies his acquired knowledge to the determination of the question, whether or not the terms are likely to be favourable to him. It is a question of honest bargain between the two parties. There is this advantage attending such a system, that the clever man has a brightened prospect before him; and not merely the clever, but the sober and observant man. Every pound of coke he can save by the exercise of his skill and steadiness, is so much clear gain to him while his contract lasts. Lazy and incompetent men always seek for an equalisation of wages, and always prefer day-work to piece-work; it is they who are chiefly made the tools of noisy agitators in times of 'strike.' The intelligent and assiduous man has an incentive to a system in which he can meet with some kind of reward or acknowledgment for his superior services. In this respect the contract-system—commenced in the railway world as above described—bears some analogy to the 'tribute' system among the Cornish miners, in which the miners undertake to bring the ore to the surface, and break it into small pieces, for a percentage on the value of the copper or tin contained in the ore. The analogy is limited, for other elements enter into the Cornish system; but we mention it on this account—that under both systems an intelligent and clever man has an opportunity to benefit by his talents more decidedly than if he were a mere day-worker.

We need not stop to mention the precise sum contracted to be paid per mile per train, nor why it is that a goods-train requires a higher rate than a passenger-train. Nor need we dwell upon the circumstance which caused publicity to be given to this remarkable system—a temporary disagreement between some of the drivers and the locomotive superintendent on a matter relating to wages. We have so strong an impression that there is a soundness of principle at the bottom of this new system, that we are unwilling to entangle it with any mere local or temporary circumstances.

Now for the results. There are three parties interested in the matter—the Company, the engine-driver, and the public. If the Company can have the work done more cheaply than before, and their locomotives maintained in an efficient state—if the engine-driver finds that he can earn more than he did at daily wages—if the public are carried more punctually and more safely—all parties would, mentally, if not physically, throw up their hats and rejoice. Mr M'Connell, loco-

motive superintendent on the southern division of the London and North-western Railway, has been the means of giving the contract-system a trial; and he has lately given publicity to a Report from Mr Forsyth, chief-foreman at Wolverton depot. He requested Mr Forsyth to report on the result of four months' experience of the new system. Mr Forsyth's statements are so remarkable and important, that it will be well to give an abstract of them.

First, as regards the engine-drivers. It has been found, at the end of each monthly contract, that there has been less coke, less oil, and less grease used than under the old system; the driver is benefited by the saving, and he takes care of every pound or pint of stores. By the terms of his contract, he is guaranteed against loss, while he may make the gain as much as his skill and care enable him to do. Mr Forsyth gives the balance-sheet of one of the men, and shews it to be much more favourable to the driver than under the day-work system; and he observes: 'Perhaps the greatest advantage of the system would be, that a driver contracting for a particular train would have regularly recurring intervals of rest and labour, and thereby be much better fitted to do his duty to himself, the public, and his employers, than he now is while obtaining irregular intervals of rest and labour, involved in the present system of working.' In another part of his Report he says: 'If the contract-system be generally introduced, I believe that . . . the drivers will become in every respect a better class of men; that they will make better use of their intervals between trips, go to bed at proper time, and make better use of their increased earnings.'

Secondly, as regards the Company. It is the engine-driver's interest to keep the engine in a highly effective state, in order that as few repairs as possible may be needed, except the larger occasional repairs which must be done at the engine-shops, and which are paid for by the Company. This efficient state is, in itself, a means of preserving the locomotive stock of the Company, and thereby benefiting the shareholders. 'The greatest proportion of repairs required under the day-work system,' says Mr Forsyth, 'can, without doubt, be traced to neglect alone, and which would in most part be entirely removed by the care required under and inseparable from the contract-system. . . . Under the contract-system, there would be no dirty boilers; no rapidly worn, burnt, or burst tubes; no burnt and exploded fire-boxes; no cut-up pistons; no bad journals, involving risk of broken axles, and waste of drivers' oil, and tallow, and fuel, from increased friction.' Mr Forsyth further states, that additional work could be done with the present stock of engines, and greater earnings worked for, without increasing the capital for additional locomotive-plant; and in summing up all the consequences to the Company, he says: 'I am satisfied that upon this division alone—the portion of the North-western system which lies southward of Birmingham—considering punctuality, freedom from accidents, improved condition of drivers and of engines, reduced cost of working and of repairs—which would at the same time be better done under the contract-system—it would benefit the Company between L.35,000 and L.45,000 per annum, would increase the earnings of the drivers, and tend to secure the public safety.' In respect to the Company's saving, Mr Forsyth offers a significant guarantee of the sincerity at least of his opinions, in expressing a willingness to accept a percentage on these savings in lieu of any future increase in his own salary. In an able letter in the *Times*, a writer, whose opinions, under the pseudonym of 'Amicus,' attracted much attention during the engineers' strike a year or two ago, estimates that if the contract-system were adopted in respect to all the locomotive-working in the kingdom, the companies collectively would save not less than L.700,000 per annum, while the drivers

would receive higher remuneration than at present. A bright prospect, truly—if it be not too bright to be true.

Thirdly, as regards the public. The Company, under the contract, tie down the driver rigidly in respect to time: he has to pay a fine for every *minute* of delay clearly traceable to himself; and Mr Forayth states that, as a consequence of this rule, the trains driven by contract are more punctual than those driven by day-work. If this be so, the public unquestionably gain. Then, in respect to accidents, the following opinion—coming as it does from one who has had so much experience in railway locomotion—is sufficiently noteworthy: 'I am one of those who believe, from the more than twenty years' experience I have had, that, with proper care, nearly all railway accidents can be prevented; and that nothing will tend more towards that most desirable state of things, than a careful application of the contract-system. In a great many so-called accidents which it has been my duty to investigate, I am convinced that almost every one of them could be traced to a cause which might have been prevented by care and vigilance on the part of the driver.'

If all this really be so—if all parties be benefited by a system which calls forth the care and intelligence of the engine-drivers—is not this the beginning of something that may be important by and by, both in itself and as an example? May it not be the Small End of the Wedge?

### THE GRIZZLY BEAR, AND AN ADVENTURE WITH ONE.

THE grizzly bear (*Ursus ferox*) is, beyond all question, the most formidable of the wild creatures inhabiting the continent of America—jaguar and cougar not excepted. Did he possess the swiftness of foot of either the lion or tiger of the Old World, he would be an assailant as dangerous as either; for he is endowed with the strength of the former, and quite equals the latter in ferocity. Fortunately, the horse outruns him; were it not so, many a human victim would be his, for he can easily overtake a man on foot. As it is, hundreds of well-authenticated stories attest the prowess of this fierce creature. There is not a 'mountain man' in America who cannot relate a string of perilous adventures about the 'grizzly bar'; and the instances are far from being few in which human life has been sacrificed in conflicts with this savage beast.

The grizzly bear is an animal of large dimensions; specimens have been killed and measured quite equal to the largest size of the polar bear, though there is much variety in the sizes of different individuals. About 500 pounds might be taken as the average weight. In shape, the grizzly bear is a much more compact animal than either the black or polar species: his ears are larger, his arms stouter, and his aspect fiercer. His teeth are sharp and strong; but that which his enemies most dread, is the armature of his paws. The paws themselves are so large, as frequently to leave in the mud a track of twelve inches in length by eight in breadth; and from the extremities of these formidable fists protrude horn-like claws full six inches long! Of course, I am speaking of individuals of the largest kind. These claws are crescent-shaped, and would be still longer, but in all cases nearly an inch is worn from their points. The animal digs up the ground in search of marmots, burrowing squirrels, and various esculent roots; and this habit accounts for the blunted condition of his claws. They are sharp enough, notwithstanding, to peel the hide from a horse or buffalo, or to drag the scalp from a hunter—a feat which has been performed by grizzly bears on more than one occasion.

The colour of this animal is most generally brownish,

with white hairs intermixed, giving that grayish or grizzled appearance—whence the trivial name, grizzly. But although this is the most common colour of the species, there are many varieties. Some are almost white, others yellowish red, and still others nearly black. The season, too, has much to do with the colour; and the pelage is finer and longer than that of the *Ursus Americanus*. The eyes are small in proportion to the size of the animal, but dark and piercing.

The geographical range of the grizzly bear is extensive. It is well known that the great chain of the Rocky Mountains commences on the shores of the Arctic Ocean, and runs southwardly through the North American continent. In these mountains, the grizzly bear is found, from their northern extremity, at least as far as that point where the Rio Grande makes its great bend towards the Gulf of Mexico. In the United States and Canada, this animal has never been seen in a wild state. This is not strange. The grizzly bear has no affinity with the forest. Previous to the settling of these territories, they were all forest-covered. The grizzly is never found under heavy timber, like his congener the black bear; and, unlike the latter, he is not a tree-climber. The black bear 'hugs' himself up a tree, and usually destroys his victim by compression. The grizzly does not possess this power, so as to enable him to ascend a tree-trunk; and for such a purpose, his huge dull claws are worse than useless. His favourite haunts are the thickets of *Corylus rubus* and *Amelanchiers*, under the shade of which he makes his lair, and upon the berries of which he partially subsists. He lives much by the banks of streams, hunting among the willows, or wanders along the steep and rugged bluffs, where scrubby pine and dwarf cedar (*Juniperus prostrata*), with its rooting branches, forms an almost impenetrable underwood. In short, the grizzly bear of America is to be met with in situations very similar to those which are the favourite haunts of the African lion, which, after all, is not so much the king of the forest as of the mountain and the open plain.

The grizzly bear is omnivorous. Fish, flesh, and fowl are eaten by him apparently with equal relish. He devours frogs, lizards, and other reptiles. He is fond of the larvæ of insects; these are often found in large quantities adhering to the under sides of decayed logs. To get at them, the grizzly bear will roll over logs of such size and weight as would try the strength of a yoke of oxen. He can 'root' like a hog, and will often plough up acres of prairie in search of the wapattoo and Indian turnip. Like the black bear, he is fond of sweets; and the wild-berries, consisting of many species of currant, gooseberry, and amelanchier (service-berry), are greedily gathered into his capacious maw.

He is too slow of foot to overtake either buck, elk, or deer, though he sometimes comes upon these creatures unawares; and he will drag the largest buffalo to the earth, if he can only get his claws upon it. Not unfrequently he robs the panther of his repast, and will drive a whole pack of wolves from the carrion they have just succeeded in killing. Several attempts have been made to raise the young grizzlies, but these have all been abortive, the animals proving anything but agreeable pets. As soon as grown to a considerable size, their natural ferocity displays itself, and their dangerous qualities usually lead to the necessity of their destruction.

For a long time the great polar bear has been the most celebrated animal of his kind; and most of the bear-adventures have related to him. Many a wondrous tale of his prowess and ferocity has been told by the whaler and arctic voyager, in which this creature figures as the hero. His fame, however, is likely to be eclipsed by his hitherto less-known congener—the grizzly. The golden line which has drawn half

the world to California, has also been the means of bringing this fierce animal more into notice; for the mountain-valleys of the Sierra Nevada are a favourite range of the species. Besides, numerous 'bear scrapes' have occurred to the migrating bands who have crossed the great plains and desert tracts that stretch from the Mississippi to the shores of the South Sea. Hundreds of stories of this animal, more or less true, have of late attained circulation through the columns of the press and the pages of the traveller, until the grizzly bear is becoming almost as much an object of interest as the elephant, the hippopotamus, or the king of beasts himself.

Speaking seriously, he is a dangerous assailant. White hunters never attack him unless when mounted and well armed; and the Indians consider the killing a grizzly bear a feat equal to the scalping of a human foe. These never attempt to hunt him, unless when a large party is together; and the hunt is, among some tribes, preceded by a feast and a bear-dance. It is often the lot of the solitary trapper to meet with this fourfooted enemy, and the encounter is rated as equal to that with two hostile Indians. From a celebrated 'mountain man,' I had the following story or stories, which I give in the rude patois of the narrator:—

'Young fellur, when you scare up a grizzly, take my advice, and gie 'im a wide berth—that is, unless yur unkimmun well mounted. Ov coorse, ef yur critter kin be depended upon, an' thur's no brush to 'tangle him, yur safe enough; as no grizzly, as ever I seed, kin catch up wi' a hoss, whar the ground's open an' clur. F'r all that, whar the timmer's clost an' brushy, an' the ground o' that sort whar a hoss mout stummel, it are allers the safest plan to let ole Eph'm slide. I've seed a grizzly pull down as good a hoss as ever tracked a parairy, whar the critter hed got bothered in a thicket. The fellur that straddled him only saved himself by hookin' on to the limb o' a tree. Twant two minnits afore this child kim up—hearin' the rumpus. I hed good sight o' the bar, an' sent a bullet—sixty to the pound—into the varmint's brain-pan, when he immediately cawalpowed over. But 'twur too late to save the hoss. He wur rubbed out. The bar had half skinned him, an' wur tarrin' at his guts! Waghi!'

Here the trapper unsheathed his clasp-knife, and having cut a 'chunk' from a plug of real 'Jee'mes's River,' stuck it into his cheek, and proceeded with his narration. 'Young fellur, I reck'n, I've seed a putty consid'able o' the grizzly bar in my time. Ef that thur chap who writes about all sorts o' varmint—Awdoo-bong, I think, they calls him—hed seed as much o' the grizzly as I hev, he mout a gin a hul book consarnin' the critter. Ef I hed a plug o' bacca for every grizzly I've rubbed out, it 'ud keep my jaws waggin' for a good twelf'month, I reck'n. Ye—es, young fellur, I've done some bar-killin'—I hev that, an' no mistakes!

'Wal, I wur a gwine to tell you o' a sarcumstance that happened to this child about two yeern ago. It wur upon the Platte, atween Chimby Rock an' 'Saramies'. I wur engaged as hunter an' guide to a carryvan o' emigrant folks that wur on thur way to Oregon. Ov coorse I allers kept ahead o' the carryvan, an' picked the place for thur camp. Wal, one arternoon I hed halted whar I seed some timmer, which ur a scarce article about Chimby Rock. This, thort I, 'il do for campin'-ground; so I got down, pulled the saddle off o' my ole mar, an' staked the critter upon the best patch o' grass that wur near, intendin' she shed hev her gut-full afore the camp-cattle kim up to bother her. I hed shot a black-tail buck, an' after kindlin' a fire, I roasted a griskin' o' him, an' ate it. Still thur wan't no sign o' the carryvan, an' arter hangin' the buck out o' reach o' the wolves, I tuk up my rifle, an' set out to rackynoiter the neighbourhood. My mar bein' some'at jaded, I let her graze away, an' went afoot; an' that, let me tell you, young fellur, ar about the most foolichest thing

you kin do upon a parairy. I wan't long afore I proved it, but I'll kum to that by'm by.

'Wal, I fust clomb a consid'able hill, that gin me a view beyont. Thur wur a good-sized parairy layin' torst the south an' west. Thur wur no trees 'ceptin' an odd cottonwood hyur an' thur on the hillside. About a mile off I seed a flock o' goats—what you, young fellur, call antelopes, though goats they ur, as sure as goats is goats. Thur wunt no kiver near them—not a stick, for the parairy wur as bar as yur hand; so I seed, at a glimp, it 'ud be no us a tryin' to approach, unless I tuk some plan to decoy the critters. I soon thort o' a dodge, an' went back to camp for my blanket, which wur a red Mackinaw. This I knew 'ud be the very thing to fool the goats with, an' I set out torst them.

'For the fust half a mile or so, I carried the blanket under my arm. Then I spread it out, an' walked behind it until I was 'ithin three or four hundred yards o' the animals. I kept my eye on 'em through a hole in the blanket. They wur a growin' scary, an' hed begun to run about in circles; so when I seed this, I knew it wur time to stop. Wal, I hunkered down, an' still keepin' the blanket spread out afore me, I hung it upon a saplin' that I had brought from the camp. I then stuck the saplin' upright in the ground; an' mind ye, young fellur, it wan't so easy to do that, for the parairy wur hard friz, an' I hed to dig a hole wi' my knife. Howsomdever, I got the thing rigged at last, an' the blanket hangin' up in front kivered my karkidge most complete. I hed nothin' more to do but wait till the goats shed come 'ithin range o' my shootin'-iron. Wal, that wan't long. As you know, young fellur, them goats is a mighty curious animal—as curious as weemen is—an' arter runnin' backward an' forrard a bit, an' tossin' up thar heads, an' sniffin' the air, one o' the fattest, a young prong-horn buck, trotted up 'ithin fifty yards. I jest squinted through the sights, an' afore that goat hed time, to wink twice, I hit him plum atween the eyes. Ov coorse he wur throwed in his tracks. Now, you'd a jumped up, an' frightened the rest away—that's what you'd a done, young fellur. But you see I knowd better. I knowd that so long 's the critters didn't see my karkidge, they wan't a gwine to mind the crack o' the gun. So I laid still, in behopes to git a wheen more o' 'em.

'As I hed calc'lated at fust, they didn't run away, an' I slipped in my charge as brisk as possible. But jest as I wur raisin' to take sight on a doe that hed got near enough, the hull gang tuk scare, an' broke off as ef a pack o' parairy wolves wur arter 'em. I wur clean puzzled at this, for I knowd I hedn't done anythin' to frighten 'em, but I wan't long afore I diskivered the cause o' thar alarm. Jest then I heerd a sniff, like the coughin' o' a glandered hoss; an' turnin' suddintly round, I spied the biggest bar it hed ever been my luck to set eyes on. He wur comin' direct torst me, an' at that minnit wan't over twenty yards from whar I lay. I knowd at a glimp he wur a grizzly!

'Tain't no use to say I wan't skeart; I wur skeart, an' mighty bad skeart, I tell ye. At fust, I thort o' jumpin' to my feet, an' makin' tracks; but a minnit o' reflexshun shewed me that 'ud be o' little use. Thur wur a half o' mile o' clur parairy on every side o' me, an' I knowd the grizzly kud catch up afore I hed made three hundred yards in any direction. I knowd, too, that ef I started, the varmint 'ud be sartin to foller. It wur plain to see the bar meant mischief; I kud tell that from the glint o' his eyes.

'Thar wan't no time to lose in thinkin' about it. The brute wur still comin' nearer; but I noticed that he wur a gwine slower an' slower, every now an' agin raisin' to his hind-feet, clawin' his nose, an' sniffin' the air. I seed that it wur the red blanket that puzzled him; an' seein' this, I crep closter behind it, an' cached

as much o' my karkidge as it 'ud kiver. When the bar hed got 'ithin about ten yards o' the spot, he kim to a full stop, an' reared up as he hed did several times, with his belly full torst me. The sight wur too much for this niggur, who never afore hed been bullied by eyther Injun or bar. 'Twur a beautiful shot, an' I kudn't help tryin' it, ef 't hed been my last; so I poked my rifle through the hole in the blanket, an' sent a bullet atween the varmint's ribs. That wur, prehaps, the foolichest an' wust shot this child ever made. Hed I not fired it, the bar mout a gone off, feard o' the blanket; but I did fire, an' my narves bein' excited, I made a bad shot. I hed ta'en sight for the heart, an' I only hit the varmint's shoulder. Ov coorse, the bar bein' now wounded, bekim savage, and cared no longer for the blanket. He roared out like a bull, tore at the place whar I hed hit him, an' then kim on as fast as his four legs 'ud carry him.

'Things looked squaly. I throwed away my empy gun, an' drew my bowie, expectin' nothin' else than a regular stand-up tussle wi' the bar. I knowd it wur no use turmin' tail now; so I braced myself up for a deaprate fight. But jest as the bar hed got 'ithin ten feet o' me, an idee suddintly kim into my head. I hed been to Santa Fé, among them yaller-hided Mexikins, whar I hed seed two or three bull-fights. I hed seed them mattydoors fling thur red cloaks over a bull's head, jest when you'd a thort they wur a gwine to be gored to pieces on the fierce critter's horns. Jest then, I remembered thur trick; an' afore the bar cud close on me, I grabbed the blanket, spreadin' it out as I tuk holt. Young fellur, that wur a blanket, an' no mistake! It wur as fine a five-point Mackinaw as ever kivered the hump-ribs o' a nor-west trader. I used to wear it Mexikin-fashion when it rained; an' in coorse, for that purpose, thur wur a hole in the middle to pass the head through. Wal, jest as the bar sprung at me, I flopped the blanket straight in his face. I seed his snout a papin' through the hole, but I seed no more; for I feelled the critter's claws touchin' me, an' I lot go. Now, thunk I, wur my time for a run. The blanket mout blin' him a leetle, an' I mout git some start. With this thort, I glid past the animal's rump, an' struck out over the parairy. The direction happened to be that that led torst the camp, half a mile off; but thur wur a tree nearer, on the side o' the hill. Ef I kud reach that, I knowd I'd be safe enuf, as the grizzly bar it don't climb. For the fust hundred yards I never looked round; then I only squinted back, runnin' all the while. I kud jest see that the bar appeared to be still a tossin' the blanket, and not fur from whar we hed parted kumpany. I thort this someat odd; but I didn't stay to see what it meant till I hed put another hundred yards atween us. Then I half turned, an' tuk a good look; an' if you believe me, my young fellur, the sight I seed thur 'ud a made a Mormon larf. Although jest one minnit afore, I wur putty nigh skeart out o' my seven senses, that sight made me larf till I wur like to bring on a colic. Thar wur the bar wi' his head right athrough the blanket. One minnit, he 'ud rear up on his hind-feet, an' then the thing hung roun' him like a Mexikin greaser. The next minnit, he 'ud be down on all-fours, an' tryin' to foller me; an' then the Mackinaw 'ud trip him up, an' over he 'ud whammel, and kick to get free—all the while routin' like a mad buffalo. Jehosophat! it wur the funniest sight this child ever seed. Wagh!

'Wal, I watched the game awhile—only a leetle while; for I knowd that ef the bar could git clur o' the rag, he mout still overtake me, an' drive me to the tree. That I didn't want, eyther, so I tuk to my heels agin, an' soon reached camp. Thur I saddled my mar, an' then rid back to git my gun, an', prehaps, to give ole Eph'm a fresh taste o' lead. When I clomb the hill agin, the bar wur still out on the parairy, an' I cud see that the blanket wur a-hanging around 'im.

Howsomever, he wur makin' off torst the hills, thinkin', maybe, he'd hed enuf o' my kumpany. I want a gwine to let 'im off so easy, for the skear he hed gin me; besides, he wur trailin' my Mackinaw along wi' 'im. So I galluped to whar my gun lay, an' havin' rammed home a ball, I then galluped arter ole grizzly. I soon overhauled him, an' he turned on me as savagerous as ever. But this time, feeling secure on the mar's back, my narves wur steadier, an' I shot the bar plum through the skull, which throwed him in his tracks, wi' the blanket wropped about 'im. But sich a blanket as that wur then—ay, sich a blanket! I never seed sich a blanket! Thur wunt a square foot o' it that wan't torn to raggles. Ah, young fellur, you don't know what it are to lose a five-point Mackinaw; no, that you don't. Cuss the bar!

## PEOPLES AND PROSPECTS OF EASTERN EUROPE.

### SECOND ARTICLE.

ONE of the most remarkable features of the history of Eastern Europe in modern times, is the tendency of old races to reappear upon the political stage, and assert their right of independent existence. Although this tendency in itself is opposed to civilisation, which labours to efface the distinctive characteristics of nations, it may be useful, if properly guided, under present circumstances. The Slavonian movement, not so far advanced as some seem to imagine, is probably destined to play an important part in remodelling the map of Europe. But the most interesting specimen of peoples who have long slept, awakening and preparing a new destiny for themselves, are, no doubt, the Greeks, the Bulgarians, the Roumans, the Servians, and the Magyars. We intend especially to direct the attention of our readers to the condition of those races which form, or have until recently formed, part of the Ottoman Empire; and may be now discerned with more or less distinctness through the breaches which are every day widening in that antique edifice, which it seems impossible to prop up, and which it will be certainly impossible to rebuild if it once comes to the ground.

There appears to be a misconception existing in the minds of many, that once the Turkish race or government is removed, there will remain only the attenuated remains of a Byzantine Empire, subservient to the designs of Russia. A more careful examination of the state and character of the peoples now inhabiting the European dominions of Turkey, will lead to a different conclusion. It is quite certain that both Bulgarians and Roumans have been to some extent Hellenised, as the popular expression goes—that is, they have been imbued with the Greek religion, and are gradually receiving instruction in Greek literature. But this is a tendency totally opposed to that according to which nationalities are endeavouring to reconstitute themselves, and not at all capable of struggling with it. We shall endeavour to shew that all that can be done by the Greek idea, has already been accomplished in so far as the Bulgarians and the Roumans are concerned. They have accepted their religion from Constantinople, as Spain and Austria have accepted theirs from Rome; and they readily learn the arts of reading and writing, and the elementary principles of knowledge, from the Greek Papas, as Western Europe received new floods of learning from the Byzantine fugitives four centuries ago. But the border provinces of European Turkey have a life of their own, of which they have recently become conscious, and are decidedly yearning for separate and independent existence. There was, it is true, something grand in the conception of a new empire starting up at once in giant proportions on the banks of the Bosphorus, and uniting under its sway all the elements of the empire that was departing. It led away many minds

who have been since forced to admit that there was one thing lacking for its realisation—the presence of an imperial race.

The Greeks are certainly not the base, miserable rabble it has been thought of late advisable to represent them to be. They have many fine qualities—are brave, generous, hospitable, and laborious. But these qualities are possessed in as eminent a degree by many other barbarous races; and unfortunately, the Greek, like the Turk, whenever he attempts to be or appear civilised, rather degenerates than otherwise. This is the true reason why most persons, even travellers, have formed a low estimate of his character. It is difficult to come in contact with the genuine raw material, the peasant, the shepherd, the stuff of which the Klefts were made, the ever-ready soldiers of an insurrection for national independence. We usually meet with persons engaged in commerce or in political intrigue, and find an extraordinary predominance of one faculty—cunning—over all other faculties, and often a very slight regard for the ordinary rules of fair dealing. Throughout the Levant, there is a feeling, which may be a prejudice, though it is hard to believe in a prejudice entertained indiscriminately by Turks and English, by Italians and Germans and French, that it is better not to have to do, in the way of business, with the Greeks. Some of their warm friends say, that this is merely a tribute to their superior cleverness; but it is perhaps more philosophical to admit a fact so generally stated, and endeavour to account for it. The truth probably is, that during long centuries of oppression, the Greeks, like the Jews in the middle ages, were forced, by their unfortunate position of servitude, to acquire the mental habits usual in subject peoples, and have not yet been able to shake them off. This is an excuse which it would be very unfair to suppress; but we have at the same time an explanation of the extreme improbability that any Greek empire, properly so called, can at present be established. Indeed, we believe that this idea was exclusively the product of the present university of Athens, where men of elegant minds suffered themselves to wander in speculative mazes regardless of all practical application. A more serious plan was that of a Christian empire, under a king appointed by Europe, with machinery that would have allowed each race to make its wants and wishes felt—the honest conservative Bulgarians in the centre forming the ballast by which the somewhat Frenchified Roumans, inclined to novelty and adventure, in the north, and the rather unscrupulous Greeks, keen in the pursuit of money, to the south, were to be steadied. Perhaps, however, it would have been wiser to wait until all the tendencies to disorganisation and reorganisation, now at work—some manifestly, others more obscurely—were perfectly well known. It is not our province to prophesy; but an attentive examination of the aspect of Eastern Europe seems to us to render it probable, that at no very distant day, the experiment of a federation of states—perhaps not free, in our sense of the word, but certainly not despotic—with Servia, a new Switzerland, in the centre, will be tried.

We have hinted that we do not attach the same importance as do some to the Pan Slavonic movement—at any rate, as likely to lead to events commensurate to or in accordance with its name. To calculate the orbit in which so vast a body as Russia is ultimately to move, would be a difficult task; but it may safely be said, that the fortunes of Austria and the German powers generally, must be modified by a theory which seems to have been invented for the very purpose of destroying Teutonic influence, and has been eagerly taken up by those who have suffered under Prussian or Austrian rule. To give an idea of the virulence of feeling that exists, the writer of this paper may mention that he was looking, with some Poles, at a map of

Europe, and listening to their projects of reconstruction. Of course, they reproduced the kingdom of Poland with its widest frontiers. But what was to be done with the colonies of industrious Germans which have been scattered here and there, forming a sober urban population, amidst an excitable mass of agriculturists? Western politicians would have accepted with joy this excellent element. The answer of the Poles was, that 'all Germans must be killed, or transported to Kamtschatka!'

This was but a violent expression of the tendency so hostile to civilisation, which exists in nearly all the families that inhabit the east of Europe. They all, with more or less candour, aim at exclusive possession, or, at any rate, exclusive dominion over the land in which they live. The only exception is, perhaps, the not very gracious concessions made by the Magyars to their Slavonian brethren. We have heard Greeks, warming into sincerity, admit that they believe in their right to govern wherever even the outposts of their colonies exist; contemplate the extirpation of the Turks; and promise to treat the subject races of the Bulgarians, Roumans, Servians, Albanians, Bosniaks, and so forth, with due regard to justice, so long as they did not claim imperial privileges. The Bulgarians, on the other hand, hate the Greeks, partly from some unknown religious causes, partly because they know them chiefly in their commercial character, in which, as we have said, the presumed descendants of the ancient Hellenes are nowhere very favourably known. The peasant of the Danube, who, though he has adopted the Slavonic language, remembers his Tatar origin, dreams, as he sits by his mighty river, of a time when he, too, may aspire again to dominion over that degenerate crew which his race, ever since its establishment in Europe, has never seen but in servitude. He has heard of independent Greece, but does not understand what he hears. Independence under a foreign prince scarcely conveys any idea to his mind. He, too, is independent, he thinks, in that sense. He is waiting for some enthusiastic shepherd—perhaps some bandit from the recesses of the Balkan—a man of his own blood and language—to come forward and head a truly national struggle—a Kossuth, a Shaml, an Abd-el-Kader—or rather a new Lakhana, the king-adventurer of the last years of their own independent history.

No Eastern people can comprehend our idea of a state. It is too complicated for them—the product of a stage of civilisation to which they will probably not attain for some time to come. It is the want of power to receive this idea that has checked the progress of the Greeks, who, strangely enough, study their ancient literature without imbibing any of the lessons of civil government it contains. All their political notions are Oriental. Now, the Oriental idea of a state is the authority of one man, controlled more or less by public opinion. Few of what are called Asiatic despotisms are strictly autocratic. The Greeks, and all their Christian brethren, are disposed, like their Moslem conquerors, to look upon a state as a natural being essentially connected with religion. As the Turks cannot be made to understand an authority existing by its own right, or delegated by races of different faith, so neither can their subjects. This is an important fact to notice. The Turk is, in one respect, a step in advance: he fraternises willingly with the Bosniak or the Albanian professing the same creed. The Greeks, the Bulgarians, and the Servians are intolerant also in matters of blood, and have not as yet been able to conceive anything beyond a Greek, a Bulgarian, or Servian state.

It is this divided condition of the races which, in obedience to a mysterious law, are rapidly rising into notice, that has enabled Russia to claim and exercise so great an influence over their fortunes. If similarity of religion has not created sympathy between

neighbouring nations, it has induced them all to look with hope, not unmixed, perhaps, with fear, to a distant power. Strictly speaking, the Christians of Turkey find their *beau-ideal* of government already existing in Russia, and are disposed, at first sight, to consent to absorption. A nearer view, however, repels them. They miss one of the essential details of their organisation—the primary assemblies by which the people can convey to the head of the government their will and their desires. These assemblies they already possess. They appear to be rather of Slavonian than Greek origin, but may best be studied in the provinces of Thessaly and Macedonia. The Turks always made it a rule—if they were not rather governed by chance—to disturb the existing state of things in the countries they conquered only in so far as was necessary to the establishment of their own authority. Everywhere we find, therefore, the villages and boroughs, both of Greeks and Bulgarians, supplied with a kind of municipal government, in which all local interests are discussed. Traces of the same institution are even found in Russia, where it existed in full force until the time of Peter the Great. The existence of the forms enables the partisans of the northern empire to appeal most effectually to the prejudices of the Christian inhabitants of Turkey; but, as we have said, a closer inspection seems to alarm them; and they retire within themselves to meditate on the development of their own particular nationality. The appeals made, however, serve to stimulate their religious bigotry; and the time seems approaching when, no matter under what leader, they may be led to join in an unreasoning crusade against the followers of the Crescent. The question, however, is, whether a unanimous impulse will lead to any political result corresponding in character.

#### THE CABARET OF THE BREAK OF DAY.

EVERY visitor to Paris must have observed the time-worn summit of the tower of St Jacques de la Boucherie rising darkly near the Place du Châtelet, as if in solemn contrast with the gilded statue of Victory upon the pillared fountain in the midst. This tower is one of the finest specimens of the declining style of pointed architecture in France, and is the only remaining portion of the church of St Jacques de la Boucherie, which once occupied the entire area of the cloth-market at its base, and which was demolished during the Revolution.

Close by this old church—so close, indeed, as to lie beneath the very shadow of its tower in the evening sunset—there stood, about the middle of the last century, a mean *cabaret*, called Le Point du Jour (The Break of Day). It was a small, ill-lighted, dirty place enough, with sanded floors, and benches stained with liquors, and tables cut all over with the names of revellers. An old man, gray, withered, and cunning-eyed, served at the bar, and a young boy waited on the customers in the parlour.

Le Point du Jour was, however, a well-known cabaret and a prosperous. M. Perpignan's cellar was famous for old Macon wine, and his parlour for being the daily resort of a celebrated landscape-painter, named Simon Mathurin Lantara, an artist whose genius trod closely upon the footsteps of Claude Lorraine. Like that great painter, he had taken Nature alone for his master and his model; like too many of those who are indebted for their success solely to the spontaneous promptings of native talent, he was indolent, careless, and self-indulgent. Tainted by the sceptical philosophy of the Voltairian school, gifted with a fund of wit and repartee, endued with a natural taste for letters, an enthusiastic lover of beauty in all its phases, generous, thoughtless, affectionate, and kind-hearted, Lantara only needed to have lived a century later to have been

a happy, a prosperous, a respectable man. As it was, the age ruined him—the brilliant, licentious age of Louis XV. At the same time, it must be confessed, that M. Perpignan's old Macon wine bore some share in the errors of the landscape-painter. That old Macon was his fate—his bad angel. For its sake only, he frequented a low wine-shop such as this in the Place St Jacques de la Boucherie; for its sake, mingled constantly with the uneducated crowd of fourth-class actors, strolling musicians, ruined gamblers, and sign-painters, which daily filled the back-parlour of Le Point du Jour; for its sake, sank lower and lower every year in poverty, intemperance, and degradation. Yet, despite the inferior natures by which he was surrounded; despite the atmosphere of low debauchery wherein he moved and breathed; despite the fumes of wine which obscured his better sense, and robbed his hand too often of its steadiness, Lantara was inspired with the true power of a master. To him, the flushing skies and dewy pastures were holy, yet familiar things. Looking upon his canvas, you seemed to see the very freshness of the past shower—to feel the summer wind blowing through the mountain-pass, and shaking the leaves of the forest. Above all, he delighted to represent the fleecy vapours of 'incense-breathing morn,' and those rare sun-mists in which our English Turner has since proved so great. Some of his crayon-sketches, which are yet preserved in the Musée des Dessins, and in various private collections, are wonderfully bold and effective. The materials, too, are sufficiently simple; the whole thing consisting merely of careless touches in black and white crayons on gray or blue paper. Upon the latter, he drew some moonlight views of a magical, dreamy loveliness altogether unique.

But the cabaret spoiled all his prosperity, and fatally interrupted his labours. The back-parlour of Le Point du Jour was Lantara's *atelier*. There stood a table, called 'Lantara's table'; it was stained all over with drops of oil-paint, and heaped at one end with boxes of colour, palettes, brushes, maul-sticks, and old frames. There he sat amid a throng of boozing companions and low admirers—there, inspired by draughts of the old Macon, he dealt the flashes of his wit upon unworthy ears—there he reproduced the sullied bloom of earth and sky in his latest *chefs-d'œuvre*. And to this wretched place all those who desired to purchase his paintings were obliged to come. It will readily be seen how odious such a pilgrimage must have been to the rich and fastidious noblemen of the court of Louis Quinze, and what wealth and honour Lantara must have necessarily lost in the parlour of Le Point du Jour. Here, however, some patrons condescended to seek him; and amongst others, His Grace the Duke de Richelieu.

Carried to the door in a sedan-chair, and attended by servants on foot in gorgeous liveries, the duke made his way, with an air of supreme disgust, into the little noisome parlour at the back. 'Parbleu!' said he with a shrug and a grimace, 'you are a droll fellow, thus to establish your atelier at a wine-shop, in the quarter of St Jacques de la Boucherie! Do you know, Lantara, one must love the arts to excess, before one can summon courage to wade through the sand and dirt of this parlour, for the sake of a picture.'

'Merit is modest,' replied the painter with a merry glance; 'and it is for the noble and enterprising to seek it in the shade. But what can I do in the service of monseigneur? Does he wish for the sacred or the profane? for silver moonlight, for purple sunset, for a rippling lake? Or would he prefer the vestal vapours of the morn? With twenty-four sous' worth of paint, I can supply him.'

'I wish,' replied Richelieu, 'for a landscape such as I will describe to you. It is to fill a particular place in my gallery. You must depict a little chapel and a humble manse, all overgrown with the creeping ivy.'

Let the country around be wild and uncultivated—give a distant forest, a mountain-stream, some rocks: in short, I want something simple, yet savage; and enveloped, moreover, in one of your vaporous hazes. I say nothing to you about price—the Duke de Richelieu never bargains.' The painter bowed low over the nobleman's extended hand, and his Grace went forth from the cabaret, leaving behind him a strong odour of musk.

Lantara applied himself vigorously to his task; but, like the immortal Claude, he could never paint the human figure; and so the duke's picture contained not a single one. It was completed in the short space of one month, and it was a marvel of romantic scenery, of mist, of finish. The Duke de Richelieu came back in about five weeks, and found Lantara stretched idly upon a bench in the back-parlour of the cabaret, drinking and smoking with two or three others.

'Is this the way to work?' asked the duke, with that air of *bonhomie* in which it was his custom to convey a reproach. 'What has become of my picture?'

'*Finis coronat opus*,' said the painter. 'Behold it finished! It is not my place, monseigneur, to vaunt my own skill; but I think you must confess that it is a master-piece.'

'It is very beautiful, Lantara,' replied his Grace, inspecting the canvas through his eye-glass; 'but there is one thing in which I am disappointed.'

'Indeed! and what may that be?'

'I am amazed at the freshness of the colours, at the *vérisemblance* of the scene, at the purity of touch—but you have quite forgotten the figures. I see the forest, the valley, the chapel, the manse—but not a human figure!'

'Monseigneur,' replied the artist, '*all the people are at mass*.'

'At mass, are they?' replied the duke. 'Eh bien! I will pay for the picture when they come out.'

'If that be all, I will make them come out directly, monseigneur.' And Lantara, snatching up a pencil, sketched a grotesque figure half hidden among the trees of the forest.

'There,' he said, when he had finished; 'I have soon satisfied you.'

'But what you have done is nothing! It is a bluish, not an improvement. Monsieur, your jest is in bad taste, and very ill-timed.' And the duke was really angry.

'But, monseigneur,' urged Lantara, 'when the mass was over, the good people hastened home. *They are all gone in*. The proof of what I say is, that this peasant, having lost his way in the forest, is so ashamed of being seen, that he is hiding himself from every eye. It would be scarcely decent or reverential to be strolling out at such a time.' It is almost unnecessary to add, that Richelieu, quite disarmed by this reply, paid instantly for the picture, which was nothing less than a *chef-d'œuvre*.

The money was soon spent in the back-parlour of Le Point du Jour; for Lantara, who, like most artists, was extremely improvident, would play the host to every comer, and was soon more deeply in debt than he had been before.

Shortly after this, a circumstance occurred which threatened for awhile to deprive M. Perpignan of his customer. Lantara rented a miserable garret at the top of an old house, behind the church of St Jacques de la Boucherie—a place with broken windows and an open chimney, and furnished with nothing but a mattress, a chair, a lame table, and a caged lapwing; which last was the sole charm and treasure of his comfortless home. One night, the painter, who had been indulging more than usual in the old Macon, was so intoxicated that he could not find his lodging; so he staggered up the steps, and fell fast asleep under the porch of St Jacques. Here he was awakened by the

sunshine of the next morning. He rose—the cabaret was just facing him—he crossed over, and went in. It was gray evening before he came out again; and this time, although he was sober compared with the night before, his brain was heated, and his step far from steady. He reached his own door—he ascended the staircase—he entered his garret. Alas! in the two days' revel he had forgotten his poor lapwing. There it lay at the bottom of the cage, dead for want of food and water.

The bird had been his only tie, his only affection in the world! Lantara, in despair, would have thrown himself from the window, but that was prevented by a fellow-lodger, an old fiddler, who had been attracted by his cries of grief. Subdued by this man's persuasions, Lantara passed from his first stage of feverish excitement to a condition of listless melancholy. For three days and nights, he hung over the body of his little favourite, smoothing its feathers with his hand, and calling it by the most endearing names. But it was quite cold and dead, and could return his love and respond to his call no longer. 'Alas!' sobbed the painter, 'it is I who have murdered thee, my pretty bird! I have murdered thee, and there is no law to punish me, monster that I am! Thou art dead—thou canst not reproach me! But it is the wine-shop, the wine-shop that has been the cause of thy death; and I swear upon thy corpse, never again to set foot upon the threshold of Le Point du Jour!'

Lantara kept his word—for eight days. The oaths of a drunkard are as readily forgotten as those of a lover; besides, the memory of the dead fades rapidly away. Lantara buried his bird in a field near Paris; and he was very soon to be found as constantly, perhaps more constantly than before, in the parlour of Le Point du Jour. However, he could not endure to stay in his old lodging—he could not sleep in the room which had witnessed the death of his poor lapwing. So he removed to a small room in the Rue du Chantre, which was in every respect neater and more pleasant than the last. The proprietor of this house was a clever, calculating man. He knew his lodger's weakness in favour of old wine and good dinners, and he resolved to profit thereby. Thus, for a fat capon, a salad, some tarts, and a bottle of the old Macon from M. Perpignan, the landlord secured a collection of valuable sketches, for which, at the death of the poor artist, he received considerable sums.

But in the meantime Lantara was getting more and more deeply into debt at the bar of the cabaret, and every inhabitant of the quartier St Jacques de la Boucherie might read the amount of his liabilities scored up close beside the door. This public announcement grieved the painter beyond measure; for with the habits, he had not lost the pride of a gentleman. He proposed to paint two pictures for M. Perpignan, in order to defray the debt. To this offer, the marchand des vins reluctantly consented. Night and Morning were the subjects chosen for illustration; and Lantara set earnestly to work. But such was the luckless painter's penchant for the old Macon, that, long before the pictures were half finished, the amount of his debt was more than trebled, and his score occupied three large slates behind the bar.

Lantara was as well known in the quartier as the tower of the church whence its name was derived, and his presence alone brought plenty of custom to Le Point du Jour. When he used the parlour for his atelier, the place came to be regarded by the inhabitants as a kind of free exhibition, and they used not only to crowd round him, watching every movement of the pencil, but would even assemble outside and peep in through the windows. It was a frequent custom with these visitors to treat the artist with a friendly glass, in return for the amusement his labours afforded them; and from this circumstance Lantara conceived a project

for liquidating his score. This was how he proceeded:—In the first place, he purchased a large canvas whereon he sketched the ruins of an old château, half-way up the side of a rugged steep, and in the background a valley all luminous with the phosphorescent vapours of morning. This picture attracted a large number of spectators, amongst whom were several generous enough to offer Lantara sundry glasses of his favourite wine. But he had one reply for all.

'I have given up wine,' said the painter, 'for Monsieur Perpignan has just imported a supply of capital gin from Schiedam, which I infinitely prefer.'

'Chacun à son goût,' replied they, with evident surprise. 'You shall have the gin, Monsieur Lantara, and we will drink the old Macon.' The Schiedam liquor was, in fact, remarkably good, and that day the painter drank some dozens of *petits verres*. The next morning he rose very early, and made his way to the cabaret, at an hour so unwonted that M. Perpignan could not forbear expressing his astonishment.

'What! up already, Monsieur Lantara?' exclaimed he. 'Surely something has gone wrong. Has anything happened?'

'Nothing. But I wanted to speak to you before the customers assemble, for I have something particular to say.'

'What may that be?'

'I owe you money, Monsieur Perpignan.'

'Parbleu! I know that well enough. Why, here are three slates filled with your scores! Thirty pâtés—fourteen dozen of the old Macon—twenty-six capons—seventeen salads with'—

'Do not trouble yourself to recount the contents of the three slates, Monsieur Perpignan,' interrupted Lantara, somewhat angrily. 'I want to be out of your debt, and I am about to propose an idea to you.'

'I want money,' grumbled the marchand; 'I don't want ideas.'

'But the idea shall be worth money, and that is the same thing. Now listen attentively, and follow my instructions to the letter. I told all the people yesterday that I had ceased to care for anything but the gin of Schiedam. There was not a word of truth in what I said, mon ami. The old Macon still has, and ever will have, my preference. Send me a bottle at once, that I may prove it to you; and put it down to my score.' The wine was brought; he drank a tumblerful at a draught, and then went on: 'And could you for one instant believe that I really preferred the pale Dutch liquid to the red old Burgundy? Alas! no—I only said so; but I said it with a purpose. Attendez! When the customers offer me a glass of the gin, Monsieur Perpignan, serve up a glass of pure water, and thus you can set the price against my debt, and wipe away that horrible list which fills me with shame and anger all day long. Farewell, my old favourite!' he cried with a deep sigh, as he poured the last drop into his glass. 'Henceforth, I must taste nothing but water—truly, it is a punishment I have deserved!' And the painter that day drank no less than twenty-five *petits verres* of cold water, in expiation of his sins, and went home at night in a state of unusual sobriety, singing with a melancholy voice the refrain of a popular drinking-song:

Tous les méchants sont buveurs d'eau—  
C'est bien prouvé par le déluge!

For several months, Lantara heroically persevered in this course, and the slates in time offended his pride no more. But the immoderate use of cold water, to which his pride or probity had urged the painter, produced the most baleful effects upon his constitution; and before half a year had elapsed, he became so ill that it was found necessary to remove him to the neighbouring hospital of La Charité, in the Rue Jacob.

Here, although his case received the utmost attention, he grew rapidly worse, and it was soon evident that all chance of his recovery was past. For some days, the spark of vitality flickered dimly in the lamp, and during that brief interval, his heart was opened to humility and penitence. On the 22d of December 1778, did Simon Mathurin Lantara close a long career of artistic merits and moral weaknesses; unattended by one familiar face—uncared for by wife, child, or friend—a lonely man without home or human tie, breathing his last sigh within the precincts of a public hospital.

A great portion of this artist's works were lost in the succeeding Revolution; and those paintings and sketches which bear his name, command a high price in the Parisian auction-rooms. Lantara is not so well known in this country as his merits entitle him to be. He was a really great and original painter, and his works deserve a place in our national collection beside those of Turner and Claude Lorraine.

#### A MARRIAGE-TABLE.

THERE was a marriage-table where One sat,  
Meek and unnoticed, till they asked his aid—  
Thenceforth it truly seems that he has made  
All virtuous marriage-tables consecrate:  
Therefore at this, where, without pomp or state  
We sit, and only say, or, mute, are fain  
To smile the simple words: 'God bless these twin!'  
I think that One, who 'in the midst' doth wait  
Ofttimes, would not abjure our prayerful cheer,  
But, as at Cana, list with gracious ear  
To us, beseeching; that the Love divine  
Will ever at their household-table sit,  
Make all his servants who encompass it,  
And turn life's bitterest waters into wine.

#### WHAT A SHELL CAN DO.

Round shot and shells were perpetually whizzing through the air day and night, falling in all directions amongst and through the devoted houses of the city. By night, the shells assumed a magnificent appearance, resembling so many shooting-stars, though, alas! far more formidable. One day, a number of us were viewing the scene of destruction from a battery erected on the summit of a high hill. Whilst we anxiously observed the amount of damage committed by the shells, there arose suddenly from the centre of the fort what at first appeared to us a huge mound of earth, which gradually increased in size until it resembled a hill some 600 feet in height; then it almost imperceptibly changed, and assumed the appearance of an excessively dark thunder-cloud, which eventually spread far and wide, concealing both fort and town from our wonder-struck gaze; a few minutes elapsed, and it entirely enveloped the high position we were occupying, although 900 yards from the explosion. This terrific catastrophe originated in one of our shells fortunately bursting in a powder-magazine, containing several tons of combustible ammunition. The sublime spectacle that ensued will never be effaced from my memory, nor, I imagine, from that of any who witnessed the sight. For several minutes, the atmosphere continued very close, not even a breath of wind stirring, but a deathlike stillness prevailed, precisely similar to that which precedes a dense dust-storm. All the guns ceased firing—all eyes were directed upwards, gazing with awe at the scene thus suddenly presented them. Men even addressed each other in a whisper.—*James's Volunteer's Scramble.*

A chapter of 'Things as They are in America' was prepared for this number, but, owing to other arrangements, cannot appear till the next.

## PHILOSOPHY FOR FRESHMEN.

THERE is no epoch in the social career of a young man so fraught with danger as that period when, having overcome the probationary struggles of hobbledehoyism, he finds himself launched, with its limited amount of experience, admitted to be even more dangerous than none at all, on the great sea of society. He has acquired self-confidence enough to cut up a tongue without any serious manifestations of alarm; and his conversation, if neither very profound nor very brilliant, has, at all events, become weeded of the slang of the school-room and the college. Young married ladies, it is true, do not notice him particularly; but old ones pronounce him a gentlemanlike young man; and very young ones vote him great fun. The honours of the social world are opening to his view, not as unattainable abstractions, as they have hitherto appeared to him, but as advantages which he feels he one day may be able to make his own. I have frequently, from that arm-chair which, in my character of a sort of oddity, society has been wont to award to me rather before my time, had occasion to notice the chrysalis struggles of this trying period; nay, I am not without a recollection of the difficulties which attended, not many ages ago, my own early efforts in a similar direction. The result has been an earnest desire on my part, from my safe anchorage, to lay down, for the advantage of those enthusiastic adventurers who are following in my wake, a few of the shoals and quicksands they will encounter on their first voyage across the troubled sea of society.

The first secret—to begin at the beginning—which we have to learn on our entry into the social world, and one not among the least difficult, is the apparently simple art of being quiet. It may safely be averred, that the error most usual on the commencement of a career is the

Vaulting ambition  
Which o'erleaps itself, and falls;

the conviction that we are nothing unless we are everything; and the fear lest we should be supposed to be silent because we have nothing to say.

Apprehensive lest society should fail to concede to him the position which is his due, the neophyte will be apt to assume one that is not, and attempt to shine in conversation before he has earned the right to lift up his voice in it at all. An attempt to talk well will inevitably result in failure, since, in conversation, absence of effort is the grand essential to success; failure will induce fresh effort, and fresh effort renewed failure. From being loquacious, he will become in-

trusive; from intrusive, flippant, until persons who, had he been content to be quiet, would never have noticed him at all, are compelled to do so, while they set down his assumption to impertinence, and attribute to excess of confidence what has, in fact, resulted from the mere want of it. It may be well for the Freshman to remember, that, to people accustomed to the world, the silence of reserve is easily distinguishable from the silence of stupidity. Study, then, O youth, ambitious of admission within the inner circles of the social Mæström—study quiet. Not that I would compel you to a mere gaping silence. The word quiet possesses, socially speaking, a far wider signification. It implies an unobtrusive amalgamation with the society in which one is placed for the time being—a power of self-command sufficiently strong to enable us to be content to take rank as one of a number, without aspiring too soon to be the one. The high places in a coterie, like the high places everywhere else, require an apprenticeship. We cannot step at once, full-armed, like Pallas from the head of Jove, into the enviable post of *infant chéri* of a circle.

In the course of his probation, the novice may perhaps observe amongst the most pretentious and successful of the party, men whom he may feel to be his inferiors in the very qualities to which they owe such success. He will, if he is wise, be careful how he yield to the temptation of entering the lists with them too soon; for if he does, he may be sure that, evince his superiority as clearly as he may, the attempt will result in his utter discomfiture. Society around, influenced partly by their sympathy with his rival as one of themselves, and partly by their want of faith in him as a stranger, will regard his challenge as an attack upon their self-love, and will withstand him as a common enemy, were he ten times the conqueror. He must call his self-command into play, and bide his time. Although the age of the worst description of affectation in men went out probably when the dandies died, and 'the Tenth' began to dance, there are still occasionally to be met with a stray weed of the genus, notwithstanding the blighting influence of the common-sense character of the present day. There are two especially observable, generally in not very deep soil, the growth of recent days, which seem to call for some slight notice in passing—the air worldly, and the air blasé. The affectation of worldliness generally comes first. Involving, as it assumes to do, such acute penetration and deep experience, it possesses an extreme charm for very young and not very vigorous intellects. There is my friend Browne, for instance, as well-principled and ingenuous as a fledgling as I know, who edifies his acquaintances by the wariest maxims of human conduct,

and was swindled the other day out of his last quarter's allowance by a cheat so transparent as could hardly have deceived an intelligent school-boy. Our mutual acquaintance, Tom Smyth, the two-and-twenty years of whose life have been passed quietly enough at the Charter-house and the paternal mansion in Bryanston Square—with reasonable facilities for independent ingress and egress—is in the blasé stage of the disease. He enjoys his comparatively limited opportunities of seeing the world with an apparent zest which wiser heads might envy; but I am concerned to learn that this seeming enjoyment has no actual reality, as he assures me that he has long ceased to feel any pleasure in anything—having made the discovery—he does not say where, but I suspect at the Lyceum Theatre—that there is nothing in anything, and that he is literally 'used up.' In vain have I ventured to hint to Browne that a little more worldliness in practice, and a little less in theory, might conduce considerably to his comfort and general respectability; he continues to scandalise ancient ladies, and appal very young ones, by the most Machiavellian theories of human conduct. Fruitlessly have I pointed out to Smyth that the vapid air and wearied step which is excessively appropriate in Mr Charles Mathews as Sir Charles Coldstream, who remembered the comet of 1811, is particularly absurd in Tom Smyth, after the active enjoyment of his fifth polka, and whose social experiences extend no further than to the introduction of that comparatively recent, but happily nearly obsolete, enjoyment.

When the versatile Mr Puff, in that *Tragedy* which we are never tired of seeing *Rehearsed*, succeeded in effectively posing all his characters upon their knees in a row before the footlights, he was made sensible, for the first time, of a simple but rather serious difficulty: he had made no provision for *getting them off* again. How often in society are we reminded of Mr Puff's dilemma! With how many a mortification have we not had to sympathise, arising solely from the omission of some one or other of our aspiring contemporaries to provide for this apparently simple difficulty, and to settle before his entry on the scene how he was to get off again. I happened, a short time ago, to be bidden, in company with my young friend Tom Spooner, to a social gathering at the house of one of those often excellent, but always inconvenient, acquaintances, whose invitations, either from want of experience in the hostess, or from some other cause, never convey the slightest idea of the nature of the entertainments they proffer us. Eight o'clock, the hour indicated on the present occasion, seemed, in these days of late visiting, rather suggestive of a few friends and a little music; but their copper-plate, and a fortnight's notice, appeared to point to something of a more elaborate character. My companion presented himself at my chambers on the appointed evening, apparelled with great magnificence. Much fine linen and buttons, a white ribbon round his neck, gloves immaculate on his hands, a gibus under his arm, and a geranium in his button-hole, presented an *ensemble* of which, but for my misgivings, I should undoubtedly have been extremely proud. As it was, however, I feared. In vain I pointed out that the affair was a very doubtful one, and that something of a rather more neutral tone in exterior would, at all events, be safer. In vain I suggested to my friend to defy the *Hints on Etiquette*, and carry his gloves in his hands instead of on them, until he should be sure of needing them at all; to leave his gibus in the passage, and discard the geranium altogether. In vain: he would leave himself no exit. Not soon shall I forget the discomfiture of that unwary young man when we were ushered into a dubiously lighted room, and welcomed to the hospitalities of a tea-tray and the acquaintance of four matrons in balzarine, a middle-aged spinster in a jacket, and two

school-girls in white muslin. My companion now felt the full value of the 'exit' to which he had attached so little importance. His gloves, which he would have given twice their cost to be rid of, were as tenacious as the shirt of Nessus; the crush-hat, of which, as though it had been a charm, he had resisted all attempts of the servant to divest him, crushed his spirits like a spell; and the odour of the geranium, which imparted an agreeable sense of festivity to the surrounding atmosphere, was as poisonous to him as the breath of the upstree. His earnest denial to the not unnatural suggestion of the lady of the house, 'I am afraid you expected a party,' was scarcely more droll than the air of dolorous magnificence with which he proceeded, in company with a portion of the aforesaid ladies, and one or two subsequent arrivals in frock-coats and reasonable shirt-collars, to devote the remainder of the evening to the relaxation of 'vingt et une' at twopence a dozen. The moral which Mr Spooner, as a reflective man, will have derived from this little experience, will probably be something like this: If we would avoid placing ourselves in a ridiculous position—and if not a point of primal importance, it is always worth a little forethought to escape—we shall take no step in society, even across a drawing-room, without first considering and providing, so far as we are able, against any contingencies which may seem likely to arise from it.

Smartness of conversation is an art much studied by the youth of the present day; but as a means of acquiring popularity in society, it is certainly a mistake. Nobody ever acquired good-will by mere clever talking. On the contrary, it may safely be affirmed, that the persons who are really liked in the world, are the good listeners—those wise people who, like Montaigne, 'always put their company upon those subjects they are best able to speak of.' Persevere in this lesson, and be sure that society will not only find out that you are a very agreeable person, but also a very clever one, though you may never have opened your lips, save to ask a question. Do not, O enterprising aspirant, conscious though you may be of an abundant wealth of conversational currency in useful light-change, despise, as unworthy of your genius, the apparently humble rôle of Chorus! Be assured, it is far easier to talk well than to listen well; far less trying to your horsemanship to trot your own hobby, than to ride double behind that of your neighbour.

That effort to gratify the personal feelings of those with whom we come in contact in society, which passes by the name of flattery, is one of the most powerful weapons of social conquest, but it is also by far the most difficult to wield. 'How happy am I,' observed a worthy who chanced to be once seated between Madame de Staël and the lovely Madame Récamier, 'at being thus placed between Genius and Beauty!' This mirror of chivalry—who, by the way, could surely never have been a Frenchman—did not perceive that this ingenious piece of flattery had much more in it of impertinence than of compliment, recalling, as it obviously must have done to each lady, the quality in which she was most deficient. Fortunately for this Solon, Genius was merciful, and came to the rescue. 'This is the first time I was ever called beautiful,' observed Corinne, gracefully referring, with true flattery, the compliment of intellect to her companion, whose beauty needed none. Direct personal flattery is impertinence, and will be always so regarded by any one who is worth flattering at all; because when we assume to a lady the right to praise her, we obviously claim also the title to censure. All flattery, like that of Madame de Staël, should be indirect—all compliment, inferential.

There is, at the same time, one description of flattery which, while it is the most easy, and may be safely employed with all persons, and on all occasions, is also by far the most unerring. Universal in its application,

it may be conveyed in a happy word, or be expressed even more speakingly in a judicious silence; may be visible in a bow, and audible in a tone; eloquent in a smile, and recognisable even in a dissent. I mean that flattery which is involved in an active consideration or forethought for the feelings of others in small matters. There are few of us sufficiently alive to the fact, how large a proportion of the impressions of pleasure and pain which make up our daily life arise from trifles. Every hair can cast a shadow. We may be satisfied that a deferential attention to our words, however unimportant—an evidence of memory of our tastes, however slight—and an anticipation of our wishes, however trivial, is a flattery we can none of us withstand.

Many a small reputation for wit has been gained by saying smart things of people in their absence; for it is by no means difficult to appear rather clever, if we do not mind being very ill-natured. For my part, I never hear a man speak depreciatingly of other men with whom he comes in contact in society, without being irresistibly led to the inference that he is jealous of them. Of course, no man ever speaks ill of women, who desires it to be inferred that he has been well received by them.

Although I by no means regard excessive enthusiasm as a peculiarly marked failing in the character of the ingenuous youth of the present day, and would by no means desire to deal hardly with it if I did, I am sometimes sensible of a slight tinge of it leading to much discomfort and mortification, in the hasty impulses which often prompt us, in the apprenticeship of life, to form ill-considered friendships. Now, it may happen that I may have the satisfaction of meeting at my friend Wigby's rooms a gentleman of 'parts,' who, with me, admires Mr Thackeray, knows the difference between the favourite British Havanna and the real growths of the Val d'Abajo, and possesses the still higher qualification of being able to appreciate the merits of my conversation. But it is by no means necessary, therefore, that I should propose to that gentleman to share chambers with me, smoke calumets of Gebeli with him ten days out of the following fourteen, and, as I find to be the general termination of such acquaintanceships, consign him to the limbo of absolute indifference, nay, intolerance, because he has proved not to possess qualifications which I never had the slightest right to expect of him.

Friendships are not difficult to make; but even the best and most sincere, on both sides, require much wisdom and reciprocal forbearance to retain. In the first place, we must not exact too much of our friends, or expect of them developments of friendship which their natures may not enable them to give. It is not so much what you may be able to offer yourself, or may even have a right to require, that you must look for, but merely such return as the character of your friends enables them to make; remembering that you are probably exacting from them some similar concession in another way. For example, there are some persons—sincerely attached to us, too, in their way—in whose friendship, if we are not advancing, we seem to be going back, with whom we are ever either mounting the hill or descending on the other side. At one time, we find our popularity steadily increasing; the servant admits us at the most unusual hours, and our hostess makes room on the sofa beside her with *empressement* as we enter her drawing-room; our invitation to stay dinner is conveyed in a tone which says: 'You will really gratify us by remaining;' and our pleasantries, good or indifferent, are received with equal enthusiasm, and extensively quoted. At another time, somehow or other, our visits always seem to fall at unpropitious moments; our invitations to stay and dine become less frequent, and ring in our ears not quite like sterling coin when

the warm manner and cordial tone which are its true exponents; our friend's friends, who never did think much of us, and had become rather weary of our praises, smile as they hear of us no more, and congratulate themselves cordially upon our ostracism; and we subside finally from 'Ever most truly yours,' to 'Yours sincerely.' Our first impulse is to renounce such ostracism as worthless, but this is an error. There are many degrees between acquaintanceship and the purest friendship, each worth having, and worth some sacrifice; and he is a poor philosopher who refuses a small pleasure because there are greater pleasures.

A little absence, a little forbearance, or some such small piece of self-denial, will enable us to preserve many a delicate friendship, of which less careful treatment would soon have deprived us.

By the way, speaking of friends' friends, there is no feature of our social experiences that requires more delicate tact than the conduct of our acquaintance with those we are in the habit of meeting at our friends' houses. *Les amis de nos amis sont nos amis*, says the French proverb. Rochefoucauld would never have said so. This social apothegm is to be received with considerable qualification. Our friends will always wish us to like their friends, and be popular with them: it is a tribute to their own taste and judgment. But the sympathy must not be too strong, and must be very gradually developed, or we are very likely to have to make choice between our old friends and our new ones.

There is a word for which I have a peculiar distaste, because it conveys to me an entirely false impression of the meaning which it is usually intended to express—I mean the word politeness. It is ever associated in my mind with the manners of a dancing-master, and the urbanity of a French cook, and in no degree represents that unobtrusive good-breeding which it is employed to describe. This quality—for it is a quality of the heart rather than a lesson of the head—is merely another form of that flattery of which I have spoken before, and which consists of a nice consideration for the feelings of others, and belongs to no age, to no period of life, and to no station in the world.

Such are a few of the ideas which a glance, a very little below the surface of social life, will probably give us, and which, like all just ideas, will be found to be based upon one simple principle. If we desire to attain to the privileges which society concedes to those whom it delights to honour, we must pay the same price for them we have to pay for everything else. We must be content, for a time at least, to put ourselves, our own vanities, impulses, conceits, and conveniences into our pockets, and practise, in the ever-varying forms our social apprenticeship requires, the wholesome duty of self-denial.

### THE STOLEN SHOES.

A DORADO, where gold may be had for the gathering, has formed the subject of the traditions, or exercised the fancies, of most peoples. The Arabs have never had an opportunity of experiencing what such a place really is; but their story-tellers make use of the idea in the following manner:—

In very ancient times, there lived, say they, in Cairo, in one of the streets near the foot of the citadel, a man named Abu Daood, whose poverty and misery were great. By trade, he was a cobbler; but destiny did not permit him to gain a living by the labour of his hands. Sometimes he remained for whole days without having a single pair of babooshes to mend; and when work was brought to him, he was very frequently so beaten down in the price he asked, or cheated by dishonest people, that he found it absolutely impossible to earn even the expenses of his shop.

Fortunately for him he had no wife or relation of

curse that had befallen him, and, strange to say, when he went home in hunger, he regretted he did not hear, as he opened the crazy door of his house, the voice of children, even though they should be crying for food. As he scarcely ever spent any money, or was seen to bring home provisions, the neighbours used to say that he was a magician, or that he lived upon air; but it was evident that this kind of nourishment was not favourable to him, for he was as thin and dry as a nail. The truth was, that he passed a great part of his time wandering up and down the streets, seeking for the news of some marriage or of some death; and then he went with the beggars, and other sons of sorrow, to dip his fingers in the great wooden bowls that are put out at the doors on such festive or mournful occasions. He found that in the scramble of the hungry, it was rarely possible for him to approach the dish more than once; but an old beggar of experience had taught him the art of scooping out, with one single plunge of his hand, the substance of a meal. In this way he managed to keep soul and body together; but as he was a man respectable in his ideas, he never asked for alms with the others when the wants of the moment were satisfied, but repaired at once to his shop, and sat waiting for custom until the going down of the sun.

From time to time, when he could get a little leather, he had actually fabricated some fine red shoes—half-a-dozen pair, which he had arranged in a row in front of his shop; but at first he had asked too much for them, and would not lower his price until their lustre became tarnished, and then everybody passed by, and went to bargain with other dealers. Poor Abu Daood in vain invited the fastidious to come and buy, going so far, sometimes, as to offer his wares as a present. Nobody paid any attention to him. Destiny had decreed that he should not make his fortune as a shoemaker.

One day a very old man, whose dress and appearance revealed him to be a Maggrebby, or Man from the West, came down the street, evidently looking for a pair of shoes, or for a cobbler; for he carried a tattered baboosh in his hand. Abu Daood espied him afar off, and felt inclined to rush towards him, and seizing the skirts of his garment, to drag him by main force to his shop. But the Shah Bomdar of the merchants had married his daughter that morning, and the cobbler had not only succeeded in getting two handfuls of rice, but had snatched a rag of mutton from a greedy blind beggar, who was making off with it after having had his fill. Thus fortified, he was enabled to repress the undignified suggestion of his misery, and to wait in breathless expectation for the result. To his extreme surprise, the Maggrebby passed all his rivals, and coming straight up to him, saluted him by his name, and said:

'I charge thee to mend this excellent pair of babooshes with the utmost care, and in the meantime, I will take of thy stock for my immediate use.' So saying, he slipped on two of the tarnished shoes, promised to return in the evening, and went away, leaving his own rage in pledge for the payment. Abu Daood was so delighted, that he ran immediately to three or four neighbours, and shouted with glistening eyes: 'I have sold a pair of shoes! I have sold a pair of shoes!' He set to work immediately to cobble the babooshes of the Maggrebby, but he found them in such a wretched state, that it was impossible to do anything with them. In vain did he put a patch here and a patch there, first renewing the heels, then the toes—it would have been far easier and cheaper to make a new pair. 'I must persuade this foolish Maggrebby,' said he to himself, 'to throw those miserable things into the street, and to buy new ones instead, if what he has already taken be not sufficient.'

Evening came, and no Maggrebby. Abu Daood had counted on a good supper, and kept his shop open until long after dark. All his neighbours put up their shutters, and went away one by one, but he remained obstinately

at his post, until the fear of robbers—superfluous fear!—overcame him, and he returned sorrowfully to his dismal dwelling. He lulled himself to sleep that night by curses on the Maggrebby, but was up before dawn, and on his way to his shop, still hoping that the owner of the ragged babooshes might come and clear up his character for honesty and fair-dealing. He could not refrain from relating his misadventure to his neighbours, who affected to pity him, but smiled maliciously one to the other, saying: 'Abu Daood has sold a pair of shoes!' and it became the joke in the quarter, when they observed the poor cobbler dozing over his hunger, to cry out: 'Here comes the Maggrebby!' But a whole year passed away, and he did not reappear.

At length one day the cry of 'Here comes the Maggrebby!' startled Abu Daood as usual; and looking forth to cast a reproachful glance at the wags, he actually beheld the same old man advancing towards him. His first impulse was to snatch up the pair of shoes, which he had cobbled during his interminable moments of leisure into something like shape, and thrust them down the throat of the dishonest customer; but he restrained himself, and when the Maggrebby had saluted him, as if nothing had happened, he said: 'The job thou gavest me was very troublesome. It would have been better to take a new pair.' Upon this, the Maggrebby laughed, and said: 'Verily, thou art a wise man, and a circumspect. I came expecting thy reproaches; but, lo! thou sparest me. This shall be counted unto thee.' So saying, he took out a piece of gold, and placed it in the hand of the cobbler, who well-nigh fainted with joy.

'Now, Abu Daood,' said the stranger, 'it will be fitting for thee to invite me to supper this evening. Take these two other pieces of gold, and buy what is necessary. I will come and join thee at sunset; and thou shalt conduct me to thy house.'

When the Maggrebby was gone, Abu Daood related his good-fortune to his neighbours, who shook their heads incredulously, and suggested that the pieces of gold were merely leaves of yellow paper; but the cobbler went and changed his money, and came back triumphant. Then the neighbours, who began to be jealous, warned him to take care lest he should fall into the hands of a magician. But Abu Daood replied: 'What can a magician do to me? He cannot slay me, unless it be the will of God: all he can do is to turn me into an ass, a buffalo, or an ape; and verily, this would be no great misfortune, for the asses, and the buffaloes, and the apes of this world have a more happy existence than I.' So Abu Daood went to prepare the supper of the Maggrebby; and going to meet him at the place appointed at sunset, found him already arrived, and took him to his house.

The supper was magnificent, according to the ideas of the cobbler, and had been prepared at a neighbouring cook-shop. The Maggrebby ate heartily, as did Abu Daood likewise. When they had washed their hands, coffee was brought and pipes; and the Maggrebby began to talk of travel, and foreign lands, and strange countries, whilst his host listened with eager ears, for a long time not venturing to speak. At length, however, he mustered up courage to say what he had upon his mind. It was this: 'I pray thee, O honoured master, if it be not impertinent—in which case, forgive me—tell me wherefore thou didst not return last year and pay me for my shoes. I knew that thou wast an honest man, and waited for thee in patience, until all the neighbours mocked me.'

'My son,' replied the Maggrebby, 'I would have refrained from telling thee this secret, lest it might introduce into thy mind covetousness and uneasiness; but since thou askest me, and since equivocal conduct requireth an explanation, I will state the whole truth; and may God pardon me if the consequence be the troubling of thy thoughts! Know, then, that I am

inhabitant of the city of Taroor, in Fezzan, and that my poverty and misery were great. But one day I learned from a pilgrim who rested in my house, on his way to Gebel Tor, that in the south was reported a land, the ribs of whose mountains, and the sands of whose rivers, were of gold, so that whosoever reached it might collect, in one day, wealth sufficient to make him envied of princes. I eagerly desired further information of this land; but he told me that its access was most difficult, and that, according to an ancient tradition, none of the sons of Adam could penetrate to it but he who should wear the stolen shoes of the cobbler Abu Daood. So I began to seek for a cobbler of this name, and travelled into many countries until age came upon me. I arrived at length in the city of Cairo, and heard of thy story; and stole the shoes in the manner which thou knowest. Then I set forth, and passed rapidly towards the regions of the south, until I reached a valley in the midst of great mountains. Here I found gold lying about like pebbles, and gathered together twice as much as I thought would be sufficient to support me in comfort to the end of my days. But the means of transport were wanting, and I looked round in despair until I saw a man with a yellow skin approaching me, and leading a camel. "Stranger," said he, "it is decreed that if any of the sons of Adam enter this valley, and collect gold sufficient to load one camel, he shall be suffered to depart, but if he collect more, he shall be kept as a slave." On hearing this, I thanked Him who had inspired me with moderation; and having placed my wealth in two small panniers, prepared to return. Then the yellow man said: "Remember that half what thou hast taken belongeth to Abu Daood. Farewell!" and he went away. I travelled for half a day with my camel, and found myself in a large city, whence a caravan was about to start for Egypt, and I started with it; but to my surprise, learned we were distant a six months' journey from Cairo, whereas I had reached that place in a few days. This is the whole of my story, and I am now ready to deliver over to thee half of the wealth which I have acquired.

Abu Daood was bewildered and amazed by this concise narrative, which concluded by holding out to him a prospect of prosperity of which he had never dared to dream. Yet, says the tradition—in this matter eminently philosophical—he soon passed from joy at his good-fortune, to regret at not having been able himself to visit the land of gold. 'Half a camel-load is little,' muttered he, as he gazed with glaring eyes at the Maggrebby. The good old man, noticing the expression of his face, said meekly and kindly: 'My son, thou art young, and I am ancient of days: take two-thirds, and be satisfied.' 'But I should have liked a whole camel-load,' quoth Abu Daood, still talking as if to himself. 'That was impossible,' observed the Maggrebby humorously, 'for thou couldst not steal thine own shoes.' Upon this the cobbler, preserved from wicked thoughts by the will of God, laughed, and replied: 'Think not that I envy thee what thou hast acquired; I receive what thou givest me with joy; but are there no means by which I, too, could visit this wonderful place?'

The old man hung his head for a time, and seemed to ponder deeply. At length he looked steadily at Abu Daood, and said: 'In my regard for thy welfare, I concealed something from thee; but what is written must come to pass. Know, then, that the yellow man when he departed from me gave me a ring, saying: "Should Abu Daood desire, in the covetousness of his heart, to come to this country, let him swallow that which he will find beneath the signet of this ring, and his wishes will be accomplished; but it will be better for him to remain in the quiet enjoyment of the wealth which thou wilt bestow upon him." ' Abu Daood held out his hand eagerly, and took the ring, and found within it a little piece of a greenish substance, which he swallowed. When he had swallowed it, all things

around him seemed to become confused: the Maggrebby's eyes grew round and red, his nose elongated into a beak, his mouth disappeared under his chin, his arms became wings, and his feet claws—in fine, he changed into a bird of strange aspect. The cobbler was at first frightened, and repented of his rashness; but the bird gave him no time to think, and snatching him up, clove the roof of the house, and carrying him high up towards the heavens, flew for the space of a night and a day, when he set him down, and immediately returned into the clouds.

Abu Daood found himself beneath a tree, forming part of a sweet grove, with branches full of birds of wonderful plumage and sweet song. He looked around in wonder, and rubbed his eyes, fearful that all this might be a dream. But having convinced himself that he was awake, he rose and walked until he came to the banks of a river, on the other side of which was a large city. A ferryman, with a very yellow face, spoke to him in an uncouth language; but seeing he did not understand, made signs that he was to get into his boat, which he did. On reaching the other side, he saw many people all bustling about, but all with yellow faces; and he now noticed that every one had a careworn, haggard expression, and that their features were now and then distorted, as if by severe pain. 'Verily,' said Abu Daood, 'all these folks have the cholera. I will hasten to collect gold, and escape at once from the country.' He proceeded along the streets, which were filled with shops of all descriptions, excepting provision-shops. There were mercers and drapers, and shoemakers and saddlers, but there were no butchers, or bakers, or fruit-dealers. 'This is a wonderful place,' quoth Abu Daood; 'verily, it is more wonderful than the valley which the Maggrebby saw.'

He had scarcely uttered these words, when a man touched him on the shoulder, and said: 'Friend, it is the hour of the evening-meal. Thou knowest the law. Come in to my house, for I perceive thou art a stranger to this quarter.' Then it is related that Abu Daood, fearful to transgress the law, obeyed this invitation, and was taken into a room dimly lighted, where was a table, and round the table a number of men and women, all yellow as fever-patients. But when the dishes were uncovered, lo! upon them was no food, but only heaps of gold, which, with moanings and contortions, and grimaces of disgust, the guests began to swallow. Abu Daood, obeying an irresistible impulse, put out his hand, intending to fill his pockets; but he soon found himself eating with the rest, and was unable to leave off until he had swallowed more gold than he had ever swallowed rice at a meal. After this strange supper, the guests dispersed, groaning and complaining; and the master of the house took the cobbler to a chamber where was a comfortable bed, and bade him rest until morning.

The tradition is luxurious in details respecting this extraordinary city, which was inhabited by the souls of misers and usurers, and covetous men of all descriptions, condemned for their sins to live on, performing all the ordinary functions of existence, except that their sole food was gold. A tone of burlesque satire pervades it; and the narrators, often in the true spirit of Dante, introduce amongst the various characters encountered by the cobbler, the marked portraits of people of their own day celebrated for avarice. An hour is sometimes occupied in this way, so that the story becomes merely a vehicle for satire, mingled with moral reflections. At length Abu Daood, well wearied of feeding on so indigestible a substance as gold, presents a petition to the princess of the city, and obtains an interview.

Dahabee, the princess, is a lady with golden hair, not of mortal origin, but a ginneyeh—a spirit. She rules her kingdom with inexorable justice, and severely punishes the fastidious mortals who choose to fast in

order to escape the accursed food alone allowed them. She herself feeds on fat pullets, on quails, on singing-birds, and other delicate morsels. The story of Abu Daood amuses her; and she even confesses that a single life had begun to be rather burdensome. She makes an offer of marriage, is accepted with dutiful resignation, and Abu Daood becomes king of the Golden Land. All traces of avarice, however, have been eradicated from his mind. In vain the princess, who has her secret reasons, exhibits vast treasures; in vain she makes progresses with him through the provinces, where mountains of gold blaze on all sides; he remains perfectly unmoved, without a single access of cupidity, content to eat his quail or his pullet in her society, and condemning the precious metals as viler than dust. A year having passed in this way, Dahabee, with tears in her eyes, confesses, that since he has been proof against temptation, she has no right to retain him any longer, and that she is bound to send him back to his own country. He makes a show of unwillingness, but really feels a longing for Cairo; so one night she takes him up in his sleep, and carries him in her bosom to his own house, where she sets him down, and flies away with a long melancholy cry.

Some women were passing Abu Daood's door, uttering the yughareet, or shrill scream of joy that announces a wedding. He awoke with a start, and dressing in an old habit, was about to run after them, to ascertain where the alms were to be distributed. But he remembered the events of the previous night, and of his dream. He looked round for the Maggrebby, but he was gone. In the place where he had sat, however, was a large bag filled with ingots of gold. There was enough to make him a rich man; and he lived ever afterwards a quiet and contented life, although he sometimes shed a tear to the memory of the Princess Dahabee.

## THINGS AS THEY ARE IN AMERICA.

### WASHINGTON.

THE season was now considerably advanced, and I had just time to make a run southwards, previous to the opening of Congress at Washington on the 5th of December, at which I felt some curiosity to be present. The journey would unfortunately take me twice over the same ground; but for this there was no help. I proposed to go through New York to Philadelphia, and thence without stopping through Baltimore to Washington, leaving the return excursion to be performed with somewhat more deliberation. As a chain of railways is extended from Boston much further south than I had any intention of going, it was practicable to make the whole journey in from two to three days.

On a Monday morning, at eight o'clock, I bade adieu to my kind friends in Providence, and taking my place in the cars, hoped to arrive at Philadelphia late in the evening. But in this plan of operations I was destined to experience disappointment. The cars got on admirably for about a dozen miles, when on slowly leaving a station, they were by a sudden concussion brought to an abrupt halt. Quietly and apathetically a few persons sallied forth to see what was the matter—I went with them; and finally, everybody in the train came out to learn the particulars of the disaster.

There we all stood in a group near the locomotive, which, with the tender behind it, was placed in a highly critical position. By an act of carelessness exceedingly common on the American railways, the person in charge of a siding had neglected to adjust the points to suit the up-train, and the locomotive having run

right off the track, was stuck fast in the middle of a rudely constructed wooden bridge; one of its fore-wheels whirling in the air over the abyss beneath. A little more impetus would have sent the whole train to the bottom of the river, which flowed through the ravine. As no personal injury, however, was sustained, the accident was rather amusing than otherwise. I had again an opportunity of remarking the placid impassibility of the American character. In England, there would have been vehement upbraidings of somebody or other. Here there was perfect imperturbability. Everybody looked on in silence, as if nothing particular had occurred. The only person who made himself heard, was an umbrella pedler, who, taking advantage of what he probably considered to be a fortunate assemblage of customers, rushed madly about recommending his wares to public notice, and assuring every one that he would never have such another chance of purchasing a good, substantial, and cheap umbrella. In a moment, I saw that my day's journey was cut short. The railway was only a single line, and the bridge, blocked up by the locomotive, was barely passable on foot. Our only hope was the arrival of a train in the opposite direction, which might exchange passengers and return on its track. Meanwhile, the morning was very cold, and most of us sought the refuge of a small station-house which was provided with a fire in an iron stove. Around the cheering blaze we clustered a solemn band, into the midst of which the everlasting umbrella pedler ever and anon thrust himself with his bundle under his arm, telling everybody that now was the time to buy a right good cotton umbrella. And so an hour was spent in the station-house, till the train from Worcester was heard approaching, and drawing up in time to avoid running in upon the unfortunate locomotive in its path.

'I say, conductor, how are we to get across that new bridge?' asked several passengers. 'You see it is quite open, with only beams for us to step upon, and hardly room to pass.'

The conductor paid no attention to any such inquiries, but began carrying across portmanteaus and carpet-bags, while the conductor of the other train did the same with the baggage under his charge; and for half an hour there was a scrambling of men, women, and children, conductors and baggage-masters, to and fro, till the exchange was wholly effected—the scene reminding one of the Vision of Mirza, no one, however, having the misfortune to drop through the openings in the bridge into the dark pool below. I had the honour of conducting a middle-aged lady and band-box across the gulf, and was rewarded with a warmth of thanks and good wishes which I had not on any previous occasion experienced. Having all successfully achieved the adventure of crossing, we took our places in the train, which then moved on to Worcester, leaving the passengers who had come with it to find their way to Providence as they best might. The last thing I saw was a crowd of them pulling at a rope which was attached to the errant locomotive; but how long they pulled, or whether they got the engine back to its proper position on the rails, I am unable to say. Without further detention, we arrived in Worcester, but so considerably behind time, that the morning train from Boston to New York had long since passed.

I did not altogether regret a delay of five or six hours

in what I found to be one of the prettiest and busiest towns in New England. The wide streets, ornamented with trees, were lined with large and handsome stores, while in the environs there appeared to be various manufactories of some importance. Worcester is a kind of American Birmingham; articles of hardware being its principal products, among which telegraph-wire and pistols have a prominent place. Recollecting the name of a manufacturer of railway-cars, I visited his establishment, and procured some information that promised to be useful. I was gratified with the respectable appearance of the operatives in the town, and learned that, in point of sobriety and other estimable habits, they were not behind their brethren in other parts of Massachusetts. At the hotel where I dined, the bar had been abolished; and as usual, the large company at the table-d'hôte drank nothing but iced-water. As the majority of the persons present seemed to be commercial travellers, the spectacle of such temperance contrasted strangely with what I knew to be customary in England.

Catching the evening train from Boston on its way to New York, I arrived at my old quarters in the Astor, an hour after midnight, and set off again, without delay, in the morning. The journey southwards from New York, begins by crossing North River in a ferry-boat to Jersey City on the opposite shore; and there a train is in waiting to carry forward the passengers. On this occasion, a large number required accommodation; for members of Congress with their families were taking their flight to Washington for the season, and others were on their way to regions still more distant.

The route through the state of New Jersey was tame and uninteresting. Much of the land is level, with a reddish sandy soil, yielding heavy crops of peaches and other fruits, and numberless orchards, some not quite stripped of their produce, were passed in the journey. At the distance of eighty-seven miles, the train was intercepted on the borders of the state by a navigable river, half a mile wide; on the further side of which was seen a large city of brick-houses, faced by at least a mile of wharfs and shipping. In a few minutes, we have exchanged our seats in the cars for the deck of a steamer, and are borne forward on the surface of the beautiful Delaware to the far-famed city of Philadelphia.

Reaching the city of Brotherly Love, I do not stay in my journey; but ungraciously passing over classic ground, hasten to the railway-station, where the cars are ready to set out. Now begins a fresh excursion, the train in the first place crossing the Schuylkill, and then proceeding through an old and settled part of Pennsylvania; but the land is still mostly level, and the soil appears thin, with a scrubby vegetation. It is usually understood that the river Delaware marks a change in climate. Here, we find the air milder than it is in the north; and the number of black faces which make their appearance give token of an approach to new social conditions. In the course of the day's run, several rivers and creeks of the sea are crossed on viaducts—one of them a long and low wooden erection on piles in the water; and at two places the *trajet* is performed, as at the Delaware, in ferry-boats. The first of the ferries is that of the Susquehanna, a large river in Maryland, flowing into Chesapeake Bay. The shifting here, to reach Havre-de-Grace, a small town on the southern bank, is complained of by some travellers; but I accepted it as rather an agreeable variety in the excursion. The interior of the steamer which carried the passengers across was fitted up with a restaurant, where tea, coffee, and other light refreshments were served at a moderate cost. For the accom-

modation of persons of colour, an inferior place of refreshment, fitted up separately, was under the charge of a respectably dressed female mulatto. In this arrangement there was nothing very novel; for in the New England states, as well as in the state of New York, I had everywhere found separate churches and separate schools for the use of the coloured population. By such experiences in travelling, one is partly prepared for the more severe distinctions incidental to the states in which slavery prevails.

Baltimore, which I saw for a short time in passing, and also on my return, occupies a pleasant situation on a rising-ground overlooking the river Patapsco, and is one of the best built, as it is among the oldest, cities in the United States. Placed on a navigable water connected with the Chesapeake, it appears to be a busy mart of foreign commerce, with a considerable number of vessels loading and unloading at its quays. Like other eastern cities, it has competed for the trade of the west; and now, by means of a railway to Wheeling, on the Ohio, has largely increased its operations. Although only about a hundred and twenty years old, Baltimore, in 1850, contained 195,000 inhabitants, and at present is in as thriving a condition as any city in the Union. It is celebrated for the number of its public monuments, one of which is commemorative of those who fell defending the city against the attack of the British in 1814.

Maryland does not contain many slaves, and I believe the number in this state, as well as in Delaware, is gradually diminishing. The harvest being past, and the fields generally stripped of everything but Indian corn-stalks and other refuse, the country had a somewhat dreary aspect. At different places, in passing along, negroes in frieze-jackets and round hats were observed ploughing up the stubble—the work not exactly such as would gain a prize at a match on Tweedside, although both horses and ploughs seemed to be of the best kind. Generally, five or six teams were going in one field, with an overseer riding about on horseback. In the distance might be seen the neat villa residences of the proprietors, with clusters of white cottages for the slaves and their families. The whole routine of farming seemed, indeed, to be different from what is observable in the northern states, where small properties are cultivated almost entirely by the settler and his family—every one working diligently, and nothing being paid away for hired labour of any kind.

Brought thus in sight of slavery, though under no revolting circumstances, I could not, with all my anticipations, avoid feeling somewhat shocked; but what for the moment chiefly occupied my mind, was the apparently uneconomic practice of buying men at a considerable cost to labour in the fields, instead of hiring and dismissing them at pleasure. To a gentleman who was seated before me in the car, I ventured to hint that the practice of using purchased labour must here place the farmers at a considerable disadvantage. He acknowledged that such was the case to a certain extent. 'Slavery,' said he, 'does very well, nay, is absolutely necessary, in the hot southern states, where no negro would work but on compulsion, and where free white labourers could not work at all without falling a sacrifice to the climate. But hereabouts, things are different. Our crops could be cultivated by farmers and their families, as in the north.'

'Then,' said I, 'why is the system of slavery continued—if it can be advantageously done away with?'

'Ah! don't ask me that,' was the reply; 'it is here an old institution, and matters have arranged themselves accordingly. It is an unfortunate state of things, and I daresay will be remedied some day. My opinion is, that much mischief has been done by the rough manner in which the Abolitionists have abused the slave-owners,

many of whom are very worthy people. If the subject were treated calmly, the system of slavery in these middle states would soon drop away. At this moment, considerable numbers of New Englanders are buying farms in Virginia, and introducing their own vigorous method of working. Exhausted estates are constantly to be had at very low prices; and in the hands of the smart Yankee farmers, who know how to plough deep and to lay on plenty of guano, they turn out capital speculations.

'Do these fresh incomers,' I inquired, 'employ negroes?'

'I think not; they trust to themselves, though they may have one or two helps.'

'Will the free negroes readily work for them?' I asked; touching on a rather trying question.

'Not if they can help it. The truth is, sir, the whole coloured races, of every shade, are a poor, listless set of people; not but there are exceptions among them. I never knew any who would not amuse themselves, or idle away their time, rather than follow steady employment. They do very well as porters, house-servants, coachmen, barbers, waiters, or cooks—anything connected with eating they are good at. They also do tolerably well as preachers; in short, anything that does not involve hard continuous work.'

'Would they not make good railway excavators?'

'Not at all; the labour would be too heavy for them. Notwithstanding the numbers of free negroes, our railways have been made principally by Irish. Ah! sir,' was added with a grin, 'Pat's the boy!'

'I am sorry,' said I, 'to hear so bad an account of the poor coloured races. May not their unfortunate defects of character be traced in no small degree to the treatment they have received?'

'Cannot tell anything at all about that,' replied my companion. 'I just know this, that I am heartily sick of them; and should be glad to see the country rid of the whole concern. They are a regular nuisance, sir!'

The person who made these remarks was an officer in the uniform of the United States' navy, on his way to Washington; and they were made with the sincerity and frankness of a sailor. I have thought it proper to record what was said, in order to convey an idea of sentiments, far from uncommon in America, respecting the coloured population.

It was dark before the train reached Washington. About nine o'clock, it drew up at a handsome station, outside of which were in waiting a string of carriages, invitingly open for passengers. By the recommendation of my new naval friend, I seated myself in that belonging to Willard's Hotel, and was in a few minutes riding towards the further extremity of the city. The moon shone out as we passed the Capitol, and by its silvery light revealed a large white edifice, with a dome towering above us on the summit of a commanding eminence. At the distance of a mile westward along Pennsylvania Avenue, the termination of my long day's journey was reached; and I thankfully sought refreshment and repose.

Travellers do not usually speak flatteringly of Washington. Every one seems to think it his duty to have a slap at its pretensions, which fall so very far short of the reality. It is my misfortune in this, as in some other things, to differ from most of my predecessors, and to see little ground for either sarcasm or jocularities. All that can be said of Washington is, that it is a city in process of being built and occupied; and has already, since its commencement about sixty years ago, acquired a population of 40,000, independently of an increase from members of the legislature with their families, and visitors, during the sessions of Congress. After the witticisms at its alleged spectral appearance, I was rather surprised to discover that, instead of a few mansions scattered about among trees, with miles of interval, it consisted of a number of streets lined

with continuous rows of houses, several fine public buildings, and a fair show of stores and hotels. Why the Americans should aim at building a city specially for the accommodation of their government, is not quite clear to the minds of Europeans, who are accustomed to great overgrown capitals in which the wealth and grandeur of a nation are concentrated. Originating partly in the wish to remove the administration beyond the immediate action of popular influences, Washington, I believe, owes its rise chiefly to the desirableness of placing the political metropolis in a locality apart from, and independent of, any particular state. The situation, though no longer equidistant from the several states in the Union, was exceedingly well chosen by the great man whose name was given to the city. The Chesapeake Bay, one of the largest inlets of the Atlantic, receives, about half-way up on the western side, the large river Potomac, itself for a long way up a kind of firth or sea two to three miles in width. Where it narrows to about a mile, at the distance of 290 miles from the Atlantic, the Potomac parts into two branches; and between these, on the left or eastern bank of the principal branch, Washington has been erected. The peninsula so selected, is spacious, with gentle slopes, and would afford accommodation for a city many miles in extent. On a central ridge of ground, with a stretch of open downs between it and the Potomac, stands the principal portion of the city; the Capitol, or seat of legislation, being at the eastern extremity, on a detached eminence, and the house of the President on the top of a rising-ground a mile westward.

Planned wholly on paper before a single house was built, the thoroughfares have been arranged in parallel, rectangular, and diagonal lines; those which run in one direction being called from the letters of the alphabet; and those which cross them being named First, Second, Third Street; and so on. The diagonal thoroughfares, the most important of all, are styled Avenues; and of these Pennsylvania may be considered the principal. I should think this is the widest street in the world. It measures 160 feet in width, the whole of the middle part for carriages being as well paved as the streets of London, and the footwalks laid with stone or brick. Along the sides of these footpaths are rows of trees, imparting an agreeable shade in the heats of summer. Built of brick, red sandstone, or wood, the houses throughout the city are of the smart and tasteful kind seen in the northern states; and as there is plenty of space for mews-lanes, nothing incongruous is obtruded on the eye of the stranger, unless it be the number of negroes of both sexes, principally slaves. At the period of my visit, much was doing in the way of levelling and paving the streets; and I learned that the value of property had lately risen considerably.

Having surmounted the initiatory difficulties, Washington may now be said to be in a course of improvement, creditable to the liberality of the nation; for all public works are undertaken at the expense of the Treasury. The district of Columbia in which the city is placed, a small territory, formerly a part of Maryland, and possessing no separate political character, is under the administration of Congress. Complaints are occasionally heard of the expenses to which the country is put on account of Washington; but if the people only knew the sums lavished by parliament on the palaces, parks, and police of the British metropolis, at the cost of the entire United Kingdom, they would have reason to be thankful for being so mercifully dealt with.

As yet, comprehended within a narrow compass, and open in all quarters to visitors, Washington may be satisfactorily seen in a single forenoon. The first thing done is to visit the Capitol, which is observed standing proudly on its eminence, surrounded by an enclosed pleasure-ground, at the eastern extremity of

Pennsylvania Avenue. In walking down this principal thoroughfare on the morning after my arrival, there was little bustle to remind one of being in a political metropolis of some celebrity. In the long line of street, there appeared only an omnibus on its way to George Town, in the vicinity, and one or two hackney-cabs. As the morning was fine, the steps of the various hotels were already crowded with lately arrived members of Congress; and the various parties clustering in debate, shewed that matters in connection with the approaching proceedings were in agitation.

Built of light-coloured stone, and in the Corinthian style of architecture, the Capitol, with its wings, handsome portico, and lofty dome, is an edifice of imposing appearance. Advancing up the exterior flights of steps, and entering the portal, we are ushered into a central rotunda, ninety-five feet in diameter, and lighted from the cupola above. On the walls around this spacious vestibule, and on a level with the eye, are placed a series of large pictures representing scenes in American history; two of which, the surrender of Burgoyne and of Cornwallis, cannot but bring unpleasant recollections to the mind of the English visitor. Chairs are placed in front of the pictures for the benefit of strangers, who are further accommodated with a printed key to the figures. At different points, doors lead to inner lobbies, whence access is gained to the Hall of the House of Representatives, and to the Senate-chamber, the Library, and other rooms—all so frequently described, that I spare any account of them on the present occasion. I must not omit, however, to mention one thing, from its extreme novelty. This is the perfect liberty to roam at will, without question and without payment, over the whole building. Nor is there any want of attendants ready and willing to afford any sort of information. By one of these, I was obligingly conducted to the top of the cupola, whence a splendid view was obtained of the city beneath; the two envying arms of the Potomac, beyond which were the woody hills of Virginia, forming a framework to the picture. On descending from this giddy altitude, I ventured to offer a gratuity to my conductor, which he respectfully refused, with an explanation worthy of recording: 'I cannot take any money, sir, for doing my duty. I am a public officer, and paid by the public.' If there be a door or gallery keeper in either House of Parliament, who would in this way refuse half-a-crown, let him by all means be named, for he must unquestionably be a prodigy!

The grounds around the building are prettily laid out with shady walks; and near the entrance is a sparkling fountain with a drinking-cup, to appease the insatiate craving for water which seems a kind of disease among the Americans. In the grounds on the east, is the celebrated statue of Washington by Greenough; it is of colossal size, in a sitting posture, and being executed in Parian marble, the effect is striking, though the spectator is not inclined to admire the exploded fancy of representing a modern soldier as a half-naked Roman. There are several other figures connected with the Capitol, but none which appears to require notice.

The public buildings I next visited were the Post-office and Patent-office, two remarkably fine edifices of white marble, near the centre of the town: The Patent-office contains a most extraordinary collection of models of articles which have been the subject of a patent; and no other spectacle could furnish so comprehensive a notion of the inventive faculties of the Americans. A spacious hall, with ranges of glass-cases lining the walls and projected across the floor, is full of every variety of object in mechanical art and science. Adjoining are apartments devoted to the examination and enrolment of articles; and on the floor above is a museum of natural history and objects of antiquarian

Museum, the collection is insignificant; and as centralisation at the cost of a whole people is repugnant to the constitution of the States, it may be apprehended that the national museum will never attain the extent and grandeur exhibited in the collections of European capitals. The articles most worthy of notice are certain relics connected with American history—as, the dress, sword, and camp-equipage of General Washington, and the original document in vellum, declaratory of the independence of the States, bearing the autographs of the signers, very much faded. In a separate glass-case stands the old wooden printing-press at which Franklin wrought when a journeyman in London in 1725-6. Removed from the office in Wild Street, Lincoln's Inn Fields, where the young 'American aquatic' had laboured at his vocation, the machine underwent several changes of proprietors, till it was finally presented to the government of the United States by Mr J. B. Murray of New York. An inscription on a brass-plate narrates the circumstance of Franklin having visited the press in London in 1768, when he came to England as agent for Massachusetts.

Among the latest additions to the attractions of Washington, the Smithsonian Institute is the most important; for it bears reference to the culture of general knowledge, on so liberal a scale as cannot but prove valuable to the community. Originating in the bequest of an English gentleman named Smithson, in favour of the United States' government, a large sum has been appropriated to the erection of a building of red sandstone in the Norman style of architecture, comprising a number of towers and pinnacles. The building occupies a favourable situation in the middle of a lawn, nineteen acres in extent, to the south of the city, near the road towards the Potomac. On visiting it, I found that it was not yet finished. But the main portions, consisting of a library and lecture-room, were open, both being free to all. Some valuable treatises have already appeared for general distribution at the expense of the institution. About a quarter of a mile westward, overlooking the Potomac, a gigantic obelisk was in course of erection to the memory of General Washington—to whom, with all deference, the multiplicity of such testimonials becomes a little tiresome, besides tending to suggest that America has never produced any other person worthy of commemoration. This enormous pile, which is designed to reach 600 feet from the ground, is reared by voluntary subscription throughout the United States. I suppose nothing, since the days of the Pyramids, has been built on so stupendous a scale.

When a stranger has seen these things, there is nothing left to do but take a look at the mansion of the President, and the adjoining buildings devoted to the Treasury and other administrative offices. To this quarter—the court end of the town, as I may call it—I now adjourned, for the purpose of calling on a gentleman connected with the government. Here, I have pleasure in saying, I was received in the same perfectly urbane and unceremonious manner I had uniformly experienced in my interviews with officials in all the places I had visited.

'You will call on the President, of course,' said this newly acquired friend.

'I should be glad to do so,' I replied, 'but I know no one to introduce me. I know nothing of the etiquette to be employed on the occasion.'

'Come along with me, and I will introduce you. The President is perfectly accessible.'

So saying, we set out immediately; and after crossing an enclosed patch of pleasure-ground, arrived at the White House, which has a fine look-out from the brow of an eminence, in a southerly direction, over the Potomac. The edifice, with a lofty portico of Ionic columns on its northern front, has a massive effect,

establishment. Neither as regards exterior nor interior appearances, however, was there anything to remind the stranger that the occupant was the head of a great nation. After seeing pretty nearly all the royal palaces in Europe, and being accustomed to observe that the persons of monarchs were surrounded, either for safety or distinction, with military guards, I was much struck with the total absence of force in any shape around the dwelling of the President; which, undefended from real or imaginary violence, can only, in the simplicity of its arrangements, be compared with a gentleman's residence in a quiet rural district. The only person in charge was a door-keeper, who admitted us to one of the lower reception-rooms, a large apartment, decorated in the French style, in which we paced about a few minutes till our cards were carried up stairs to the President, who was said to be engaged with his cabinet.

'Mention to the President,' said my conductor in giving the cards, 'that this is a gentleman from Europe.'

Whether this recommendation had any effect, I know not; but after a short delay, we were requested to ascend. In going up stairs, my friend introduced me to several members of the House of Representatives who were coming down. Two of them, I was afterwards informed, had been originally operative bricklayers, who, by a course of industry and self-culture, had raised themselves to an honourable position.

Almost immediately on reaching the assigned apartment, General Pierce entered from a side-room, and shaking hands, received me in a most agreeable manner; at the same time stating, that he was now much occupied, and hoped to have the pleasure of seeing me again before my departure from Washington. He was in a plain black dress, apparently about forty-five years of age, and I thought care-worn by the ceaseless and onerous duties he is called on to perform.

I regret that the demands on my time did not permit my waiting for any of the soirées at the White House, which usually commence with the congressional sittings; and it was not, therefore, my good-fortune to see any more of the President, to whom I am, however, indebted for the affable manner in which he was pleased to receive me. Returning to my hotel, I pondered on the singularly simple forms by which the President of the United States regulates his personal intercourse with the world.

I spent another day in Washington, making inquiries of various kinds, and forming some agreeable acquaintances in the place. It had been suggested to me that I should, as a matter of duty, call on the British minister. I endeavoured to do so; but after wandering about for two hours in a straggling suburb, west from the President's house, where his excellency was said to dwell, I failed in discovering his residence; no one to whom I applied knowing anything at all about it.

In these and other rambles about Washington, the number of negro slaves, of both sexes and all ages, in the streets and doorways, and serving in various capacities, was exceedingly conspicuous; and this anomalous feature in the social condition of the capital, within the very precincts of the executive and legislature, was felt to lower the respect which, on general grounds, we are disposed to entertain towards the federal government. It would almost seem as if Congress were ashamed of the existence of slavery within the district over which it exercises a municipal sway. According to a late enactment, no public sales of slaves or slave-pens are permitted within the district of Columbia. By this means, the more offensive attributes of the institution do not meet the eye in Washington; and those who desire to see sales by auction of human creatures, require to travel a hundred miles southward to Richmond, in Virginia. With no vulgar curiosity, but a wish to satisfy my mind as regards various

controversial particulars, I resolved to make an excursion to Richmond; and the account of this trip, a kind of episode in my visit to Washington, will furnish the subject of next article. W. C.

### LONDON AND LANGLEY-LEA.

RETURNING to London after a brief visit to that 'green nestling-place,' Langley-Lea, I seemed as much impressed with the contrast between the two localities, as if I had for the first time entered England's Great Metropolis, instead of being, as I am, an old sojourner in the myriad-peopled city. It was in the first faint dawn of morning—that gray and shadowy light which belongs neither to night nor day—when I alighted from the railway-train; and as I knew that it would be some hours before our little, dirty, industrious Cinderella would be winking and blinking, and rubbing her eyes and gazing on the door-step, I resolved to save the expense of a cab, have a peep at London before it was thoroughly awake, get a breakfast somewhere when I felt hungry, and walk all the way to my little residence in the southern suburbs. The respectable-looking streets I passed through, for some distance after quitting the railway-station, seemed as silent as the stones I walked over; not even the measured footfall of a policeman broke the echo of my own tramp on the pavement, and I could almost have fancied that I had come into a deserted city, so hushed and motionless and lifeless was everything around me. At long intervals, I passed some blue-liveried guardian of the night standing in the shadow of a doorway, as if waiting for the silent houses to awake out of their sleep. Now and then one would walk out of his hiding-place, look me full in the face, as if 'he would know me again; eye narrowly the little carpet-bag I carried; then perceiving somehow that 'I was not wanted,' bid me a kind 'good-morning,' and pass on. A man who can give an account of himself, need not mind where or when he wanders about London: many a highly-respectable gentleman connected with the daily papers walks homie at all hours, while to be seen out at such unreasonable times at Langley-Lea, would ruin his character for ever in the eyes of those primitive 'risers with the lark and lies down with the lamb.'

As I came into the business thoroughfares, and looked at the strongly barred window-shutters and massy doors, the grated fan-lights and iron-barred cellar-grating, I could not help calling up the shutterless windows, unlocked outhouses, the unguarded cattle and fowls, the open orchards and gardens which stood in unwatched security around the hawthorn-encircled village of Langley-Lea. I paused before a 'morning-house'—an early gin-palace, into which the night-revellers were rushing: it had just opened, and the gas was alight. O what a scene! Among the crowd were young women, whose dresses told that they were visitors of casinos, wine and supper rooms, houses licensed for singing and music, that keep no count of the hours nor of anything else but what is eaten and drunk. Better a thousand times, thought I, the rustic ignorance, and homely happiness, and simple innocence of Langley-Lea, than a knowledge of this 'life in death'—than a taste of these poisonous enjoyments; and as I walked along, I pondered over our old 'biting laws' in which we moderns term the dark ages; and thought how the whip, the stocks, and the prison would have been employed by our forefathers to have silenced the brawling of those children of Belial, had they in former times congregated at such untimely hours. Then I pictured the porch of the Old Lamb Inn—the red and green chequers painted on the posts, the snow-white cat that lay asleep, and broke the mass of shadow which deepened that picturesque portico, as I had seen it a few mornings before, when I passed by to traverse the dewy uplands which rose above Langley-

Lea. I turned from the ghastly faces before me—from crushed bonnets and flattened and soiled artificial flowers, to the rosy-cheeked milkmaid, who went singing with her clean milk-pail on her head, along the green lanes that led into the bee-and-butterfly haunted fields of Langley-Lea, and wondered what she would have thought could she have witnessed that scene.

I passed the drowy cab-stand, where the drivers, half-asleep, with bent heads, still raised their arms mechanically as they caught the tramp of footsteps, as if in their dreams they were still plying for a fare, though they had not energy enough to uplift their heads or open their eyes; and I turned from them to the farmer's boy I had seen on the previous morning driving his sleek horses to the beck, where the sweet springs threw up their silver cones of gray sand, and the speckled lark stooped to drink before soaring into the boundless expanse of heaven. A few dirty and draggle-tailed hens were pecking about under the feet of the head-drooping and jaded horses, their plumage the colour of the filth that had accumulated on the uncleansed cab-rank, and looking as if they belonged not to the same species as those I had seen in the early morning sunlight, strutting and foraging by the old horse-block and the long water-trough, and crossing the shadow which the tall sign-post threw across the sunshiny road at the front of the hostile in Langley-Lea. Three drunken youths, arm-in-arm, went by with crushed hats, blood-shot eyes, bawling out: 'We'll not go home till morning!' At that very hour, two days before, the bleating of lambs, the lowing of cattle, the singing of birds, and the hum of the early bee, had fallen pleasantly upon my ear, as I walked forth to see the sun rise above the green and wood-crowned summits that looked down upon the pastoral valleys of Langley-Lea. The very cats that were crossing the streets, or diving down areas, had a low, rakish, town-look—a kind of guilty appearance, as they hurried off, as if afraid of the light; very different from those I had seen at the clean cottage-doors, or sitting on the moss-covered pailings, looking up or lying in wait about the pleasant trees that every way fringed the landscape I had left behind. Even the houseless dogs that were coiled up on the steps before the closed doors, seemed to hear the approach of an enemy in every footstep, and to look suspiciously upon every passer-by, ready to run in a moment if their hard resting-place was approached: no children to fondle them, or shake down a handful of straw for a bed in some concealed corner of an outhouse, as the little rustics would have done for the ugliest mongrel that was ever saved from drowning out of the blind litter, and left to bark at the heels of the peaceful villagers of Langley-Lea. Yet even these dogs have their bedfellows in misery—human outcasts who have nowhere to lay their head, who share with them the dry arches of the railways, throw themselves down on the stony seats of the bridges, or coil themselves up wherever the shadow falls deepest in some receding doorway. None such as these haunt the sylvan solitudes of that far-away village I had so recently visited. I saw a barefooted, dirty girl, with her long, uncombed hair dangling about her face, come out of a dark, narrow court with a few bunches of water-cresses in a basket, that was bottomed with a patch of old cloth: she went up to a cab-stand, and dipped her cresses in the waterman's pail. I inquired of the old waterman where she had purchased them at that early hour, when, with a grin, he informed me that they were the remainder of her unsold stock of the previous day, which she had just brought out of the Common Lodging-house in the court, and would try to sell at the early coffee-houses. So, thought I, these breakfast-table luxuries have been lying all night in some close, unhealthy, and overcrowded room; and I pictured some such a one as I had read about in a police report—the floor filthy, the walls blackened; and

resolved to renounce water-cresses, unless I knew that our greengrocer had them fresh from market. Then I glanced backward to those I had seen growing about the sweet spring-heads and crystal streams that went dancing and singing through the flower-embroidered meadows of Langley-Lea, and thought how even that which nature made so pure and refreshing, might become poison through being kept in those pestiferous and fever-engendering lodging-houses, where human beings are packed and huddled together like pigs in a pen.

As I plunged deeper into the city streets, I soon caught that old familiar city smell, which is a compound of smoke and sewer-gas, and garbage, channels, and undrained cellarage. Oh, how different from the smell of wood-fires, the aroma of trees, the odour arising from the newly-ploughed earth, and the breath I had here and there inhaled from garden-flowers, as I walked forth in the sweet air only the morning before, in that half-awakened village from which I had just been borne away by the swift railway engine! As I stepped over some area-grating, and caught for a moment the poisonous vapour that arose, I marvelled how any one could sleep in rooms filled with the ascending pestilence, or live at all in such a health-destroying atmosphere; and I thought that, rather than dwell in such death-hastening houses, I would inhabit the lowliest cottage, and live on the hardest fare, which the humblest peasant enjoyed in the pastoral hamlet of Langley-Lea. I looked at the uncleansed pavement, the marks of feet on door-steps, the dust and soot that lay thick on the projections of shutters and the beading of doors, and thought of the clean looks of the wind-swept highways I had just left; of the white door-steps, on which the overhanging creepers threw a reflected net-work of leaves and branches; of the wooden porches and little arches of trellis-work, so cool, and clean, and refreshing, and that gave such a picturesque look to the village street of Langley-Lea.

As the morning advanced, I saw boys and girls waiting about the doors of shops and lodging-houses; many of them little, dirty, and half-clad things, with hunger-bitten looks; boys who had come to run errands, and clean shoes and knives in dark unwholesome cellars, where rats that come out of the sewers were ever running to and fro; and girls waiting to wash door-steps and shake door-mats, with a morsel of shawl over their thin, spare shoulders, and who would quickly become initiated in all the mean mysteries of those lodging-houses that had never been anything but lodging-houses. Some of these children are employed only for an hour or two in a morning; but where they go, and what they do, and how they pass the remainder of the day, it would puzzle even themselves to tell at night. I turned from them to those I had seen a day or two before, coming from the outlying homesteads along the green lanes and winding roads, with dinners in their baskets, on their way to school, or to fetch up or tend cattle, setting down their light load every now and then to look for a bird's nest, or a rare flower, or throwing down their books and slates on the roadside grass, to chase a bee or a butterfly—living images of health and happiness, and with no more knowledge of the world than the lambs whose bleating they were ever trying to imitate; and as I walked along, and contrasted the habits of these town and country children, I could almost fancy that they had sprung from different races, and belonged to nations that lay wide and far apart. Those town-children had an old look; there was a gray cunning about the corners of their eyes; the boys knew to a farthing what a marine store-dealer would give for a door-knocker, a scraper, a roll of lead-piping, or a brass or copper tap; the girls, what rags, and bones, and kitchen-stuff, would bring per pound, and what could be saved by fetching beer in their own pots; while the country children only

knew where the finest wild-fruit grew, where the most birds' nests were to be found, and where the sweetest and earliest flowers bloomed in the woods and valleys around Langley-Lea. One class represented cunning and artfulness in the highest natural degree, for they had been grown and reared in it; the other, green simplicity and artless innocence, and cunning so clumsily assumed, that it vanished the instant you gazed full and steadfastly into their large, round, staring truth-looking eyes. I could not help thinking, that there was more truth in the multitude-mouthed line of the poet Gray than the world gives credit for, and that the want of that too-much worldly folly, which made these town-children wise, was less to be deplored than the ignorance which the children at Langley-Lea in their innocence enjoyed. I regretted that the wisdom of the former had to be purchased at such a sacrifice, and that the ignorance of the latter could not be enlightened, so as to place them on an equal footing with the other purchasers of hard-headed and heart-indurating experience, without destroying their trustful nature, undermining the fair foundations on which innocence is built, and upturning the virgin soil in which pure and natural simplicity is rooted.

While these thoughts passed through the mind, my attention was attracted by a loud twittering to a bird-dealer's shop, the occupier of which was in the act of taking down his shutters; and as I paused for a few moments, and looked at the pretty prisoners trying in vain to wing their way into the flood of light which he had admitted, I became like them bewildered, as I thought of the miles of houses and the thousands of hungry London cats they would have to pass over and escape from before they could reach their free and feathered brethren, and in their low, sweet warblings, tell them all, they had endured as they twittered among the boughs and 'sun-goldened' foliage that overhung the 'loosened silver' of the brooks which at that very hour flowed through Langley-Lea. And those town and country children, somehow, became entangled together with the birds, in the same net-work of thought, and for the life of me, I have not been able to unravel the meshes up to the present hour.

I passed through one of the London markets, where the laden wagons came pouring in from the country, with their produce of vegetables, fruit, and flowers, and contrasted the groups who were soon busy unlading them, with those who had gathered up and piled together those country treasures. There were coarse masculine women, wearing men's coats and hats, some with short pipes in their mouths, whom you could tell at a glance spent a great portion of their earnings in tobacco and 'drains' of gin, and carrying with ease heavy burdens which many a man would have borne with difficulty. I knew from the names of the places on the wagons, that they had come from a great distance; and many of the far-away villages I had visited, and seen the picturesque orchards, hedge-sheltered gardens, and open fields with the rural population busy at work—busy even then, gathering and piling together other loads which would be travelling all night, like those which had just come in—and which only a few hours ago stood in the dew and sunshine of those pleasant places, and were tended and handled by those peaceful country people, who knew no more of the manners and customs of these gin-imbibing Gibeonites, than the rustic inhabitants of Langley-Lea. I felt sorry for the flowers and the sweet green things, as I thought of the unwholesome shops and filthy streets into which they would soon be removed; and could almost fancy, while I looked on them, that many already hung their heads in grief, and pined for the sunshiny bowers they had left behind; for, like Wordsworth—

'Tis my faith that every flower  
Enjoys the air it breathes.

Never more would the fresh dew hang like silver pearls upon their crisp leaves, or change, at a touch of the sun's sudden enchantment, into the burning brilliancy of deep-dyed rubies. As I walked on, the dust from the sweepings of shops caused me to sneeze again, and I thought that a little by-law, which would prevent Her Majesty's subjects from inhaling such kind of stuff, whether they liked it or not, would be very beneficial, and that a few green watering-pans would be quite as useful in those cloud-raising establishments, as in the little gardens of Langley-Lea. I saw a poor miserable cow driven along, and paused until the man milked it before the door of one of his customers. Poor thing! I wondered every drop of milk had not been churned into bad butter, through driving it along so many miles of streets, where it had to run every now and then from the barking curs and mischievous boys. I wondered where and how it lived. There was a cellar-stalled look about it, an appearance of having been fed on the refuse of greengrocers' shops and unpalatable grains. It ought at least to have been shod, for its hoofs were nearly worn off. It looked as if it had never had a holiday—never been out in the green fields for a day in its life; and I could not help wishing that it might have a few days' enjoyment, at least once a year, to plant its poor battered hoofs on the velvet grass, and moisten its mouth with the dew-bent cowslips that drooped their yellow heads on the springy and unploughed pastures of Langley-Lea. A pig that picked up its living in the gutters, arrested my attention in another street. It was a true London pig, made for running: long-legged, long-backed, lank-sided, looking very knowing, as if familiar with every ash-bin and hoard of filth in the neighbourhood. It bore the city-mark; and would, if painted by a Morland, on the same canvas with one of those clean cauliflower-coloured porkers which I had seen the other morning in the village, have stood well beside it for 'Town and Country'—a representative of London and Langley-Lea. I hoped and trusted that no portion of such a pig as that ever found its way in any shape to my table, either as Epsom sausage, York ham, Bath chops, or in any other disguise that such-like flesh is heir to.

I turned from that dusky grunter to the white sow and her creamy litter, which made a bright foreground to the high green bank where I had seen them the other day, and thought that even sucking-pigs had their enjoyments, and led a life of pleasure, equal perhaps to what we received when they were offered up to please our appetites. I heard the knife-grinding noise made by the London sparrows, and could not remember ever having seen one attempt to wash itself, either at sink, gutter, or water-butt; and I thought it not unlikely that in time they became cased like beetles, covered with congealed blacks from the sooty eaves under which they roost, and lost altogether that bright brown primitive sparrow-colour, and wholly changed the country habits which were still followed by the successors of those feathered forefathers, whose long generations had built and chirruped for centuries about the gray church and thatched granges of Langley-Lea. Porters, shopmen, journeymen, errand-boys, hurrying to open and clean, to arrange the windows and serve, to work at their various trades, to run here, there, and everywhere, was the first great stir of life in London as the morning advanced. Woodmen, shepherds, field-labourers, farmer-boys, journeying leisurely along to fell or bark the trees, count the sheep, and look after the lambs, sow and plough, hedge and ditch, fetch up cattle, fodder and water those about the farmyards, was, hours earlier, the life that stirred amid the surrounding landscape of Langley-Lea. The clamour of voices, the clattering of bars and shutters, and the mingled roar of hundreds of vehicles, told the farmer that the deafening day was fully awake: the lowing of herds, the bleating of cattle, the singing of birds, and

the humming of insects, proclaimed to the latter that nature had again shaken off her gentle slumber; and by the stirring of the leaves, they knew that the winds were again combing out her green tresses and drying up the dew, to make her ready to be reclothed in the golden garments, which, fresh from heaven, the world's great comforter, the sun, had ever ready to throw around her. The city streets, the bridges, the long lines of roads leading to the latter—the brown winding highways, the green lanes, the daisy-embroidered paths through the meadows, came and went, and crossed each other, as I regained the southern suburbs of London, while the picture-chamber of my mind was still hung with the fresh green dewy scenes of tree-embowered Langley-Lea.

Yet London has its charms, and these lie in its solemn associations, its gray antiquities, and hoary piles. I should miss the grim Tower, with its grinning and rusted portcullises; Westminster Abbey, with its mouldering monuments; Lambeth Palace, and its pious prisoners; the Bankside, with its memories of Shakespeare; St Mary's Overbury, and ancient Gower; Chaucer's Tabard in the undated borough; and a thousand other places which history has hallowed, were I doomed to end my days amid the peaceful green fields and fragrant flowers of Langley-Lea. The long-lost garden of Eden, could it be replaced and reflowered, could never interest me so much as this great gray old city, over whose buried pavements Briton, Roman, Saxon, Dane, and Norman have marched—for there I could not recall Harold, the last of the Saxons, crossing the bridge in the summer sunset on his way to the field of Hastings; nor William the Norman sounding his trumpets, when, flushed with victory, he passed over those very stones—which the brave but ill-starred descendant of Hengist and Horsa never more trod—to take possession of that ancient Tower which now bears his name. Had Wordsworth's child continued to be 'father to the man' throughout life, he might have remained all his days playing with the lambs on Langley-Lea; but he picked up the shell, which the great poet in the same passage dropped unaware, and though inland himself, caught the sound of those murmuring waves, which told of far-away oceans as he held it to his ear; and so exchanged for the sea-like roar of London the Arcadian whisper and pastoral pipings of Langley-Lea.

## THE MONTH:

### SCIENCE AND ARTS.

WE have had a few noteworthy lectures of late, which, had they not been delivered at a time when a craving for news of wars proved too strong a diversion, would have occupied greater attention than has in the present instance fallen to their share. One was by Faraday, 'On Magnetic Hypotheses'—a great and pregnant subject, as the learned gentleman shewed in his usual clear and thoughtful eloquence. It is taxing many ingenious minds to find out what may be the meaning of its phenomena; and the lecture may be accepted as another step in the elimination of negatives, whereby we shall at last arrive at the positive. Another, also at the Royal Institution, 'On Silica, and some of its Applications to the Arts,' by Mr Barlow, was of a more practical character. Of all the applications mentioned, that of using flint as a varnish for building-stone seems of most importance. Extraordinary as it may appear to talk of such a varnish, it has long been known, and is made from flint-sand or powdered flint, either of which, when mixed with the carbonate of soda or potash, and a certain proportion of charcoal, and fused, forms a soluble kind of glass, described as 'water-glass.' If the stones of a building are washed over with this, a chemical action, protective

in its effect, takes place, and sufficiently lasting to make it well worth while in practice. It may also be used as a glaze for interior walls, by adding to the varnish a weak solution of carbonate of lime; and if mixed with mortar or cement, it assists in rendering them water-proof. In Berlin, it has been applied with much success in a process called *stereochrome*. A wall is plastered with a preparation of lime and quartz-sand, and lightly washed with the water-glass. The painter then begins, moistening the place on which he works with water from a syringe, and so continues until the picture is complete; after which the whole surface is glazed with water-glass, thrown also from a syringe, until none of the colour comes away on touching it with a sponge. A picture finished in this way on the wall of a house in Berlin, has resisted all open-air influences for a year or more; and so satisfied are the artists and architects of that city with the result, that they are now applying stereochrome to the decoration of their new Museum, which, as many are aware, is a magnificent building. If such things can be accomplished in Berlin, why not in London, where a little decoration and brightening up are so much needed? The process is said to be preferable to real fresco, as the painting can be retouched at any time, no joinings are required, and it is much less liable to injury from damp and other atmospheric influences. Leaving the stereochrome out of the question, London, and some of our larger towns, would be less smoke-begrimed if the houses were coated with the flint-varnish only.

Then there is Professor Graham's lecture on what he calls 'Osmotic Force,' a term intended to describe the endosmose and exosmose, or passage of liquids in either direction through membranous substances. The subject is much more important than appears at first sight, for it has an intimate bearing on the vital phenomena of living beings. The professor has been working at it for some years, and now tells us what are the results. He finds the osmotic force to be, not capillarity, but a species of decomposition of the substance in which it takes place: hence, the vital functions in our bodies are an effect of decomposition—that is, ceaseless waste and renewal. Here we see, therefore, that highly suggestive views are opened into an interesting department of organic chemistry. It shews us in what way chemical decomposition becomes motive-power, or, as the professor expresses it, supplies 'the deficient link which certainly intervenes between muscular movement and chemical decomposition.'

When Sir James Ross was frozen up in Leopold Harbour during his abortive search for Franklin, he employed some of the weary winter-hours in a series of observations on the effect of atmospheric pressure on the surface of the sea; and he has now laid them before the Royal Society. He makes out a distinctly recognisable effect; and the barometer indicates it visibly by the oscillations of the mercury in its cistern. With a high barometer, the surface of the sea is low, and high with a low barometer; rising and falling with variations of the atmospheric pressure. It is believed that a large series of similar observations from many different places, would throw light on the phenomena of the tides. That certain physical effects—such as the rise and fall of the barometer, the swerving of the magnet, &c.—do take place day after day at the same hour, lends weight to the idea, that the influence of periodical laws on the ocean is more intimate and definable than hitherto supposed.

The astronomer-royal, unlike some other public functionaries, is contributing to our national advancement—that is, in astronomical science. He has introduced into the practice of the Observatory the taking of transits by a galvanic apparatus, as used in the United States, where the method was invented and first applied. For accuracy, it is beyond comparison preferable to the old method of taking transits by the

eye. The promised time-ball, too, is now set up at Deal, and being in communication with the Observatory at Greenwich, it indicates one o'clock to all vessels within sight in the Downs.

The builder of the *Lightning*, the swift ship that sailed from Boston to Liverpool in ten days, has just returned to the States with orders in his pocket from some of our leading merchants for first-class clipper-ships to the amount of a million dollars. Quick transport is the grand desideratum; and now that commerce is free to choose, she gets ships built where her purpose is best answered. But it is felt that with improvements in construction, there should be corresponding improvements in navigation: 645 ships and 153 steamers were built in this country last year, and in the same twelve-month 569 ships and 12 steamers were wrecked. The inference is obvious—mariners must work by reason as well as by rule. The project for a 'floating shipwreck asylum' on the Goodwin Sands, is again revived; it may save life, though not property. The float, as the projectors say, 'will be moored in deep water, at the edge of the Sands, furnished with life-boats, and every other requisite for rescue; together with signals, and various appliances to warn vessels of danger, and prevent shipwreck, where the possibility of prevention exists.' Ericsson has not abandoned the intention of crossing the Atlantic in his caloric ship: he has fitted condensed air-reservoirs to his engines, and with air not more than twice its natural density, he gets a sevenfold increase to the effective pressure. Whatever may be the result with locomotive engines, practical men in the States have come to the conclusion, that for all purposes of stationary power, air is three to one more economical than steam.

As regards motive-power, however, the most interesting fact therewith connected is, that a committee of the Academy of Sciences at Paris have reported favourably of M. Marié Davy's electro-magnetic machine, which will produce either a rotary or an oscillating movement. Their report has been followed by a grant of 2000 francs, to enable the inventor to perfect the machine; and they suggest to him the desirability of doing his best to discover a process for developing electricity, by any means whatever, so that it be cheap. The quantity of electricity held by the molecules of matter is immense: Faraday says, that the force which holds together a single drop of water is equivalent to a little thunder-storm; it is evident, therefore, that we have here a prodigious source of power, if we could but find out the way to work it. As is well known, we can already turn a portion of it to account; but the difficulty is, the recombination which takes place as soon as the bodies operated on are brought into contact. He who shall discover a way of preventing this recombination, so that the whole of the electricity may become available, will win fame and fortune, and be the Watt of electro-magnetic engines.

M. Gauguin has laid before the Académie a paper on the electricity of various kinds of flame, in which proof is shewn, that bodies during combustion are sources of electricity precisely analogous to the hydro-electric pile—a remarkable phenomenon, if true. With respect to the electric-light, the problem appears to be solved at Paris. We mentioned, a short time since, that it was in use to illuminate the works of the Napoleon docks, which were carried on by night as well as by day; and the apparatus was so complete, that for four months the light has been steadily burning. Economy is not its least recommendation, for the cost per night has not been more than 38 francs, which, as 800 men were employed, gives 4½ centimes—less than a half-penny per man. Of other matters which have come before the Académie, we may notice a further communication from Lord Brougham, carrying on his experiments on the refrangibility of light; and Foucault's investigations on the relative velocity of light in air and in

water, which are the more important, as he has discovered what has long been a desideratum—a means of detecting and determining the difference. The result is to shew the theory of emission to be incompatible with the facts.

Professor Abate of Naples, who brought specimens of what he called *metallography* to the Great Exhibition, has now added another to the many different processes for printing brought to light in the past few years. The process, to which he gives the name *Thermagraphy*, is a species of nature-printing assisted by art; in other words, it is the taking of impressions from natural substances, which are perfect representations of the original. It is wished, for example, to take an impression of a block of bird's-eye maple or satin-wood: the surface is washed with some active chemical fluid, such as sulphuric or hydrochloric acid, and wiped so as to leave but a moderate degree of moisture; and then an impression is taken in the usual way on paper, calico, or on another block of wood. This, at first, is invisible; but being exposed to heat, it comes out with every line and shade perfectly reproduced. About twenty impressions may thus be taken, when another moistening with the acid becomes necessary; and in this way any number of impressions may be taken. The effect is said to be best with light-coloured woods, though the darker kinds, such as rosewood, mahogany, &c., shew well on a ground dyed with a light tint of their own colour. Judging from the description, *Thermagraphy* should be neither a difficult nor expensive process: its application to decorative purposes is obvious; among which we shall probably see paper impressions of choice woods used as veneers for articles of furniture.

The French chemists are still pursuing their researches into the chemistry of vegetation, and in their zeal have got up rather a lively discussion, as to whether the azote of the atmosphere does or does not contribute to the nutriment of plants. As yet, experiment is in favour of the affirmative view. Boussingault, studying the composition of the air confined in vegetable earth, finds it notably different from the external air: even in land left without manure for a year, the carbonic acid is twenty-two or twenty-three times more in amount than in the atmosphere. On land recently manured, the difference is ten times greater, due to the slow combustion of organic matters in the soil. There, he says, as much carbonic acid in one hectare of arable land manured within the year, as in 18,000 cubic metres of atmospheric air. These are highly significant questions in the science of agriculture, especially now that we begin to get glimpses of what the productive powers of the soil really are. Payen has proved that carbonate of lime does really exist in certain plants as such, and not, as long contended, merely in the form of other salts, which the heat of the analysis reduced and decomposed.

Among the experiments made for the preservation of food, those by Schröder and Dusch, two German chemists, are worth mention, as much for their philosophical character as their results. They boiled two portions of meat, and placed them with some of the broth in glass jars. One of the jars was left open to the air; the other was so arranged as to receive air only through a tube filled with cotton, which acted as a filter. The meat in the open jar became putrid and offensive in less than two weeks, while the other, though kept shut up from February 9 to March 6, acquired no disagreeable odour whatever, and when warmed up again, had the perfect smell of fresh meat. A second experiment, continued from April 20 to May 14, was equally successful; and on sweet-wort, as well as on the meat, all tendency to ferment being effectually checked. An experiment made in a hotter part of the season failed; it failed also with boiled milk; but these failures are not regarded as fatal to the principle. It is known that heat will deprive the air of certain elements contained in it.

which seem to be essential to the processes of fermentation and putrefaction; and now we find the same effect produced by filtration.

Unger has published his *Essay on the History of the Vegetable World*, a work highly esteemed among the learned. He describes past, present, and future phenomena, the development of different geological periods, and the relations between them; how the geographical distribution of plants was accomplished; and the origin of different types. He shews further, that the work of change is still going on, and, reasoning from analogy, points out the modifications likely to be produced by the lapse of ages.

There is another book, too, which we may refer to, as its publication marks the progress of geological science. It is Sir Roderick Murchison's *Siluria*; a handsome illustrated octavo, on a branch of the subject with which the author's name is intimately associated. To quote his own words: 'Its aim is to mark the most ancient strata in which the proofs of sedimentary or aqueous action are still visible—to note the geological position of those beds which, in various countries, offer the first ascertained signs of life, and to develop the succession of deposits, where not obscured by metamorphism, that belong to such protozoic zones. In thus adhering to subjects capable of being investigated,' he has taken the best means to augment the interest and utility of his researches. Not the least remarkable fact in connection with this work is, that some 1700 copies were sold within a few days of its publication; and no inconsiderable proportion among circulating libraries.

#### SILVER IN BRITAIN.

On the high ground between Linlithgow and Bathgate, silver was dug in considerable quantity in the reign of James VI., the ancestor of the present Earl of Haddington being the proprietor. The king took the mine into his own hands; but it soon ceased to pay expenses. On the Ochil Hills, in Clackmannanshire, a silver-mine was worked at a later period, but ultimately without success. It is related that the proprietor, Johnston of Alva, taking a friend over his estate one day, shewed him a large excavation, with the remark: 'I took thirty thousand pounds out of that hole;' and soon coming to another equally large pit, added: 'And I put my thirty thousand pounds into that one!' At times small quantities of native silver, and some varieties of the ore, are met with in the copper-mines of Cornwall; but their value would hardly justify us in talking about silver in Britain. As we shall presently see, the metal we are in search of comes from other sources. Not fewer than L.160,000 worth was coaxed out of matters brought from underground within the four seas in the year 1850. Silver in Britain is, therefore, no unimportant fact; and seeing that some curious and interesting processes are involved in establishing the fact, we have thought a quarter of an hour's reading might be profitably devoted to this modern alchemy.

Not to keep the reader longer in suspense, we tell him that our British silver is got out of lead. Everybody knows there are lead-mines in England: they have been worked from a very early period, as proved by the 'pigs' stamped with the names of certain Roman emperors, preserved in the British Museum. These were perhaps cast from the ore dug out by poor captive Angles, forced to work under the eye of the grim, iron legionaries. And there is good reason to believe that, long before the time of the Romans, the natives of this country knew very well how to get the lead from the ground, and turn it to profit.

According to late returns, the produce of the lead-mines of Great Britain and Ireland, including the Isle

is more or less of silver; that of Cornwall containing from 10 to 20 ounces per ton; while the lead of Derbyshire has but about one ounce of silver to the ton; and between these two extremes there are various proportions, some localities being richer than others. The best kinds are said to have disappeared. In the reign of Charles I., the Cardiganshire mines yielded 80 ounces of silver to the ton; while in those of Craven, in Yorkshire, the proportion was 280 ounces. Such richness as this would almost bear out the opinion of the old metallurgists—that lead was nothing other than unfinished silver; Nature having from some cause suddenly held her hand in the process of development.

Without attempting to decide the question, we will take a peep at the ordinary method of making the lead give up its silver. The crude ore having been crushed and washed, to cleanse it from impurities, is smelted and cast in thick, heavy bars, or 'pigs,' as it is the fancy of the workmen to call them. These swinish masses may be sold at once, or exported, at the pleasure of the owner, who, however, if there be hope of a profit, will prefer subjecting them to the refining process, which will yield him the silver. The refining-furnace has a movable dome-shaped roof, pierced with two valved openings, for the admission of a blast of air from powerful bellows—with what effect will be shortly seen. At the bottom of the furnace is placed a *cupel*—an oval iron dish, about four feet long, with a bottom, supported on bars, composed of a mixture of fern ashes and burned bones beaten firmly into a cake. This is of essential service in the operation, as by its nature it facilitates the separation of the oxides—a fact well known to assayers. The cupels used at the Mint are not larger than a tiny tea-cup, half-filled with charcoal made of the cores of ox-horns, the best substance hitherto discovered for the delicate assays of that establishment; widely different from those of lead-works, the furnaces of which will hold from three to five tons of metal.

Let us suppose this quantity to be lying in the furnace in a molten state: fumes rise, and the surface is quickly dimmed by a yellow film that forms upon it, for lead, while at a red heat, absorbs oxygen very rapidly. The fumes are neither more nor less than so much of the metal flying away in waste as vapour. The appearance of the yellow film is the signal for the bellows to be set to work; and the blast, directed at pleasure by means of the valves, drives the film towards a small opening at one side of the furnace, where it is raked off in a constantly accumulating heap of litharge, as oxide of lead is called. This, we may remark in passing, can be again reduced to a metallic form. The blast, to be effectual, should produce a succession of ripples on the glowing surface, travelling from the centre and round the margin to the place of exit. By adding more lead in proportion as the litharge is removed, the process may be kept up for any length of time, until at last there remains in the middle of the cupel about a hundredweight of lead, highly charged with silver, to be put aside for another fiery trial, or course of cupellation. Silver does not oxidise by exposure to a high temperature; consequently, when the accumulated masses of 'rich lead' are melted, the small residue of lead is driven off, leaving the liquid silver pure and undiminished, ready, when cooled, for the hands of the silversmith. The process, however, is so wasteful—the loss of lead being about one-eighth in weight—that unless the mass be rich in silver, there can be no profit on the cupellation. For this reason, the lead of Derbyshire and some of the poorer kinds have always been sent into the market with their silver unremoved.

This is just one of the cases which would tax the ingenuity of manufacturers, to whom the loss on 18,000 tons of lead refined annually, was a serious considera-

methods were devised, but none proved adequate until, in 1829, Mr Hugh Lee Pattinson, of Newcastle-on-Tyne, experimented his way to a satisfactory conclusion. Availing himself of the difference of character in the two metals, he worked out a method combining theory and practice in a way not less advantageous than interesting. In the course of his experiments, he had observed, that while melted lead is cooling, small crystals form round the edge of the pan in which it is contained; just as crystals are seen to form on the margin of vats filled with a strong solution of salt. Struck by this fact, he examined it attentively, and found, after a few trials, that the crystals contained less of silver than the fluid portion of the metal. Here was an indication, which, if followed up, might be turned to account. If the crystals could be removed as fast as they appeared, would not the silver be left nearly pure at the bottom of the pan? So promising an idea was not lost sight of: the experiments were repeated on larger quantities of lead; and in 1838, Mr Pattinson read a short paper on his discovery and its results to the meeting of the British Association.

A brief description will enable us to comprehend the new process. Three or four iron pans, each capacious enough to hold five tons of lead, are set in a row in a mass of brickwork, constructed with the necessary flues and fireplaces. A framed railway, supported on pillars, immediately above them, facilitates the lifting of the metal from one pot to another. We will now suppose the first pot to be full of melted lead, from which all the refuse has been skimmed, leaving a clear, bright surface, and the signs of cooling beginning to appear in the shape of slender crystals round the edge. The workman then shuts the damper, and stirs the lead slowly from time to time with a long iron rod, to facilitate the cooling; laying it aside occasionally to scoop out the crystals, with a ladle as large as a warming-pan, and transfer them to the second pot. He does not hurry himself, for there is no blast to be managed, nor is the lead raised beyond its ordinary melting temperature; so he has neither to dread the waste of rapidly rising fumes, nor injury to his health by breathing them, which was more or less the case in the old process. Thus he proceeds, alternately stirring and scooping, until nearly the whole of the lead is removed, and a highly argentiferous fluid remains. The crystals in the second pot are then again melted, and in like manner carried over to the third pot, to undergo a third melting, which leaves so small an amount of silver in the lead—not more than fourteen or fifteen pennyweights to the ton—that it is without further treatment run into pigs for the market. The rich metal is afterwards cupelled, in the way before described; but so small is the quantity of lead remaining, that the loss by oxidation is reduced to a minimum—not more than 120th of the whole.

Thus, by taking advantage of the simple natural law, that melted lead will solidify while silver remains fluid, a large branch of trade finds its profit increased, and health promoted. Lead containing not more than three ounces of silver to the ton, may be profitably cupelled by the new process: hence it is that recent returns of the production of silver in England exceed those of former date, though still forming but a small portion of the 2,000,000 poundweights which every year are dug from beneath the surface in different parts of the world. Some idea of the consumption of silver may be formed from the fact, that the weight coined in England from 1816 to 1840, was 3,376,155 pounds; and nearly 1,500,000 ounces of silver-plate are annually manufactured and charged with duty. Great as is the consumption, it goes on increasing, aided in no unimportant degree by electrotypy, which, by cheapening silvered articles, has increased the demand.

We may add that Mr Pattinson considers the process that now bears his name to be an act of 'true

crystallisation, in which the homogeneous particles of lead are drawn together by virtue of their molecular attraction, to the exclusion of the foreign body, silver.' It is not the first time that mechanical science has benefited by a natural process, and there can be no more hopeful subject of inquiry than that of seeking for others.

#### SOFT FELL THE SHADE OF EVEN-TIME

[These elegant verses are from a little volume of poems, containing many of equal sweetness and poetical merit, but for the most part of too exclusively religious a character for a lay periodical.\*]

Sorr fell the shade of even-time;  
Methought, amid its wan decline,  
I sat in quiet room,  
Rich curtains veiled the window quaint,  
The day was waning fainter, faint,  
Up rose the lady moon.  
As darker, darker grew the town,  
In crimson light the sun went down  
Beyond the hills afar;  
Fair children, weary with their play,  
Came toiling up the flower-sprout way;  
Like hope amid the clouds of doubt,  
The lights below came beaming out,  
Above came star on star.  
As bright and brighter rose the moon,  
Oh! soothing sweet, a quiet tune  
Came streaming o'er the night;  
A tender voice, a snow-white hand,  
Woke echoes as from choral band,  
And softly through the gloom  
It sung: O heart, be strong! be strong!  
Whatever may fall of blight or wrong,  
There ever shines a light;  
Look up, O sweet as eye of love,  
A light to lead the heart above,  
That seeks the pure and right.

\* *Heart Histories*. By Marion Paul Aldr. Johnstone and Hunter. London and Edinburgh.

#### CHARCOAL VENTILATORS FOR DWELLING-HOUSES AND SHIPS.

The principle of the charcoal respirator which I brought under the notice of the Society of Arts during the month of February last, may, I apprehend, be very advantageously extended, under particular circumstances, to the ventilation of ships and buildings. If a thin layer of coarsely powdered charcoal is enclosed between two sheets of wire-gauze, and inserted into a suitable framework in those portions of ships and buildings where foul air is apt to accumulate—such, for instance, as in the vicinity of water-closets and similar nuisances—all the impurities in the air will be absorbed and retained by the charcoal, while a current of pure air will alone be admitted into the neighbouring apartments. The charcoal ventilators should be furnished with a slide at top and bottom, by means of which they may be easily filled or emptied at pleasure. Such an arrangement would frequently be found useful in the wards of hospitals, and in the impure atmosphere of many of the back-courts and mews-lanes of great cities. A layer of charcoal might be often advantageously placed in the lower portions of buildings, immediately under the wooden flooring, as it would keep the floors warm and dry, and likewise prevent annoyance from any sewerage-water or other impurities that might find their way into such situations. These are a few only of the useful applications to which charcoal-powder may be made available for sanitary purposes. Many others cannot, ere long, fail to suggest themselves.—JOHN STENHOUSE.

## THE GOODMAN'S CROFT.

IN Scotland, about two hundred years ago, there still lingered some traces of an ancient superstition of a curious kind. It consisted of the practice of keeping a certain field, out of those constituting a farm, consecrated to the potentate of the lower regions. This field was called the Goodman's Croft—a term evidently selected in the spirit of complaisance towards the personage in question, and therefore in conformity with the object in view, which confessedly was that of soothing a Power which men felt it was difficult to battle with. The Goodman's Croft, of course, remained untilled and unrequited, albeit perhaps the best piece of land in the district. There it was, in eternal fallow, covered thick with weeds, and necessarily a nuisance to the useful fields around it. Synods fulminated against thus cottoning to the enemy; special parsons used particular persuasives to get the practice abolished; but the Goodman's Croft was, nevertheless, maintained in many places till the time of the Civil War.

Absurd as the idea looks, we suspect it had some determinate foundation in our nature; for, look narrowly into the minds and habits of men, and you will scarcely fail to detect in every instance something of the character of a Goodman's Croft. Sometimes, it is a piece of the moral constitution abandoned to nettles, henbane, and deadly nightshade, while all the rest is kept under the most careful culture. Sometimes, it is a small district of folly in the midst of a somewhat rigorous rationality. Very often, you would think that the more sage and correct the man, the more decided is this strange exceptionality in his character. A fool or a scamp has a bad farm all over—weeds, broken fences, uneven ridges, and all the rest of it. But where the moral farm is generally good, there you see the one field of thorough inutility and devil-worship—the Goodman's Croft.

You find it in the clever man of business. To all appearance successful as well as active, he in his secret heart strains away towards some other pursuit, which, whether followed fully or partially, could never yield him a farthing. He perhaps struggles against the tendency, sensible of its absurdity, and disgusted with himself for giving way in the least to inclinations which he cannot avow before the world. But, generally, he is unable entirely to save himself from the besetting temptation, and at the best makes a sort of convention with himself, to be the judicious man of affairs for so much of the day, and the fantastic schemer, the bad artist, the unreadable rhymist, or whatever else it is, for the rest. Possibly, this apparently sharp-witted man of affairs indulges in a succession of aberrations.

We have known one who for years studied alchemy, and at another time was the dupe of a person who set forth claims to a dormant peerage, spending in both ways a large proportion of the income which he realised from his industrious mercantile career. You could not have in any way outwitted this gentleman on 'Change in matters of business; but he had one streak of whim in his composition, and this it was possible to work upon at private moments, to results of very serious consequence to himself.

You will find, again, an artist or an author who is equally liable to a temptation to desert his proper course, and with equally fatal results. Not many years ago, P—— was at the head of a particular branch of his profession as a landscape-painter. He could produce a capital picture in a week, and no picture he produced failed to find a purchaser at a good price. He might, in short, have realised a competency in a few years. In point of fact, he was, with his family, in constant poverty; and the reason was an irrepressible tendency to out-of-the-way mechanical contrivances. As a specimen of his conduct—an old umbrella having been left one day at his house, he set to work upon it, took it all to pieces, and out of the pieces produced in a few days a curious novelty in the way of mill-engineering, to the admiration of his little children, but the extreme distress of his wife, who saw, meanwhile, the easel deserted, and her larder empty.

So also it is not difficult to find an author of something like this description. He has been induced to write books of a certain kind, which he can execute well, and which, being useful to the public, are successful and remunerative. This is obviously the line in which Duty calls him to go, and he obeys the stern lady's behest to a certain extent. But all the time, taste or whim has established a literary Goodman's Croft in his mind. He has his tragedy, or his new system of physics (overturning Newton), or his History of the Lower Empire, demanding his attention. He would far rather be at one of these undesired works, which will never turn him in a penny, or bring him a single puff of the trump of Fame. So he goes to his legitimate task with reluctance, gives it little of the finer force of his mind, and hears of its success with indifference. He would rather spend twelve hard-working hours at the Goodman's Croft, than three at the proper business of the intellectual farm. With such difficulties from himself has the man of letters to contend, besides all those external ones of which the public have so often heard.

No philosopher is ever without his Goodman's Croft, in the form of some cherished fallacy or absurdity. Not even the men of highest reputation and most

venerated counsel are exempt from this law. One here and there may have the art to conceal it from all ordinary observation; but scan him closely, or wait for his demonstrations, and you will be sure, sooner or later, to get a glimpse of it. The fact is, they tire, like the vicar of Wakefield, of being always wise. *Semel insanus omnes*. Or it is not possible to maintain a vigilant guard over the judgment at all points; and so, while we are keeping out the flood at doors and windows, it finds its way in down the chimney. Perhaps, just the more deeply wise a man is in one direction, he is apt to be the more childishly simple in another; and thus it may come about that the public, in trusting to your dictum on a particular subject, because you have delivered yourself well on another, makes a great and dangerous mistake. We hardly know anything more perilous than to take confidential and uncorrected counsel from a philosopher on a point which chances to lie within the confines of his Goodman's Croft.

Does not all this look very much as if there were a primeval determination that there should be no perfect intellect, no unfailing *morale*? There is a tedium in excellence which forces us to seek a relief from it. Entire sagacity frightens and distresses us. It does not do to keep the whole farm like a garden, without a weed, every bit of space turned to use. That was for the Garden of Eden alone. As human nature goes, it calls for a Goodman's Croft.

#### YOUNG RUSSIA.

THE political character of the Russian Empire is much more Asiatic than European; we might even say, the Western elements of civilisation have been made use of in Muscovy, only to preserve Asiatic despotism from all those restraints which in the East form a check to the immense power of the sovereign. In Russia, just as in China, in Persia, or in Turkey, there is no hereditary nobility, which, from the weight of its influence on the people, might be worth consideration by the sovereign. The nobility is entirely dependent on the favour of the court: it is a bureaucracy, not a landed aristocracy. The Russian prince has no other political rank than that corresponding to the civil or military office he fills: if he holds no office, he is, politically, a cypher. Just as in China, Persia, and Turkey, there is no caste, no peculiar class of the nation enjoying particular political privileges that give them some share in the administration, or even permit to them the exercise of a passive resistance without violation of the law. Just as in the Mohammedan countries, a great proportion of the inhabitants are excluded from many civil rights. Thus the evidence of the serf in Russia is not accepted against the lord; he has not even the right of free locomotion; he is bound to the soil; he is not allowed to choose his own way of livelihood; he dares not even give education to his children, without the consent of his master. But in China, Persia, and Turkey, there is one controlling power, superior even to the will of the Emperor, Shah, or Sultan—the power of religion and of traditions. The shah and sultan have no legislative power; the Koran is the law-book, which cannot be set aside by the sovereign; nor has he even the right to interpret it according to his own will. Whatever may be his interpretation, it must be submitted to the chief-priest and the council of lawyers, whose decision alone (Fetra) can give it the power of law. The shah or sultan cannot even declare war or conclude peace, before stating the question to the Sheik-el-Islam (the religious chief), and receiving his approbation. But in Russia, the czar combines the civil and religious supremacy—the 'Holy Synod' has become an administrative bureau, presided over by a layman; in fact, by a colonel, the *aid-de-camp* of the emperor. Besides, there are no traditions, no legal precedents to regulate the administration. The will of the emperor is the supreme

law in every case; and even the judges of the supreme court must bow before a ukase of the czar, should any contending party be influential enough to obtain an order from the emperor to reverse their own sentence. The emperor, indeed, is more omnipotent than the English parliament, for his will is above both the common and statute law of the country. Herzen describes the legal position of his country in the following words:—

'It might appear strange that we applied the word *provisional* to the imperial administration; yet it expresses entirely the most striking character of the Russian government. Its institutions, its laws, its schemes, are evidently temporary and transient, without precise and definite form. It is not a conservative government, for it has nothing to conserve but its own material force, and the integrity of its territory. It began with the tyrannical destruction of the traditions, the laws, and the manners and customs of the country; and it continues to exist by a series of measures, one destroying the other, without acquiring stability or systematic rule. Every new reign brings into question the greater part of the rights and institutions. The government prohibits to-day what it ordered yesterday, and continually modifies, explains, abrogates the laws. The code published by Nicholas is the best evidence of that want of principle and unity in the imperial legislation. The code is a jumble of all the existing laws—of orders in council, of enactments and ukases, more or less contradictory, expressing much more the character of a particular sovereign, or the exigencies of the passing moment, than a spirit of rational legislation. The code of Czar Alexis is the foundation; the orders of Peter I., of quite a different tendency, are the continuation; and upon them are ingrafted laws of Catharine II., dictated in the spirit of Beccaria and Montesquieu, and orders of the day of Paul I., surpassing anything of the most absurd and arbitrary kind in the maddest edicts of Roman emperors. Since the Russian government has no historical root, it is not only not conservative, but it is enamoured of innovation. It leaves nothing at rest, and though it rarely improves, it always changes.'

Such being the character of the Russian government, it is quite clear that the individuality of the emperor, for the time being, supposing him to live for any considerable number of years, must influence the type of society, and the mould of intellect, to a degree equally unknown in Western Europe and in Asia. I do not mean to say that the czar has the power of moulding the character, and fashioning the thoughts, of his subjects; on the contrary, the result may be just the reverse of his wishes and plans, yet this result is always a natural consequence of his character. He may, of course, easily tinge society with the uniform varnish of French or German civilisation, just as his tendencies may lean to the one or the other; he may, by such a foreign tinge, destroy the connection between the bulk of the people—whom he cannot reach with his civilising varnish-brush—and the upper classes; he may then play off the serfs against the gentry, and the gentry against the serfs, in case either should be refractory; but he cannot command the march of intellect—he cannot accelerate, he cannot direct it. His custom-houses, his passport-system, and the difficulties thrown in the way of those who desire to visit foreign countries, cannot prevent the invasion of Russia by foreign ideas. He is able, indeed, to check their free development, but the compression only makes them the more powerful.

The necessary conflict between the soul-killing rule of a centralised bureaucracy and those Western ideas that cannot be kept out from the Russian Empire, introduces duplicity and deceit into the national character. From fear of the secret police, the Russian grows accustomed to hide his thoughts; his words are not the expression of his sentiments, but the reverse;

and if he surmises that he has betrayed his feelings, he is tempted, as the only means of self-preservation, to evince his loyalty by denouncing the incautious words of another. The majority of the higher classes, who do not like the mean pedantry of Russian official life, and whose feelings revolt at the idea of being teased for a score of years by some overbearing German superior, until they themselves rise to higher official rank, and are able to spend another score of years in tormenting their inferiors, throw themselves frantically into a life of dissipation. Egotism becomes the all-pervading feeling, since the rule of the czar has isolated the individual, and made all openness of soul and all confidential conversation nearly impossible. Men of generous character and of a noble ambition have no open field—they are the victims of government policy. Nearly all the heroes of the national novels are portraits of such superior men, who must perish, because they cannot struggle against the constitution of society. Their prototype is Eugene Onegin, the hero of Pushkin's poetical tale of the same name, the most popular of all the personages of Russian fiction. Herzen says of this character:—'Onegin is an idler, since he never had any serious occupation; a supernumerary in the sphere in which he is placed, without having the power and determination to step out of it. He is a man who tries everything in life down to death itself, and who would try that, in order to see whether it is not worth more than life. He has commenced everything, without pursuing anything; he has thought so much the more, that he has acted little; he is old at the age of twenty, and begins to grow younger through the agency of love when age creeps upon him. He has always waited for something, as we all have done; since nobody is foolish enough to believe in the stability of the present state of Russia. But nothing has happened, while life was passing away. The character of Onegin is so national, that it returns in every novel, and in all poetry that has had any success in Russia; and this, not because it was intentionally copied, but because we see it always around us, or feel it in ourselves. In fact, we are all Onegines, unless we choose to bury ourselves in a bureau or in a farm.'

'Civilisation leads us astray—it destroys us; it is civilisation which makes us a burden to others and to ourselves—a crowd of idlers, full of whims, and unfit for action. It is civilisation which drives us from eccentricity to debauchery, making us spend without regret our fortune, our heart, our youth, in seeking occupation and excitement for mere distraction. We do everything—we saturate ourselves with music, philosophy, love, war, or mysticism, only to forget the immense emptiness which oppresses us.'

'We receive a liberal education; the desires, tendencies, and sufferings of the contemporary world are imaged in our souls, and we are then told: Remain slaves, dumb and passive, or you are lost. For indemnification, we have the right of flogging the peasant, and of spending, in the gambling hell or the wine-house, the tax of blood and tears we wring from him.'

'The young man falls in with nothing which can fix his interest in this world of servility and low ambition; still, it is in such society he is doomed to live, since the people are still more distant from him. Society is at least composed of beings, however degraded, of his own stamp, whilst there is nothing in common between him and the people. The traditions have been broken by Peter I. so completely, that there is no human power to unite them again, at least at the present moment. There remains, therefore, nothing for a noble mind but isolation or struggle; and not having sufficient moral power for either, we become Onegines, if we do not perish by debauchery, or in the dungeons of a fortress. We have stolen a spark of civilisation, and Jupiter punishes us with the torments

The sickly and disheartening tone which pervades Russian literature, has filled the czar with disgust, and gives him the idea, that the civilisation of the West enervates his people, and makes them discontented; that it brings up coward conspirators and noisy demagogues, not men of action and energy. By degrees, therefore, he has changed the traditional policy introduced by Peter I. All the successors of that czar, especially Catharine II. and Alexander I., fostered the introduction of German and French culture; they treated Muscovite nationality with scorn, and opposed the outbreak of Græco-Russian fanaticism. Their aim was to be 'enlightened despots,' carrying on a patriarchal, paternal government, as mild and wise as that of any of the Western powers. They professed to be the friends of the wise men of Europe, and to adopt their liberal principles. Alexander even went so far as to acknowledge, in theory, the superiority of the constitutional form of government, and pleaded only the present low condition of his people in excuse for withholding from them a parliamentary representation. To engage the assent of England to his possession of Warsaw, he willingly granted a constitution to the Poles, and proudly pointed to Poland as to the forerunner in emancipation of Russia Proper. And those declarations were not altogether a tissue of falsehood. Catharine and Alexander really believed they were educating their people for freedom; for these sovereigns agreed with the theories of the Encyclopedists and the Doctrinaires; they had not yet come into collision with constitutionalism, and their authority was never hampered by the people. But Nicholas is a strong-headed, stiff-necked man, and the conspiracy of Pestal and Muravieff, which endangered his throne and life immediately upon his accession to power, gave him the first dislike to the ideas of the West. He quelled the outbreak in his capital by his courage and presence of mind; he destroyed the riotous regiments by grape in the streets of St Petersburg, and he appeared personally in the heat of the battle. His hatred against constitutionalism became soon apparent in Poland. The Diet was dissolved; the working of parliamentary government was first insidiously, then violently destroyed; and when the Poles, elated by the triumph of the French Revolution in 1830, rose in arms, he refused to enter into any negotiations with his rebel subjects; but defeating them after a severe contest, he banished those whom he could not trust. But so far from re-establishing the constitution, he even forfeited the Russian pledges of the treaties of 1815. He annexed the kingdom of Poland to the Russian Empire; whilst, according to the European compact of Vienna, it was to remain nationally separate from Russia, though subject to the czar. Thus he affronted all Europe; but England and France did not call him to account, either for the extension of his despotism, or for the infringement of treaties. His energy had triumphed over Russian conspiracy and Polish insurrection, and over the awe with which politicians looked upon the treaties of Vienna, as upon the basis of European international right. Can we wonder, therefore, that he despises constitutionalism and liberalism, and all the ideas of freedom that are held sacred in Western Europe? and that he believes that the effete nations of the West cannot be dangerous to him? He relies entirely upon his own rare energy, of which he gave a most appalling proof in 1831.

'Whilst the cholera was raging at St Petersburg,' says Count Gurovski, 'the lower classes in some way took it into their heads that the epidemic was generated by poison thrown into the wells by Poles. The rumour attained wide credence; and the peasants, to the number of some 80,000, rose, and wild with rage, paraded the streets, assassinating every foreigner they met. They assembled finally in the Place Siennaia, and with

capital with rebellion. This was so much the more to be dreaded, as at the moment there were no troops at hand. While the riot was at its highest pitch, and the excitement most dangerous, the emperor was seen approaching, accompanied by a single aid-de-camp, and followed by hardly a hundred Cossacks. He moved on slowly and steadily, through the incensed mob, to the very centre of the insurrection, and there looking steadfastly around, with undaunted gaze, he cried, in tones of thunder: "Down upon your knees! Upon your knees ask pardon from your God—you must expect none from me!"

"The immense *prestige* which surrounded Nicholas at that time, combined with such an exhibition of daring, together with the effect of the mighty and sonorous voice, struck the insurgents with such awe that they with one accord knelt down, and offered no resistance, while a few of the Cossacks seized and bound many of their number, and flung them like so many animals into boats, by which they were transported no one knows whither. The rest dispersed in terror, and the rebellion was quelled as if by enchantment.

"Did the sovereign in this moment of success draw any instructive lesson from that scene? Did he learn that masses may be governed by moral power as well as by brute force? Not at all. On the contrary, he drew the conclusion that they must always be ruled by terror; and the idea remained as strange to his mind as before, that if his people were still in their infancy, and the chastisement of the rod therefore sometimes necessary, it was his imperative duty, as a father, to make that childhood as happy as possible. He has spent this mighty energy of character in theatrical shows, never employing it against monstrous abuses, or in giving a moral and economical tendency to his administration. He has rather played with his power than laboured with it for the accomplishment of grand and beneficent ends. Thus history will speak of one as a great actor, who might have been a great man but for the want of a true understanding of the idea of good.

"Yet his conduct on the occasion referred to was the finest act of his life, when seen from his own point of view; it aroused the enthusiasm of all who beheld it, even my own—and I feel rather reluctant to confess enthusiasm upon such a subject. I must admit that I was struck with admiration—a confession I make the more willingly, as it may seem to attest my impartiality when I act the part of the Slave in the train of the triumphant Cæsar, crying "Cæsar, thou art but a man!" The desire to be accurate in my sketches, forces me to bring into juxtaposition with the above anecdote one of an opposite character—the reverse of the medal.

"On one occasion, the emperor's frowns and the contracted muscles of his face announced an approaching outbreak. No cloud of sedition had risen above the political horizon, no sign of public tumult appeared, and Prince Dolgorowsky, descended from the princely house which founded the city of Moscow, who was with him, anxiously awaited the thunderbolt of the imperial ire. "What is that?" cried the czar to the prince in the awful tones of the Place Siennaia, as he pointed to a spot upon the table-cloth! The prince remained silent, and was respectfully retiring, when the emperor, as little touched by the respectful submission of the courtier, as he was formerly by that of the peasants, kicked him—him the *grand écuyer* of the court, the most important personage of his suite, and one of the first dignitaries of the empire!"

From the time of the Polish war, he met no more with any serious resistance, either at home or with foreign powers. He could, therefore, for a score of years, pursue his policy undisturbed by the policy of the West, which saw in him the protector of stability, and of the monarchical principle. His home-policy was, to wean Russia from Europe, to make her

independent of Western ideas and Western civilisation. The ties of faith connected a considerable portion of his subjects with Rome and Germany; he, therefore, unmercifully and unrelentingly oppressed Roman Catholicism in Poland, and Protestantism in the Baltic provinces. The peasants were allured to the Eastern Church by promises of emancipation; the higher classes, by promises of court favour. Religious toleration, which, under the Empress Catharine and Czar Alexander, was one of the leading principles of Russia, gave place to the most shameless system of proselytism. The Protestant missionaries were expelled; the United Greeks, mostly White Russians, were forced by violence to renounce their spiritual allegiance to the pope; and orthodox colonies were sent into Poland, where the confiscated estates of the Roman Catholic nobility, implicated in the revolution of 1831, were conferred upon Russian generals. But even the few Germans who, in this way, had become Polish landed proprietors, had to pledge themselves to bring up their children in the bosom of the Eastern Church. By and by, the German element in bureaucracy was discarded, and Muscovites obtained the command in the army and in the chief offices. At court, the Russian language supplanted the French, by command of the czar, although he himself never was able to learn it correctly enough to write it. The permission to visit foreign countries was restricted to the high aristocracy; difficulties were thrown in the way of foreigners, in order to deter them from travelling in Russia, the interior of which became soon as difficult to penetrate as the interior of China. Nicholas, indeed, has in many respects adopted the policy of China; not for defence, however, but for aggression.

In the character of Czar Alexander, there was an unmistakable vein of religious mysticism; with Nicholas, it has become glowing fanaticism. Immense and uncontrolled power has always had a tendency to madden the men who hold it. Tiberius, Caligula, Nero, Commodus, Caracalla, all of whom began their career honourably, are instances of this fact, which obtains a new confirmation from the lives of the Russian emperors. The great misfortunes of Alexander, by humbling his mind, saved him from insanity; but the uncommon prosperity and good-fortune of Nicholas have overpowered his self-control. He earnestly believes himself to be the chosen engine of Providence for maintaining the divine right of kings, and for extending the orthodox faith. Western Europe—according to him, a prey to infidelity—must be saved by him. For Protestantism, he has no respect: it is only a different form of infidelity, which cannot impart firm faith. He judges thus from experience. During his own life, his family has been allied by marriage to Protestant princesses of Württemberg, Prussia, Sax-Coburg, Saxe-Weimar, Mecklenburg, and Hesse; and not one of those princesses, virtuous as they otherwise are in their private life, could resist the bribe in the form of the hand of a Russian grand-duke. They have all abjured their religion without reluctance: not one of the Protestant princesses of Germany has ever refused a Russian grand-duke, although she knew that she had not only to profess a different creed, but solemnly to accuse the faith in which she was brought up, and in which, under other circumstances, she would have died. Hence Nicholas despises Protestantism just as much as he hates Roman Catholicism. According to him, the Russian Church alone, of which he is the chief, leads to salvation, and preserves the people from revolution, since it inculcates veneration of the czar next to the worship of God. The last ten years have increased his religious fanaticism to the utmost. Religion is for him no longer a tool of despotism—he believes in his divine calling as viceroy of the Almighty on earth; he prostrates himself with real devotion before the shrines, and kisses the images

of the 'mother of God' with unfeigned fervour. His language becomes scriptural; and when, in his late manifestoes, he appeals to God in the words of the Psalms, it is not an artifice for raising the spirit of the people—it is really the expression of his faith.

Still, he has not been able to inspire the higher classes with the same fanaticism. That they do not understand it, is because they do not feel it. It is the unhaven classes, not yet tainted by French and German ideas, who respond to the fanatical appeals of the czar. They hate Western civilisation, because they hate its representatives—the landed gentry, and the government officials; the emperor, they think, is to destroy the whole work of a hundred and fifty years, and to return to the old Muscovite policy, abandoned by Peter and his successors. It is, therefore, with frantic enthusiasm they hear that their czar is standing up to fight the war of the double Cross against the Crescent—the latter supported by schismatic Rome, and infidel France and England. The present war becomes, therefore, a holy war for them; and whatever may be its issue, it will remain a great landmark in the history of Russian civilisation. The old Muscovite spirit, compressed for a hundred and fifty years, is now roused against the influence of Western ideas. It would be strange to expect that such a struggle could last but for a short time, and pass over without changing the face of Russia.

#### THE LAST OF THE QUESADAS.

It may be that the domestic life of Spain is, in the aggregate, as civilised and commonplace as that of Great Britain; but certain it is that incidents therein are not unfrequently brought to light which more resemble creations of the Radcliffe school of novelists, than the sober realities of the actual world. Of this kind is the recent story of Garcilas de Quesada, a young Catalan gentleman, which, in its material parts, has been judicially verified before the Spanish tribunals.

Garcilas de Quesada was, it seems, the sole surviving representative of a long line of ancestors, whose historic glories reached as far back as the days of Pelayo, and the first efforts to rescue Spain from the Moslem yoke, originating under that renowned leader, in the Montañas de Asturias, of which birthplace of Spanish independence the founders of the Quesada family were natives. Unfortunately, the heritage bequeathed the last of the race by eleven hundred years of glory, consisted of little more than the intense family pride engendered by those historic centuries, and an ancient castle, near Cardoña, in Catalonia, which time and violence had reduced to pretty much the condition of its owner—that of a gloomy, repellent ruin. The naturally arrogant disposition of the young man was fostered and inflamed by the teachings of his mother, who died a few months after he attained his majority; and it was said to have been early determined between them, that unless the young Garcilas could espouse wealth in his own rank, the superb line of the Quesadas should end with him, whilst yet unmingled with and uncontaminated by the common yarn of plebeian life. This preposterous arrogance gave birth, after a time, to an immitigable hatred of one particular person; chiefly, in the first instance, because of the afflicting illustration which the position of that person afforded of the wiser course pursued by his family, the De Velascos, who, in the matter of patrician pretence, might have held their heads as high as the De Quesadas.

José de Velasco, on succeeding to his inheritance, having found himself, like many other Spanish hidalgos, and even grandees of modern times, without the means of supporting his hereditary rank, at once resolutely brushed aside the cobweb prejudices that would have barred his path to fortune through the avenue of trade, and engaged, with remarkable energy, in the

salt manufacture, carried on in that part of Spain. Success rewarded his exertions, and its visible signs deepened, by contrast, the gloomy aspect of decay and ruin presented by the formerly rival family of the Quesadas. The ancestral mansion, once in as dilapidated a condition as the hereditary De Quesada 'castle,' was thoroughly restored, furnished, and decorated; the menial establishment, which had dwindled to two or three ill-paid, ill-clad servitors, was recruited up to a handsome complement; Señor Velasco's children—he had dropped the *Don* and the *De*—were carefully educated; and when his son, Alonzo, returned home in 1847 from the university of Toledo, he was pronounced by general consent to be the handsomest, best-dressed, best-mounted, and altogether the most generous and accomplished caballero of the neighbourhood for many miles around. For this young man, Garcilas de Quesada conceived from the first a violent dislike, which, the passing years bringing increased sunshine and splendour to the Velascos, and only clouds and gloom for him, exasperated to the deadliest hate. It was also said, that De Quesada had been for a time shaken in his resolve of perpetual celibacy, except under the before-named conditions, by the charms, personal and pecuniary, of Teresa Velasco, and that he attributed the repulse that had met his condescending advances towards a *mésalliance*, as he deemed it, with a family whose head had degraded its escutcheon by stooping to the status of a salt-contractor—to the opposition of the young lady's brother; his personal pride causing him, no doubt, to ignore the possibility of Teresa Velasco's declining the honour of his hand by her own choice. Some heedless expressions reported to have been made use of by Alonzo, relative to the moth-eaten dignity and poverty-stricken pride of his sister's rejected suitor, confirmed this impression, and led, moreover, to a duel with swords, in which Garcilas de Quesada was worsted, and owed his life to the forbearance of his triumphant adversary.

For about three years after this, no further intercourse took place between the young men, Garcilas de Quesada during that period being rarely seen out of his crumbling castle, where he dwelt in idle seclusion, his sole attendant one Gil Polo, who was born, bred, wedded, widowed, and hoped to die and be buried within the now much circumscribed precincts of the domain. At length, in the early part of 1850, when in his thirtieth year, a circumstance occurred which drew him forth once more into the thinly scattered society of the neighbourhood. This was a confident rumour of the approaching marriage of Alonzo Velasco with Isabella Riogos, a lady he had met with in Madrid, and to whom, as being neither distinguished for wealth nor birth, the elder Velasco and his wife had strongly objected, till subdued into acquiescence by the passionate solicitations of their son, who loved the beautiful Andalusian with a fervour remarkable even in the love-disposing clime of Spain. It was, as the sequel proved, the knowledge of this fact which determined and hastened De Quesada's reappearance in the tiny world which circled his solitude. He was kindly received by the Velascos, who, indeed, had never borne him serious ill-will; and had it been otherwise, his changed appearance, indicative not only of feeble health, but in the gray-sprinkled hair and stooping form, of premature old age, must, in generous minds, have converted any adverse feeling into kindness and compassion for one so early and untimely wrecked in the voyage of life. Isabella Riogos had arrived at Cardoña, on a visit to a relative, before the parental obstacle opposed to her union with Alonzo Velasco had been removed, and there it was since settled she should remain till the magic power of the wedding-ceremonial entitled her to a permanent home in the comparatively splendid abode of the Velascos. Garcilas de Quesada met her

there frequently in the interim; and although he could not avoid being struck with her singular loveliness, he paid her, it was afterwards remembered, but scant attention except when Alonzo was present, and then, as it seemed, merely by way of complimentary admiration of the enchanted lover's choice and taste. He and Alonzo Velasco soon became exceedingly intimate—so much so, that De Quesada consented to officiate as the bride's father at the marriage, which, it was arranged, should take place on the 12th of May 1850.

The bridal-day was distant only about a week, when thunder fell from the brilliant, unclouded sky. The Velasco family, the Lady Isabella Riogos, Garcilas de Quesada, who had joined them about half an hour previously, Dr Zorilla of Cardoña, and other friends, were enjoying themselves *al fresco* in front of the family mansion, with song and dance, when Alonzo's horse galloped up to the gate, covered with foam, panting with exertion, and *riderless*! The alarm and commotion were instant and intense. Alonzo, who had set out early in the morning to transact some business for his father at a salt-establishment near the Albufera de Valencia, had been expected to return several hours before, and it was now, of course, apprehended that some terrible accident had befallen him. But a few minutes had elapsed ere Señor Velasco, Garcilas de Quesada, Dr Zorilla, and several other gentlemen, rode off in anxious quest of the missing horseman; but the morning dawned upon their fruitless search, no tidings whatever having been obtained of the unfortunate cavalier, except that he had left the salt-works in time to have reached his home at least two hours before his horse arrived there. Quesada's house or castle was about a league distant from the residence of the Velascos, and not far out of the track the searching-party had been vainly exploring; and he proposed that they should rest there awhile before resuming their inquiries. The invitation was accepted the more readily by the grief-bowed father and his friend Dr Zorilla, that neither could divest himself of a haunting suspicion that Alonzo had met with foul play at the hands of De Quesada. Nothing, however, was observed in that gentleman's dreary abode, nor in the stolid, careless aspect and demeanour of its only other habitant, Gil Polo, to strengthen that suspicion. De Quesada himself appeared to be much and naturally affected by the distressing catastrophe; and before long, it was generally concluded that the young Velasco, though an excellent rider, must have been thrown from his horse, and hurled down one of the narrow and unfathomable fissures of the Sierra over which he was passing. For, after all, argued the Velascos with their more intimate friends, and notably with Dr Zorilla, what adequate motive could there be to prompt a man, himself apparently on the verge of the grave, to the commission of so foul a crime? There was no question now of the hand of Teresa Velasco, who had been long since married, and settled in a distant part of Spain; De Quesada was not in love, it was quite clear, with Isabella Riogos; and it was surely hardly credible that the slight quarrel which had occurred three years previously, could still rankle with such deadly power in his breast as to urge him to avenge the fancied wrong or insult he had sustained by murder!

This reasoning was scarcely satisfactory, especially to Dr Zorilla, who thought he could read De Quesada's mind and disposition much more accurately than the others; but days, weeks, months passed away without throwing the faintest light upon the matter, till near the middle of October, when a strange freak of De Quesada's, viewed in connection with subsequent information, revived, and in some degree gave form and colour, to the strong though undefined suspicions of the Velasco family—with whom, by the way, Isabella Riogos had, since the mysterious disappearance of her

affiliated lover, constantly resided. Garcilas de Quesada, who had shrunk back to his former gloomy seclusion, all at once startled his neighbours by issuing numerous invitations to a grand *gala*, to be held at his residence on the 17th of October, in celebration of the inviter's thirtieth birthday. The Velascos excused themselves; but the invitation was accepted by a considerable number of persons, who reported that the festival had been a joyous one—had gone off with much éclat, and must have cost the giver at least a half-year's revenue. This unaccountable extravagance on the part of an impoverished and dying man would perhaps only have lived in the gossip of a few brief days, but for the receipt of a letter from an acquaintance at Madrid, enclosing a paragraph, dated about a fortnight before, and cut out of the *Heraldo* newspaper of that city, which set forth in stately terms, that the for some time contemplated marriage between Don Garcilas de Quesada and the beautiful Señora Isabella Riogos, would, it had been decided, be celebrated on the 17th of October! The lady's correspondent added, that several paragraphs, to which she had given no credence, had previously appeared in the same paper, hinting, not at all obscurely, to persons acquainted with the parties, at the probability of the event at last positively announced. The writer was desirous of ascertaining if the statement enclosed—a very surprising one to her—was correct; and if so, she of course congratulated her charming friend upon the alliance she had contracted, all the more cordially, if the paper was also right in stating, that Don Garcilas had lately succeeded to a large property, and had quite recovered his health.

A tumult of wild conjecture, doubt, and apprehension arose in the minds of those to whom the letter was read; and one suggestion, half hinted by the Lady Isabella, and grounded upon the coincidence of the day of marriage named by the *Heraldo* with that of the *gala* given by De Quesada, struck them all as at once so likely and so terrible, that Señor Velasco's first fiery impulse was to set forth immediately and procure judicial assistance, to break into and ransack the suspected residence. A few moments of calmer reflection, however, sufficed to shew him that he had no tangible grounds, or at least none that the law would hold valid, for preferring such an accusation against De Quesada, whose shield of nobility, rusted and worm-eaten as it might be, still presented in Spain a strong defence against any but the weightiest charges and the clearest proofs.

The family were still anxiously pondering the most advisable course of action, when Dr Zorilla was announced. Before the new-comer, who appeared much excited, could open his mouth, the letter which had created such a panic was thrust into his hand, and his opinion thereon eagerly requested. Dr Zorilla's agitation visibly increased as he read; and he had no sooner concluded his hasty perusal of the important missive and enclosure, than he exclaimed: 'This but confirms my apprehensions; and I have to inform you, that whatever guilty knowledge Garcilas de Quesada may possess relative to your son's death or captivity, will in a few days be buried with him in the grave. He burst a blood-vessel in the lungs on the night, I am told, of his grand *gala*,' continued the doctor, breaking in upon the clamour of surprise which arose from his auditors; 'but I was not called in till this morning, when I at once informed him, that nothing short of a miracle could prolong his life beyond twenty-four hours. His pallid features,' added Señor Zorilla, 'flushed hotly, with a sort of fierce dismay as I spoke; and after a few moments of dumb bewilderment, he said in a faint struggling voice: "If that be so, I must bear my doom as I best may. In the meantime, do you, doctor, send me the strengthening cordial you spoke of as quickly as possible, and return yourself as early in the evening as you can." I obeyed him in

both particulars; and when I again saw him, found that he was sinking more rapidly than I had anticipated. It seemed to me,' added Dr Zorilla, speaking with slow and significant emphasis—'it seemed to me, judging by his strangely excited manner and a few incoherent words he muttered, that he had in the brief interval since I left him finally accomplished some great purpose—perhaps if I said *great crime* I should be nearer the truth.'

'Santa Maria!' exclaimed Señor Velasco, 'what terrible meaning is shrouded in your words?'

'He is now entirely alone,' continued Dr Zorilla, with the same significance and solemnity of tone and manner, 'having, which is not the least curious part of the affair, just sent off Gil Polo to execute a trifling commission at a distance of some twenty leagues; and he has requested me to bring him, without delay, a monk in priest's orders from the convent of Los Apostoles, to whom, under the sacred and impenetrable seal of confession, he will doubtless reveal, for his soul's health, what we are all so anxious to be informed of. I need hardly go so far as Los Apostoles,' added the physician with slow, emphatic emphasis, 'for what with the moribund's fading sight, the gloom of the death-chamber at this hour of the evening, and myself being the only attendant, the Señor Velasco himself might officiate as confessor without fear of detection.'

'Heaven forbid!' exclaimed Señor Velasco, crossing himself, and sternly regarding the tempter, who, having served in the French army during the war of independence, was suspected to be something of a heretic, or an *esprit fort*—'Heaven forbid that I should commit such sacrilege! But it occurs to me that Gil Polo, who, I suspect, will not else be seen in this neighbourhood again, ought to be secured.'

Dr Zorilla readily approved of this suggestion, and remarked that it would be as well to bring him at once into the presence of his master; 'for be sure, Señor Velasco,' added the physician, 'that if you ever obtain a clue to the fate of your son, you will do so this night.'

The conference immediately broke up; Señor Velasco, followed by his wife and daughters, hurrying off to arrange for the instant pursuit of Gil Polo: Isabella Riosos accompanied the physician. 'You, lady, I perceived by the flashing of your eye just now,' said Dr Zorilla in a low voice as they passed along the corridor, 'do not, although a devout Catholic, deem it sacrilege to further the justice of God?'

'I do not,' replied Isabella Riosos, 'especially as it is possible I may discover that—that—I hardly dare breathe the hope that trembles at my heart.'

'That you may discover,' said the physician, 'if you have firmness enough to stifle all emotion that may betray you till you have heard De Quesada's confession to the end—that Alonzo yet lives, and how he may be restored to the world and you? That is a quite possible result—mind, I say possible only, for I have strong misgivings. Still, if you are the brave girl you appeared to be a few minutes since, you will not shrink from the venture.'

'I will not shrink,' responded Isabella Riosos; 'and adamant shall not be firmer than I, till all is revealed. But pray,' she added quickly, 'step into the courtyard, and request Señor Velasco to bring a true priest with him to the castle. We shall either have failed or succeeded by that time, and De Quesada's soul must not flit unshriven to judgment.'

Dr Zorilla smiled, but performed her bidding; and they were soon on their way to the presence of the dying man, the physician silently determining for his part to try what effect a threat of the *garrotte*, coupled with a knowledge of who had been confessing his master, might have upon Gil Polo.

But for the pale, uncertain starlight which served to define the shadows of the cumbrous furniture of the

apartment in which Garcilas de Quesada was breathing out his last of life, and the white face of the dying man himself, Dr Zorilla and his companion would have had no other guidance than the faint voice of the sufferer to his bedside. 'The glare of a lamp,' said the doctor in a sufficiently loud voice, 'would pain the eyes of my patient, and your mission, reverend father, does not fortunately require one. When you require my attendance, be pleased to ring the sonata on the table at your elbow.' He then left the room, and descended the stone stairs with a sounding step, as if to assure the penitent that he was alone with his confessor.

The dying man did not speak, and the impatient listener repeated the first words of the *Confiteor*, as a suggestive invitation to commence. 'True—true,' muttered De Quesada, 'the purpose for which you are here, reverend father, admits of no delay. "*Confiteor Deo omnipotenti*"—Ah, it is long since I repeated those words. "*Confiteor Deo omnipotenti, beatus*"—Memory is failing me as well as sight. Do you, father, say the words, and I will repeat them after you.'

This was done, and the confession went brokenly on. After relating much that the reader is already aware of, relative to the insane hatred he bore Alonzo Velasco, he said that his burning thirst for vengeance during the three years he had feared it to be unattainable, had, he now felt, dried up the fountains of his life. 'Mine was not,' he continued hurriedly, 'a hatred that the mere compassing his death would satisfy. I wanted to inflict a far direr vengeance than that; and his unbounded love of the beautiful Isabella Riosos at last afforded me the means—You start with horror, reverend father, at this avowal, and it is nothing compared with what remains to tell. Yet Holy Church can, we know, at the last moment, if the confession is unreserved—the penitence—Ah, what means that noise?'

The lady's quicker ear had caught the sound distinctly: it was her father's voice in contention with some one—Gil Polo probably. It ceased almost instantly; and De Quesada proceeded, but with a hurried incoherence which shewed that partial delirium already affected his brain. 'Yes—yes, as I told you, I invited Alonzo Velasco to leave the room, and rest here awhile. He little suspected the potency of the pleasant wine he drank, nor how, when he awoke long hours afterwards, it had come to pass that he had exchanged the bridal-chamber he had dreamed of for a stone dungeon—that he was bound in stronger fetters than his lady's arms.'

'Does he yet live?' burst from Isabella's lips in a tone which startled the dull ear of the dying man, and he strove to raise himself in bed, but failed to do so. 'Live!—live!' he muttered, falling helplessly back upon the pillow; 'yes, to be sure—at least he did a few hours ago—where Gil Polo and I know, and we alone. I would tell you, but that it grows colder—darker—colder'—The voice ceased, and Isabella eagerly applied a cordial Dr Zorilla had furnished her with, to the lips of the expiring wretch. It revived him, and after a few moments, he faintly resumed: 'You could hardly believe, reverend father, that the newspapers Gil Polo took him to read should have plunged him into such agonies of rage. The *Herald*, I had contrived, should say that I was about to marry the beautiful Isabella. He seemed at times to have gone permanently distracted—mad; I, unobserved, looking on delightedly the while. Ha! ha! that, if you like, was revenge! What was I saying?—I have it. He began to doubt the truth of the newspaper paragraphs—to hope, almost believe, they were inventions; and then it was I played the master-stroke. The newspaper announced our marriage—*our marriage!*—Isabella Riosos' and mine; and I took care that the rejoicing revelry should convince him that it announced the

truth. Father, his fury was sublime in its wild extravagance, especially, oh! especially when, at the chime of midnight, the loud music played the bridal-air you wot of appropriate to the departure of the wedding-guests. He leaped, danced, raged, and I, too,' continued De Quesada, with kindling animation, 'I too leaped, danced, raged, with sympathetic delirium, till my senses utterly failed me, and I reeled and fell down a flight of steps, bursting a blood-vessel, which at once destroyed the feeble hope I had till that moment entertained of prolonged life.'

'Wretch! fiend!' shouted Isabella Riogos, unable to control her emotions, which was of the less consequence as De Quesada relapsed immediately he ceased speaking into partial insensibility. 'Yet answer—does he live?—or are you in deed as well as in thought a murderer?'

'A murderer!' faintly murmured Quesada; 'why, yes, if the poison I poured into his water to-day can kill!'

The lady's convulsive scream was echoed by the loud voices of several persons hastily ascending the stair. Presently, the door was flung violently open, and gave to view a spectacle so startling as to cause De Quesada to spring up in his couch with renewed life. 'Alive!' he gasped—'alive!' as his fascinated glare rested upon the attenuated, corpse-like features of Alonzo Velasco, visible in the light of the torches held aloft by his father and Dr Zorilla.

'Yes, alive!' fiercely responded Zorilla: 'the pretended poison this fellow, Gil Polo, procured you, was, luckily for his neck, as innocent as water; and'

'Silence!' interrupted the priest brought by Señor Velasco, as he stepped forward and elevated a wooden crucifix before De Quesada: 'an immortal soul is passing. Look upon this emblem of the Eternal's mercy,' he added, addressing the expiring sinner, 'and breathe—think of but one prayer to God.' A gleam of intelligence seemed to flash from De Quesada's darkening eyes, and a half smile parted his lips: the next moment he had fallen back upon the pillow—dead!

### THE RADICAL MEMBER OF SOCIETY.

THE radical member of society, unlike his namesake of the senate, is a very unobtrusive personage. He was made before Adam, and his race has been multiplying on the face of the earth ever since the creation; yet, two centuries ago, men had but just become acquainted with the fact of his presence among them. He dwells familiarly in the midst of us, and yet ninety-nine in every hundred of us go down to our graves without knowing that he is there. He is essential, too, to our being. We cannot do without him, even for an instant. He ministers to our physical wants, renders himself subservient to our enjoyments, and even charges himself with the superintendence of our mental operations. Simple in his habits, and humble in his bearing, he is, nevertheless, a mighty potentate in his way. If the Emperor of All the Russias were to prove his fitness to sit in a high place, by blowing a generation of his fellow-men into dust, our little patient friend would quietly ply his craft, and by the time the autocrat had joined the smoke of his own explosion, and had become ashes with ashes, a new generation of living human forms would fill the vacant place.

The radical member of society is not given to the adornment of his person with factitious decoration, neither does he stand six feet without his boots. This, indeed, is why he is so commonly overlooked, even when in the act of rendering important service to the state. If the truth must be told, he is but a pigmy in stature—so small, indeed, that unless when he chances to have outgrown the ordinary standard of his race, he cannot be discerned by unaided human eyes. He is, in fact, *microscopical* as well as radical. Until the ingenious Robert Hooke had put his apparatus of

magnifying lenses together, to 'pry into all things'—as it has been *judicially*, but not very reverentially expressed—it was not possible that he should be seen. So minute are his dimensions, that a clever hand might put a million of his little bodies to bed side by side upon the face of a shilling. As many as twenty millions, indeed, have been known to be comfortably accommodated within the same area, when the individuals happened to be only dwarf specimens of the race.

The radical member of society has been planned with a view to convenient package, as well as to fitness for active work; hence he is without any kind of awkward incumbrance. He has neither arms, legs, nor head: he is all body, and this body is generally as compact as a dumpling; so that it may be rolled freely about when engaged in locomotive operations, or, even when not so employed, be stored up, as Dutch cheeses are packed away in cellars. He is, nevertheless, very cunningly and beautifully made. His compact body is composed of an exquisitely delicate film of skin, covering a reservoir of rich liquid. Sometimes this skin is defended by a rigid coat-of-mail, spread over it externally; at other times, it is strengthened by a stout lining attached to the inside. In either case, the radical fact, nevertheless, still remains—that our radical friend is a *little bladder* full of fluid. On this account, he has been named by scientific sponsors a *vesicle*, and very appropriate is the denomination: *vesicula* is the Latin word for a little bladder. Many people prefer to speak of the subject of our consideration as a *cell*: *cella* is a chamber where valuables may be stored away. A cellar, for instance, is a place where we pack our wine; but a cellar may be a hole hollowed out in the ground, or it may be a structure built up of walls. Now, our friend is not a hollow space, excavated in a lump of continuous substance: he is really a structure made of walls that have been built up regularly of smaller parts. In each of the twenty millions of bodies that can repose together upon a shilling, there are myriads of little atoms, as they are termed, fixed and fitted together, as bricks are fitted in common buildings. When our vesicle is strengthened and stiffened by outer coatings, or thickened by inner deposits, it may be convenient to speak of it as a cell; but the term must then be understood to comprise both the walls and contents, as well as the chamber or cavity in which the latter are held.

But a bladder is no person: it is only a thing; hence it may be urged we have not at present established any good and sufficient ground for speaking of our vesicular acquaintance in the language we have employed. Our answer is, that we have yet more to tell. The object of our allusions is really a *living* vesicle, and has an absolute personal individuality of its own. He grows from infantile into mature age, arranges the matters of his own internal economy, transacts his own business, and even brings up a family, and manages to get his descendants off in the world at an appropriate time. To make all this as evident to our readers as it is to ourselves, we will drop in upon our friend in one of his favourite places of resort, and spy out his doings by means of our microscope. We need entertain no scruples in committing the act of espionage, for he will be altogether unconscious of our operations: he has no telescope to turn upon us.

In pools of still water—especially if on open moory ground—a layer of greenish, half-fluid, cloudy-looking substance nearly always collects at the bottom. If a portion of this be carefully raised by the hand, or by a net of fine muslin insinuated along the mud beneath, and be then examined by the microscope, it will be found that it is occupied by swarms of minute objects, possessing an immense variety of appearance, and yet agreeing together in certain essential particulars. Some look like little balls; others are elliptical or boat-shaped; others cylindrical, quadrangular, or even

triangular. Some resemble flat circular disks, and are covered by symmetrical patterns worked in lines and dots. Many are beautiful crescents, or yet more graceful spindles, lengthened out and bent opposite ways at the extremities, with a sort of segmoid curve. All of them are, however, hollow cases of thin membrane, and contain inside a clear liquid, in which numerous small granular specks, often of a bright green colour, float. Now, if some of these curious objects be carefully watched for a little time, it will be noticed that they do not remain altogether stationary where they have been placed; all at once, they get restless, and advance by a series of little jerking starts in one direction—then they stop, and return upon their previous course with the same halting gait. Occasionally, some very brisk individual of the community will, in this fashion, make a journey an inch long in a few minutes: the more circumspect travellers take a day to accomplish the same distance.

But if the observation be carried on for a sufficient length of time, it will be seen that these siffl creatures grow as well as move. They get larger and larger, in some cases by puffing out their sides; in others, by extending their length. All the while this is going on, a strange commotion is taking place in their insides: legions of granular specks hurry now this way and now that, until at length a result of all the bustle begins to appear. A thin partition commences to form all round the inside of the case, and creeps onward, step by step, until at last it has divided the original chamber into two perfectly isolated parts. The partition then thickens, and finally splits into two distinct layers, of which the one attaches itself to one cavity, and the other to its neighbour; and thus the case itself tumbles into halves. Each half then grows, until it attains the mature dimensions of the parent, and after this deposits its partitions, and falls to pieces; and so, individual after individual, and generation after generation, are formed.

These little multiplying vesicles—for such the bodies are—acquire the substance that is used in the augmentation of their own dimensions, and in the formation of their partitions, from the liquid in which they are immersed. There are no perceptible openings in their delicate membranous walls; but those walls are, nevertheless, full of inconceivably minute pores, through which liquids can slowly infiltrate. Water will not run through a piece of bladder; but the bladder will, notwithstanding this, soak water up into its substance, and get thoroughly wet throughout. Under this soaking power, if sirup be tied up in a bladder, and the bladder be tossed into a pail of pure water, the water will be drunk in and mingled with the sirup, rendering it thinner and more dilute in consequence of the admixture. Just in the same way, the living vesicles under consideration imbibe the thin fluids in which they float, and mingle the same with the thick rich matters they contain within. They then select from the imbibed fluid, principles that are useful for their constructive work, and reject the rest. This is what the restless movements of the granular specks alluded to above mean. Those little floating masses are necessarily carried to and fro by the arriving and departing currents. In this way, then, our radical member manages to feed himself without either head or hands. He is mouths all over his skin, and is always swimming about in a reservoir of nutritious liquid, which he can appropriate at need.

Every vesicle that falls under observation is not, however, equally fortunate in this respect. Some of the little flattened or lengthened cells have their skins defended by large impervious horny plates, or by flinty shields and mail-pieces applied closely to their external surfaces. These uncovered spaces, for purposes of imbibition, are only left along the margins of the plates, or under holes bored through their dense substance.

When this is the case, it occasionally chances that the insetting or outflowing current of liquid becomes so strong in one direction, that the light vesicle is suddenly pushed before it, just as it has been recently proposed to propel steam-boats by jetting water out from pipes, instead of by the revolution of paddle-wheels and threaded screws. The jerking movements of these rudimentary vesicles are now generally conceived to be, not properly locomotive acts, but simply hints of this nature thrown out to our mechanicians, to show them how to set about their work.

Microscopic living cells of this kind do not dwell in placid pools alone; they love the fresh water which is still and clear to the bottom, and that allows the genial sunshine to penetrate to its utmost depths. But they also abound in all moist situations: they cover the surface of rocks in the sea; they cling to the submerged parts of aquatic plants, both marine and fresh; they cluster in ditches; and wherever running-streams lag by the way, they assemble in crowds. In every trough or cistern where water is allowed to stand, their presence may be easily detected by skilful seekers. Scientific men have called these omnipresent multitudes of self-multipliers by the name of *diatoms*, the epithet being a reflection upon their origin—the word is taken from two Greek terms that signify 'cut through.' Some of the microscopic community that possess angular forms, shew a little inclination to cling together by their corners; these are especially classed as *desmidiæ*, a word derived from the Greek for a chain.

There is one curious fact regarding the constitution of the true diatoms: so soon as their delicate membranes are fully formed, and freely exposed to the influence of the water in which they float, they collect from that fluid minute particles of hard flint, and out of these fashion for themselves solid shields or shells, which they attach to the outside of their bodies, merely leaving narrow grooves and dots of the membrane free from the dense investment, that the liquid nourishment may there still flow through. These flinty shields are so indestructible that they may be boiled in aquafortis, and will come out from the ordeal only the more perfect and clear. Time seems to possess scarcely any power over their forms, for beds of them many feet thick are found lying where they must have been deposited by lakes that have been dried up for thousands of years. Many of them are embossed and worked over by very beautiful ridges, arranged in symmetrical patterns. There are shields of some of the diatoms known as *naviculæ*, which are quite invisible to the unaided eye, and which appear only as thin films, without any discernible tracings upon them, when magnified 150,000 times. But when the magnifying power is increased to some million and a half of times, the film is seen to be entirely hatched over by obliquely crossing lines, like those which engravers execute in producing shadows upon their work. When the amplifying power is raised to four millions of times—for the instruments of modern days can accomplish even this wonderful feat when wielded by skilful hands—those lines themselves are resolved into rows of projecting beads ranged side by side, each separate from its neighbour, and each distinctly raised from the general surface of the silicious film. But each one of these beads must be formed of myriad particles, in their turn quite invisible, even when increased by optical power to four millions of times more than their proper dimensions. There is an infinity in littleness as well as in vastness, at least so far as the capacities of the human lenses are concerned.

These surprising little objects discovered by microscopical research at the bottom of still pools of water, and in other convenient situations, are, then, really living creatures, as wonderfully perfect after their kind as lordly man is after his kind. Each one is an organ or instrument, accomplishing important work by

the transformation of dead matter into its own living structure, and by the production of generations of bodies like to itself, which are to take its place in the scheme of nature, when its frame has been swept away from the scene; hence these lowly receptacles of life are termed *organisms*; and still further to distinguish them from more complex efforts of creation, they are expressively designated *single-celled organisms*. As each cell or vesicle is an organism, so each organ is complete in a single cell. But having determined the fact, that these simple bodies are living organisms, there still remains for consideration the question of what *kind* the life is that they possess. Are they merely single-celled plants vegetating in the water? or are they single-celled animals, endowed with the higher privileges of vitality? This problem has proved a somewhat knotty one to solve. The observers who have studied the diatoms and desmidsæ the most carefully during the last few years, have waged a fierce war over their unconscious forms. Ehrenberg, with a small band of gallant allies, has, on the one hand, claimed them on behalf of the animal tribes, only conceding that they may be designated *animalcules* on account of their microscopic dimensions. He maintains that he has seen them put forth and draw back retractile limbs; that he has watched them while performing distinct acts of locomotion; and that he has fed them with indigo, and noticed the food disappearing into open mouths. Nägeli and Siebold, on the other hand, with a more imposing array of supporters, insist that they are not even animalcules, but only plants; and that the retractile limbs and swallowing mouths of Ehrenberg are merely extraneous particles of solid matter quivering before the alternating currents of liquid setting into and out from the permeable tracts of absorbing membrane. Before we attempt, Jove-like, to hold the scales for these contending heroes, we purpose to shift our position a little, in order that we may perform the service circumspectly, and with a firm and safe support beneath our feet. It will not do, in this iron age, for an arbiter of destiny to stand upon the clouds.

If a careful search is made among the fronds of duck-weed growing in turbid water, instead of in the clear pools in which the diatoms abound, a small speck of transparent jelly-like substance may often be detected clinging to the surface of the green leaves. When this speck is submitted to microscopic scrutiny, it is found to consist of a little bag of limp membrane, containing a quantity of fluid inside. It is, in fact, a vesicle, but it is a vesicle of a very curious kind. Instead of being rigid, and wearing a fixed form, like the diatoms already considered, it is soft and yielding everywhere, and it is every moment altering its shape. Now, it looks like a round ball; now, a little projection is pushed out on one side, like the finger of a glove—the ball rolls after this, and a new finger points in another direction, and the ball is resolved into an altogether grotesque and indescribable object, unlike any other creature discoverable beneath the sun. This very odd concern is called the *amœba* (the 'always changing,' from the Greek word for 'to change'). It also is really a living vesicle; it is a single-celled organism, like the diatoms, but it is unlike the diatoms or the desmidsæ in this particular: it possesses the power of bending, and folding, and rolling its own thin membrane about, which they never do. It moves about, indeed, habitually in search of its food, and it carries on its search in this way: it sets up a current or stream of liquid in its inside, in some definite direction, and before this current its thin membrane is pouched out; the body then falls over after the pouch, and yet another pouch projects. If, during this progress, the point of the pouch gets at any time into contact with a morsel of appropriate substance fit to serve as food, the limp membrane folds itself completely round it, and thus forms a sort of

interior *sac*. It makes, in fact, an extemporaneous stomach, and in this the morsel is digested or dissolved. The dissolved material is then absorbed through the membrane, as any other liquid might be; and the stomach, having accomplished its work, is unfolded to become skin again. Thus the *amœba* furnishes the curious spectacle of a living creature rolled along in search of its food, by means of internal streams that push its limp skin before them. It is, in fact, a living vesicle, furnished with locomotive powers, and travelling about in search of food, instead of merely absorbing what chances to come into contact with its skin, as is the case with the diatoms. Now, this locomotive cell is unquestionably an *animal organism*: it certainly belongs to Ehrenberg's animalcule tribe. It is in the scale of animate creation what, in all probability, the diatoms and their congeners are in the vegetable creation. It is the radical member of society in his animated garb, as the diatom is in his vegetative form. The primitive organism of animal life is a limp, restless, changeable structure. The primitive organism of vegetable life is a rigid, changeless, and immovable structure. The soft, unarmed *amœba* is the type of one, and the stiff, mailed diatom is the type of the other. Free mobility in the membrane of the vesicle at once marks it as belonging to the animal domain. The mere power of moving from place to place is not sufficient for the purpose, for vegetable cells often do change their position under especial circumstances; but when they do so, they move, as a whole, without bending or altering their shapes, as the *amœba* has been described to do. It may also be added, that when vegetable cells travel, they never avoid obstacles that chance to be in their way: they go on in straight lines, until they knock against some rock ahead, and they then stick there, without any attempt to extricate themselves from the difficulty. Animalcules, on the other hand, steer themselves adroitly round whatever chances to lie across their path. Animalcules are locomotive by design and through intent, but vegetable cells are never locomotive excepting from some extraneous or accidental influence.

Some very curious forms occur among the active animalcules, which, at the first glance, appear to be wide departures from the simple vesicular type of being instanced in the *amœba*, but which are really, after all, very slight deviations from that condition. These animalcules look like bags with open mouths, instead of being closed bladders, and they take their food into their interior cavities by an apparent act of swallowing, and retain it there until digested. In these cases, however, the interior cavity is merely a fold or pouch of the general surface thrust inwards. If, when the *amœba* has folded its membranous wall round some morsel of food, it were permanently to retain the form it had thus taken, leaving an open mouth where the inward folding occurred, it would exactly represent the state of the bag-animalcules. Some of those creatures, indeed, have been turned inside out—the skin being made to take the place of stomach, and the stomach of skin, and no harm has resulted to their economy.

We have now shewn that the little vesicular bodies we have been contemplating are living structures: they prove themselves to be living by the performance of five distinct and wonderful operations, which dead matter can never accomplish: they select certain nutritious principles that are suitable for employment or building purposes; they transform these principles into membrane like that of which they are themselves composed; they appropriate this membrane to the enlargement of their own bodies; they vitalise it at the same time—that is, they enable each addition made forthwith to take upon itself the same selecting, transforming, and vitalising functions; and they multiply their forms by falling to pieces, and contributing each piece as the foundation of a new growing organism,

capable of becoming in every respect like to themselves. All these five things every little diatom, every amœba, every individual of an allied host of creatures, is able of itself to perform. As, therefore, these microscopically minute bladders must be assumed to be the *radical*, or, to use a synonymous term, the *primitive* form of living structure—we can hardly conceive any other form either smaller or simpler—we are in a position to state that the radical or primitive attributes of life, those characteristics by which it is distinguished from mere physical existence, are the capacity to select, transform, and vitalise matter, and the capability to extend the dimensions of its own structures, and to reproduce its kind.

But we have yet to make good our assumption, that little living vesicles are radical members of society as well as the radical forms of life. This we shall now be able, in a very few words, to do. If we leave placid pools and stagnant ditches, and attack with our 'prying' instruments the fastnesses of vitality—such noble structures as the trees of the forest, and the beasts of the plain—we shall find that they, too, are but heaps of microscopic vesicles: we shall see cells in the green leaf, in the solid wood, in the coursing blood. Man himself is but a pile of vesicles. By the microscope, we detect evidence of their presence in bone, in flesh, in fat, in veins, in skin, in hair, and, in short, in every organ and in every piece of apparatus of his wonderful system. The fact is merely, that in these complex productions of life, the successive generations of vesicles that are formed out of the primary ones, are attached together to build up the several parts of the connected frame, instead of being scattered abroad as a swarm of independent creatures, each being then altered in character and form subsequently to its first construction, to render it suitable for some special purpose in the organisation, or for some particular position in the fabric. All plants, all animals, and even man himself, are made up of multitudes of little vesicles; and of these vesicles each one is a living structure, capable of selecting, appropriating, and vitalising its food, and of growing and reproducing its kind; hence there is in all these creatures a vesicular life, which sustains the life of the individual, and ministers to it, so to speak. This vesicular life is called *organic life*, because it carries on all the work of organisation, and is quite distinct from *animal life*, which is made up of various powers of motion and sensation. Plants possess only organic life. Animal life is the life of the complex individual viewed as a whole, rather than the life of the component cells; still, it is supported through the activities of those cells, and comes to an end the moment the cell activities are stopped; hence the radical form of life is also the radical member of society.

## A HINDOO WEDDING:

A RECOLLECTION OF 1805.

It is well known in England that the Hindoos marry or are betrothed very young; and also, that the fair sex is so confined to the house, that the young women, after they are ten or twelve years of age, see no male persons, not even their own brothers. The houses of wealthy persons are all constructed so that they have no windows that look into the streets, but are built in squares, the windows looking into the interior. The only entrance is by one large gate, where the *doorwan*, or porter, sits night and day, for he eats, drinks, and sleeps inside the gate; and when he has occasion to go to the river to bathe, and say his prayers—which he does regularly every morning—he is relieved by a trustworthy person, so that no one can go in or out without the fact being known. All Europeans of any note also keep a *doorwan*, who, when any stranger goes into the house, calls after him: '*Bhar Ca—Sahib, iah,*

*chubber, di joe;*' that is, to inform the servants of the house that a stranger gentleman has gone in, and to let the master know. By this, you will see the place is strictly guarded; and it is very difficult to get in, except at the Durga Poojah, and other great holidays, when three sides of the house are opened to strangers, and the women of the family removed to the *zenana*, or the side of the square opposite the gate, the windows of which are generally glazed with ground-glass, that gives light, but cannot be seen through. The great baboos have their children betrothed when very young, and as they are never allowed to see strangers, the father looks out for suitable matches for them; the mothers are out of the question, for they see no person but their husbands or servants. The fathers, when they have sons or daughters come to the age of betrothal, which is generally when the boy is twelve, and the girl eight or nine, look out for a match for them in some respectable family of their *own caste*, and who can likewise give a suitable portion with their children. There are also female agents, or match-makers, who go about under pretence of selling fine dresses, clothing, or trinkets, and who make a profitable trade in looking out for good-looking girls, and recommending them to the mothers who have sons come of age. After they have made an eligible match, the fathers make a bargain for the sums that each is to give to the children to set up housekeeping, and fix the time when the wedding is to take place. To make the arrangement sure, a native *vakeel*, or lawyer, is employed to draw up the deed, with a penalty in case of failure. When the wedding is to take place—that is, when the young couple are to live together, which is, generally, when the boy is eighteen, and the girl fourteen—all their male relations and acquaintances are told there will be a great *tamassa*,\* or procession at the wedding, and they are invited to attend. If the boy's father is rich, he will spend a great deal of money on this fortunate occasion.

I remember, in 1805, a very rich baboo, with whom I had frequent dealings, and who made all his money by trading with Europeans, having a grand *tamassa* at his son's wedding, which lasted three days. There was a gorgeous procession through the streets of Calcutta during that time, at which not less than 1000 hired persons assisted; and besides other devices, there was a large mountain made of bamboos and paper, on which were placed numbers of trees and bushes, with wild animals and birds, from the elephant and tiger to the squirrel and mouse, and from the cassowary (the Indian ostrich) to the wren—all made of the same material, and painted to the life. This was carried through the streets on the heads of probably not less than a hundred men, a curtain hanging down to prevent the bearers from being seen. A guard of a hundred men in uniform went before, and the same number followed, all with imitation muskets on their shoulders, covered with gun-cases of red and yellow cloth, and intermixed with numerous bands of drums (tom-toms) and other instruments. The bridegroom in his palkee, finely dressed in gold embroidered muslins, carried by four men, and the girl in her dowlah, closely covered up with cloth, followed close in the rear, guarded on each side by a number of men dressed as sepoy. I think the procession was a quarter of a mile long in the broad streets, and half a mile long in the narrow streets, where the black population live. After much show and parade of this kind for three days, it was intimated when the marriage-ceremony was to take place; and as there is often a great deal of money given away among the poor at this time, there is always a great attendance of such wedding-guests. The marriage-ceremony is performed in the square of the father's house by a Brahmin of high caste, who pronounces

\* *Tamassa* means a great deal of fun.

an elaborate harangue on the good qualities of the bridegroom's and bride's father; then on those of the bride and bridegroom themselves; and then a prayer that they may prosper, multiply, and replenish the earth, there being great mourning in the house if there are no children even in the first year.

The time is now come when the bridegroom first sees his bride. They having been placed in their palaces under the zenana—that side of the square where none of the company are—the bride is closely covered up in her dowlah, and the Brahmin, holding a looking-glass in his hand, gently opens the cloth, and, holding the mirror in front of the bride, desires the bridegroom to look in it, and say whether he is satisfied to take this lady for his wife. If he says Yes, then the ceremony goes on, and is concluded with a grand invocation to the gods, ending with a great huzza, and mighty drumming of the tom-toms. During the noise, there is generally a scramble in the streets for money, which is scattered to the poor. The company then disperse; the square is searched by the doorwans; the door is locked; and the next day that part of the town is as quiet as if nothing had happened. But if, on the fateful question being put, the bridegroom says No—a thing which rarely occurs—then there is a stop put to the whole proceedings; the company is dismissed, and the girl taken home to her father, who returns the duplicate of the marriage-deed. I have only to add, that it is not easy for a stranger to get in to see one of these marriages. I happened to have a Brahmin of high caste as a writer in my office, who went with me on the occasion referred to, and he had only to hold up his finger to the doorwan to procure my admission. I threw the doorwan a rupee as I passed, which I knew was expected. There were a number of Europeans there, but as they were all dressed in white cloths, with hats off, they attracted little observation.

#### JOTTINGS FROM THE CAPE.

THAT the columns of a newspaper, when read with due appreciation, may be used as a storehouse of information concerning the usages and general progress of society, is an opinion we have before expressed, and endeavoured to illustrate, in a short article a few months ago.\* Of course, the home and foreign news, the debates, the markets, the meetings, the 'leaders,' the 'court circular,' the opening of new railways and the launching of new ships, the making of monster wire-ropes and the laying down of interminable electric-telegraphs, the bankruptcies and insolvencies, the theatres, the concerts, the Exhibitions, the strikes, the lock-outs, the new patents, the scientific discoveries—these not only tell of the progress of society, but they are the best register of such progress. It is not of this, the main body of newspaper matter, we speak, but of the advertisements, the voluntary announcements of those who, for the most part, do one of three things—offer commodities in exchange for money, offer services in exchange for money, or offer money in exchange for services and commodities.

We have before us the *Mercantile Advertiser*, or *Shopkeepers' Journal*, a newspaper published at the Cape of Good Hope on Mondays, Wednesdays, and Saturdays. It is one of those journals which are maintained chiefly by the money received from the advertisers; it is distributed gratuitously in Cape Town, on board ships in Table Bay, and at Rondebosch, Mowbray, Claremont, Wynberg, Simon's Town, Stellenbosch, and Paarl—all places near Cape Town; while it is distributed in the country districts of the colony at a charge of 1d. per number—intended, apparently, to cover the expense of conveyance. Our

number is of the date February 1, 1854; but there is no reason for believing that this differs in character from any other which might have fallen to hand. There are six pages of tolerably large, but, as is frequently the case in colonial newspapers, very thin paper.

The first fact which strikes the eye is, that many of the advertisements are in Dutch; while some are printed in two different parts of the paper, one in English and one in Dutch. This gives a significant reminder of the nature of the population. We know that after the Portuguese had discovered the Cape of Good Hope—the 'Cabo Tormentoso' of Bartholomew Diaz—the Dutch effected a settlement there about the middle of the seventeenth century. They easily mastered the mild and timid Hottentots, and gradually extended their settlements into the interior. Thus matters remained until 1795, when the English captured Cape Town; at the Peace of Amiens, it was restored to the Dutch; but in 1806 the English again took it, and it has ever since remained in our possession. The Dutch settlers have not been disturbed in their holdings, except by Caffre incursions; and a mingled society has grown up, in which the English and Dutch elements take part. In all probability, the two nationalities remain distinct, under circumstances where good-fellowship would advocate a closer union; but still it cannot be otherwise than that commercial and social relations must spring up in a colony so situated.

The shipping advertisements are certain to occupy a prominent position in a Cape Town newspaper, situated as the colony is on the high-road from the Atlantic to India and Australia. There is an Australian screw advertised, as about to drop in on its homeward trip; and there are many of the steady-going, old-fashioned Indiamen, such as were built before these our clipper-days. There are ships, too, bound for Melbourne and the Diggings. A circumstance of much local interest is the establishment of routes to South African ports of which we have only a slight knowledge in England. There is one ship, for instance, to Mosseel Bay; another, to Port Elizabeth; a third, to East London; a fourth, to Port Natal; while St Helena and Ascension Island, in their Atlantic loneliness, have a sprinkling of ships from the Cape.

The general dealers have, of course, their miscellaneous advertisements, relating to miscellaneous assortments of goods. A little of the quackery and puffery style has crept into South Africa, though far below the level in this respect of the 'old country' and of the United States. We here copy from the *Traveller's Union*—a weekly newspaper, published in one of the country districts of New York state—an advertisement from a general dealer, which throws into the shade all Cape Town advertisements:—'Bennett deals in any and every thing. If you want a good coat, he can show you one cheap. If you want a hat or cap, he is at hand. Boots and shoes—his stock is complete. Family groceries and good flour is what he prides himself on selling low. Butter always on hand; and if you are out of potatoes, he has got them. In fact, he has the goods just what you want; and he wants to sell 'em. So call.'—There is a grandeur of decision about this, which no inferior genius could arrive at. Nevertheless, the Cape Town advertisers know how to announce their goods to the best advantage. It is, however, more interesting to note the different character of the goods received from England and from America. One dealer announces for sale, as recent arrivals, pianofortes, oilman's stores, ale and porter, fish-sauce, crushed and loaf sugar, Price's patent candles and night-lights, soap, leather, Blucher-boots, ironmongery, iron bedsteads, plated ware, patent fuel, paints and varnishes, doekskins and vestings—a miscellaneous lot, truly! An American assortment, advertised by another dealer, is also miscellaneous; but it is noteworthy in respect to the eatables, and to the large number of manufactures

\* 'The Columns of Society,' No. 525, C. E. J., p. 450.

in wood which it comprises, quite a characteristic in some of the states of America:—Prime and mess pork, hams, oysters, and peaches, cheese and butter, common and Baltimore chairs, cane and wood-seat chairs, pails and tubs, axes and axe-handles, hatchets, reaping-machines and ploughs, pipe and hoghead staves, lower and top mast spars, flooring-boards and planks, wooden houses and stores. Many such advertisers are, of course, consignees, who dispose of everything which the ships bring over, without confining their attention to any one kind in particular. Some, however, deal in one class of commodity chiefly—grocery in one case, drapery in another, glass and earthenware in a third, wine and spirits in another, chandlery in another—millinery, bricks, tobacco, toys and bijouterie, paper-hangings, tea, hats, furniture, coffee, steel, pine-apples, ostrich feathers, all succeed each other in a strange jumble, very little attempt being made to classify the advertisements.

It is observable that the Dutch advertisements relate for the most part to country matters—sales of farming-stock; and so forth. This is consistent with the nature of the population; for the shopkeepers in the towns are English rather than Dutch, whereas the farmers in the country are Dutch rather than English. There is some landed property to be sold at Swellerdam, and this is advertised both in English and in Dutch; the 'valuable landed property' in the one language is the 'kostbaar vastgoed' in the other; the 'dwelling-house,' and 'het woonhuis;' the 'water-mill,' and 'de watermolen;' the 'splendid garden and vineyard,' and the 'prachtigen tuin en wyngaard;' the 'other articles too numerous to mention,' and the 'andere artikelen te veel om te melden;' and so forth. The landed estates, farms, and houses in the country, are advertised in some considerable number; while the 'extra fat sheep,' 'fat and heavy slaughter-oxen,' 'very fat sheep and goats,' 'very fat slaughter and draught oxen,' and 'extra fat wethers,' shew that livestock is reared in considerable abundance.

In Cape Town, and in the towns generally, the masters and mistresses who seem to require workmen and servants, exceed in number the workmen and servants who require masters and mistresses—a hopeful fact for emigrants, it would appear. 'Eligible cottages,' and 'comfortable board and lodging,' are to be met with at Cape Town as well as in the mother-country. There are not many pleasures, however, for pleasure-seekers. For an admission-fee of 1s., we can see the 'American Patent Sewing-machine,' which is to be exhibited for a few days preparatory to its employment in tailoring. We can attend an organ performance of sacred music.\* But there are fewer exhibitions and entertainments advertised than is customary in our colonies; and we have been recently informed, that there is much want of pleasant sociable recreation at Cape Town.

Local politics, as may be supposed, occupy a portion of the advertising columns. We learn in another part of the paper, that an election is going on; and in the advertisements one of the candidates is thrust forward as follows: 'The Conquering Hero, Vigne, has beaten every candidate at the poll into immortal smash, and he is now sure of coming in with the largest suffrage, upwards of 600 votes. Vote for Vigne. (What a Sell!!!)' How to interpret the last three words, we know not: perhaps they contain a bit of satire. There must be something like satire, too, in the following: 'It is admired by all the neighbours at Mowbray, how healthy and fat Mr Caffin and his family have got since

he came to live at the back of a butcher's shop at Mowbray. They are surprised that he should complain of nuisance, when he has got so healthy and fat with the smell of it.—N.B. A very healthy spot.' There is another advertiser, a shopkeeper, who heads his advertisement, 'Everting Hyperbole.' Whether this is a combination of Nigger with Greek, we cannot say; but the advertisement itself is a magniloquent announcement of Refrigerating Zephyrs, at 10s.—'under a good faith assurance, that the nominated garment is at least equal in style, finish, and material to any summer garb heretofore sold in this colony for 15s.'

There is one advertisement which sounds very much like the runaway-slave notifications met with in another region. It purports that, on a certain day, there absconded 'a South African Der Mozambique boy, with large eyes, has a fine mouth, and is about four feet high, answering to the name of FLIP. Had on a painted (green) canvas hat, a black summercloth jacket, and a pair of leather trousers; was last seen near Hardekraaltje, on the main road. All persons kindly requested to lodge him in the nearest jail, and to give notice to the undersigned. Any one harbouring him will be prosecuted.' We are not aware that any kind of slavery exists in Cape Colony; and therefore it is probable that little Flip with the painted hat had done something wrong, and, to escape punishment, had absented himself without leave. Mozambique, it may be observed, is a Portuguese settlement on the east coast of Africa, inhabited by Portuguese, half-castes, or creoles—Banyans from Hindoostan, free coloured persons, and slaves; but these slaves, we presume, would not be such on British territory.

The Cape wine, which we bolster up by imposing heavy duties upon better wine from other places, is an object of some importance to the colony. Many of the advertisements relate to vineyards; one of them announces the sale of a vineyard having '80,000 vines in luxurious growth.'

These matters are perhaps small in themselves, but they are not without value, in so far as they illustrate life at the Cape.

## THE MONTH:

### THE LIBRARY AND THE STUDIO.

#### THE LIBRARY.

WHATEVER we may think of other campaigns, the literary campaign this season has certainly been an unsuccessful one. We have been all absorbed in reading newspapers, and have found enough to do to understand their contradictory narratives. The suspicion that language *was*, after all, given to man for the purpose of concealing the truth, has forced itself on many a mind, and may help to account for the fact, that men of the pen are now set aside for men of the sword. Books, at anyrate, have given way to battles; and authors who were beginning to acquire quite a status in society, venturing even to make love to real ladies of the world, are now once more repulsed in the direction of Grub Street. The red coat and the epaulette carry all before them; and if we scribes intend to earn a living, we shall be obliged, for several years, to make our style bristle with bayonets, and to substitute cannon-balls for full stops. There will be great competition, however. We learn that some seventy officers in the Eastern army alone are keeping journals, with a view to publication. Let the Queen's English take care of itself.

Meanwhile, our library shelves are already filling with warlike publications. Scarcely a day passes that some fresh work does not make its appearance. Old

\* We are reminded that 'those who have visited the Tea-gardens at Little Paradise should do so again; those who have not, should do so now, whilst it is in its glory.' (We must remember that January and February occur in the South African summer.) 'Passengers, pleasure and wedding parties, will find this the only place where they can enjoy themselves in the open air, free of sun, wind, and dust, during the summer months.'

volumes are reprinted; new ones are hastily thrust through the press. Forgotten articles in magazines are dug up, and forced to do duty again in glossy covers—veterans in a modern uniform; every man who has once written on Turkish affairs, thinks it incumbent on him to write again; every man who has spent a few days in the East, or passed a week or two in the North, hastens to relate his experiences and explain his policy. Admirals and generals will be much to blame if they do not know what to do—if Cronstadt be not pulverised, and Sebastopol devastated with fire and sword.

Perhaps one of the most interesting contributions to the literature of the war, is one that was not meant as such—namely, the Baron von Haxthausen's work upon Transcaucasia, describing the nations and races between the Black Sea and the Caspian to the south of Circassia. Although the writer has a strong bias in favour of Russia, his opinions seem to be honestly given; and his statements, when justified by his own observation, bear the stamp of accuracy. Of the hatred of the Circassians to their Russian rulers, he makes no disguise. So strong is this feeling, that all matrimonial alliances between the two people are looked upon with horror, the Circassian girl preferring slavery to marriage with the Cossack. Now that the independence of Circassia is becoming a question of policy, not unlikely, perhaps, to receive a speedy solution, such information as that which the Baron von Haxthausen imparts, assumes double interest and importance in whatever light considered. With the exception of this class of works, however, there is, as we have said, little other literary activity visible. The increasing price of paper no doubt checks many speculations, though it ought to have but a moderate effect on the book-trade. However, it is certain that what is called 'the season,' has been shorn of at least two good months; and they say that there is not the slightest hope of any revival of business until the end of autumn. At the same time it is worth observing, that in practice the publishing year has ceased to be divided, properly speaking, into seasons. Setting aside the disturbing influence of the war, the book-buying public is quite as ready to purchase now as at any other period. The general diffusion of a taste for literature among classes not migratory, who remain all the year round in London, taking weekly trips only to Brighton, Hastings, Margate, or Gravesend, during the hot weather, is sufficient to account for this change.

Meanwhile, literary men are, of course, working actively whilst waiting for a demand. Mr Thackeray was last heard of under the shadow of Vesuvius, diligently plying the pen; Mr Macaulay is studying Dr Sacheverell and the bed-chamber intrigue for the new volumes of his history; Mr Hallam is adding new notes to his historical works; Rogers, the veteran poet, is engaged in a somewhat similar occupation; Lord Mahon has just completed the seventh and last volume of his *History of England from the Peace of Utrecht to the Peace of Versailles*; Mr Wilson Croker is still occupied in preparing a new edition of the works of Pope, and has just come into possession of an unpublished 'character' of the Duke of Marlborough, intended to have been introduced into the *Moral Essay on the Use of Riches*. Such are some of the items of intelligence in circulation from the Republic of Letters, where also there is talk of a new novel or novels by Victor Hugo—for which a sum of £5000 has been offered and refused.

Among the books that have been published with more or less success during the month, may be mentioned M. Lamartine's *Memoirs of Celebrated Characters*. The author intimates that this is his last work, and that he will now withdraw, as did Bellini, whilst yet his voice has power. We confidently expect, however,

some 'more last words;' and, indeed, should regret to see the parting work of so great a man so far beneath his best performances. M. de Lamartine says: 'We have formerly sung the poet's language for the idle and the happy of earth; we have since spoken the language of orators in the tribune, and of statesmen among the storms of the Republic: more humble to-day, and perhaps more useful, we blush not to learn the phraseology which reaches the intellect through the heart, to be simple with the simple, and childlike with children.'

The reader might expect from this, that the work in question would be distinguished by greater simplicity of style than characterises M. de Lamartine's previous productions. But this is far from the case: while there is less picturesqueness, less truthful eloquence, than in his former works, there is a greater profusion of unnecessary ornament, antithesis, and glittering verbosity. The portraits he presents us with are distortions; their features are overlaid with touches which may give a certain kind of dramatic effect, but which destroy all reality. We scarcely recognise even familiar historical acquaintances in the strange garb in which M. de Lamartine has arrayed them. Throughout there is a great straining after originality, and the effort is to some extent successful; but it is not a satisfactory success. We are more startled than pleased, more offended than convinced. We learn that Cromwell was 'a fanatic, led away by a miasma;' that Milton was also a 'fanatic,' and the accessory to a 'cold-blooded murder;' that Socrates was 'inspired with the disinterested and divine passion of improving others,' exhibiting, however, 'little sympathy with human nature.'

M. de Lamartine professes to be aware of the responsibility attaching to the task he has undertaken, but it is a responsibility which never appears to weigh very heavily upon him. He disregards established authorities, and adopts those which are more than apocryphal; he passes judgment off-hand, though we see well he has not sufficiently weighed the evidence, or considered his opinion. No wonder, then, that we should dispute his sentence, and question his decrees. Midway between fact and fiction, these memoirs may take their stand awhile in contemporary literature, but in the realm of sober historical biography, we predict that they will find no permanent place.

In the *Memoirs of the Life of Amelia Opie*, selected and arranged from her letters, diaries, and other manuscripts, by Cecilia Lucy Brightwell, we are presented with an unpretending, but exceedingly interesting account of the life of a good-hearted clever woman, whose reminiscences take us back into another generation, amid persons and events that have become historical. Amelia Alderson—such was Mrs Opie's maiden name—was the daughter of a physician, and was born at Norwich in 1769. While yet a mere girl, only fifteen years of age, her mother died, and the future authoress became the head of her father's household—a position which tended to develop the peculiar and rather precious tastes and talents she possessed. Her first literary productions were simple ballad-songs, which she learned to sing with a pathos that melted the hearts of all hearers. Afterwards conceiving a passion for the drama, she wrote a tragedy, the merits of which were tested with success by a private performance, in which she herself took part. It was doubtless owing to this predilection for the drama that she became acquainted with the Kemble family, with whom she formed a close friendship. A few years after the production of her tragedy, she visited London, was introduced into various literary circles, and formed an intimacy with Opie the painter, whom she married in 1798. For some time she found it convenient to follow literature as a profession; writing several successful novels, and some sketches of Paris, which city, shortly after her union, she visited with her husband. Upon his death, in 1807, Mrs Opie left the gay world in which she had

for some time been living, and sought the seclusion of her native city. There she employed herself in preparing her husband's lectures for the press, and in other literary occupations, occasionally disturbing the calm of this existence by visits to London, and to her literary friends. In 1824, influenced, doubtless, by Elizabeth Fry, with whom she was acquainted, Mrs Opie formed the resolution, strange for a woman so full of vivacity and cleverness, and so fond of animated life—of joining the Society of Friends; and in 1825, she was formally admitted into that religious denomination. Although, until the end of her days, she remained a member of the sect, and frequently seemed restrained by her self-imposed fetters, she paid two visits to Paris, and occasionally re-appeared amidst the gay society from which she had banished herself. Although censured by some of the more strict among the body to which she belonged, her acknowledged goodness of heart shielded her almost completely from animadversion. Dying serenely, at a great age, only a few months ago, she left a name fondly endeared to a numerous circle of friends by the many acts of kindness with which it was associated. The book is highly interesting, as presenting us with the portrait of an amiable and talented woman, whose life and character shew us many remarkable contrasts. Almost equally interesting, too, are the anecdotes of the notabilities with whom Mrs Opie was acquainted, and which include the names of Sir Walter Scott, Madame de Staël, Byron, Sheridan, Godwin, Mary Wollstonecraft, Northcote the painter, and many others.

There are two other books recently published, likely to be interesting to the respective classes to which they are addressed. The first is M. Van de Veld's *Travels in Palestine*, in which the author, not very successfully, attacks M. de Saulcy's alleged discoveries near the shores of the Dead Sea; and the second, Sir Henry Bunbury's *Narratives of some Passages in the Great War with France*, containing much valuable information, and several piquant sketches of celebrated characters—as Sir Sydney Smith, Sir Ralph Abercromby, &c. The tendency of the writer is rather to depreciate our favourite heroes, and he contrives to represent the defender of St Jean d'Acre in somewhat a ridiculous light. It is to be hoped that he is not actuated by any feelings of jealousy or disappointment.

#### THE STUDIO.

The opening of the Crystal Palace is an event in the history of art, the importance of which it would be difficult to overestimate. There, in one fairy building, recalling the glittering palaces of our dreams, are accumulated the richest treasures of the past—the most graceful forms of beauty that the genius of man has called into being—the art-records of every age and of every country, for the world to read and ponder on. It is not too much to predict, that an Art Museum of such resources will ere long be the means of purifying and elevating the public taste, and of creating a love for the beautiful amongst those to whom such an emotion had been previously unknown. The Crystal Palace may be looked upon as a great school in which many will learn much; all, something. Such a spectacle of beauty will refine, to a certain extent, even the coarsest mind. It will awaken new thoughts, new emotions. It will yield a pure and satisfying pleasure, such as, perhaps, hundreds who throng its courts would have deemed themselves incapable of experiencing. It may not make us all artists; but it will make us lovers of art. It will become the great studio, where, amid the master-pieces of Phidias, of Praxiteles, of Buonarroti, and of the gifted of all time, the sculptor may for ever learn new lessons in his art, and the mere spectator find unceasing pleasure. A sight of the well-displayed statues of the Crystal Palace has,

our recollection the miserable accommodation afforded to the same branch of art at the Royal Academy. How much longer will that august body be pleased to shew the works of our sculptors in such a dismal, dreary cellar, when a few pounds, judiciously spent, might at least allow a little daylight to enter the cheerless cavern? Since the opening of the Crystal Palace, this subject has been much discussed. It is to be hoped that something will be done in the matter ere long.

At length the 'finest site in Europe' has received the concluding addition to its attractions. The last of the bass-reliefs of the Nelson Column has been added to that structure, the subject being Nelson receiving the sword of the commander of the *San Josef*. The figures are bold and masterly, and the whole effect is striking. The number of years which have been consumed in the erection of this Column, induced at one time a belief that only to another generation would be accorded the pleasure of seeing it completed. As an additional proof of the active vitality of the government, I may mention that preparations are being made for restoring the public monuments in Westminster Abbey at the nation's expense. A grant of L.5000 has been made for the purpose; and operations, under the superintendence of Mr Scott, the architect of the Abbey, are to be immediately commenced. In the present state of public affairs, with a war which is the huge apologist for all kinds of neglect, it is gratifying to find government mindful of a duty so likely at such a time to escape their attention.

Some little alarm has of late pervaded artistic circles, owing to the arrival in London of Dr Waagen, at the invitation of Prince Albert, for the purpose, as was rumoured, of taking first command at the National Gallery. Dr Waagen is the director of the Royal Gallery of Pictures at Berlin, and is the author of a work upon the *Treasures of Art in Great Britain*, which, despite several errors that are discoverable in its pages, is a valuable and interesting addition to the branch of literature to which it belongs. Although Dr Waagen is acknowledged to be a man of great ability, it was scarcely credited by the more reflective, that he had been invited here by the Prince to take an office which he could not have held without giving umbrage to the national feeling; and this view of the case has proved to be correct. Dr Waagen, we are told on authority, is here simply for the purpose of classifying and cataloguing the collection of early German art, the property of Prince Louis d'Ottingen Wallerstein, at Kensington Palace.

It may be mentioned as almost a new feature in this age, distinguishing it from the past, that few men of note are allowed to pass away without some visible monument being soon raised to their memory. James Montgomery, our latest loss, is to have a bronze statue erected to him at Sheffield, his native place. A committee is now conducting the preliminary proceedings. A statue of another Sheffield poet, Ebenezer Elliot, is also just completed. The work has been executed by Mr Burnard, a young sculptor of great promise, and possesses considerable merit. It is to be sent to its destination immediately. A somewhat novel monument to James Watt—to whom the world is so largely indebted—has been projected by Mr John Gray, a very energetic member of the Watt Club at Greenock. Mr Gray proposes to erect on a high rock, near Watt's birthplace, a monument composed of a number of stones, each stone to bear the name of its contributor. A similar tribute to Washington already exists in America. From the favour with which the project has been received—promises of support having already arrived even from Canada—it seems very likely that the plan will be adopted. Perhaps the proposal to give such marked prominence to the names of the donors

advertisement; and, at anyrate, looks like a bait to catch contributors. Many people are ready to commemorate themselves whilst pretending to commemorate others.

Marlborough House has added another very interesting feature to the already large collection it possesses—consisting of various specimens of arms, swords, pistols, daggers, breastplates, Damascus and Toledo blades, arabesque shields, brassards, battle-axes, and other implements of warfare, ancient and modern—the whole having been lent by Her Majesty and Prince Albert. This exhibition, extremely interesting even to the casual visitor, is of the greatest value to the student; or rather will be so when a suitable catalogue and description have been published.

A Report, that has been published by the Department of Science and Art, gives a very satisfactory account of the success of the Schools of Design lately established on the self-supporting system throughout the country. In little more than a year, twenty of these schools have been founded; whereas sixteen years had been found necessary to establish a similar number previously. The practical working of these schools is shewn in the fact, that manufacturers are already availing themselves of the talents of the students, many of whom are young women, to whom a lucrative and elegant means of existence is thus afforded. We do not perhaps properly appreciate the value of this art-movement which is going on, because it is so near to us; but the next generation will have to thank us for introducing a refined taste, and opening up intellectual sources of enjoyment which have always been so much wanted in this country.

#### HALLUCINATIONS OF GREAT MEN.

Spinello, who had painted the Fall of the Angels, thought that he was haunted by the frightful devils which he had depicted. He was rendered so miserable by this hallucination, that he destroyed himself. One of our own artists, who was much engaged in painting caricatures, became haunted by the distorted faces he drew; and the deep melancholy and terror which accompanied these apparitions, caused him to commit suicide. Müller, who executed the copper-plate of the Sixtine Madonna, had more lovely visions. Towards the close of his life, the Virgin appeared to him, and thanking him for the affection he had shewn towards her, invited him to follow her to heaven. To achieve this, the artist starved himself to death. Beethoven, who became completely deaf in the decline of life, often heard his sublime compositions performed distinctly. It is related of Ben Jonson, that he spent the whole of one night in regarding his great toe, around which he saw Tatars, Turks, Romans, and Catholics climbing up, and struggling and fighting. Goethe, when out riding one day, was surprised to see an exact image of himself on horseback, dressed in a light-coloured coat, riding towards him.—*Rudcliffe's Fiends, Ghosts, and Sprites.*

#### BRANDY ON THE MOUNTAINS.

It is astonishing the effect produced by spirits upon persons of even the strongest constitution, when indulged in at an elevation of 10,000 or 12,000 feet. I have had opportunities of observing this; and Captain S— informed me, that at 19,000 feet it is perfectly dangerous to take any quantity of raw spirit, as even half a wine-glass of brandy produces intoxication. I would recommend all hill-travellers to drink nothing but hot tea; for travelling up mountains and down valleys, across bridges of very questionable security, requires a firm and steady nerve, which it is impossible for those who indulge freely in the use of spirits to retain long in the snowy regions.—*James's Volunteer's Scramble.*

#### 'LAUNCH OF THE ROYAL ALBERT.'

A correspondent informs us that a mistake has crept into the above article: that the actual length of the *Royal Albert* is 372 feet, and that of the *Duke of Wellington* 278 feet.

#### THE SEA-SHORE.

MOURN ON, mourn on, O solitary sea!

I love to hear thy moan,  
The world's lament attuned to melody,  
In thy undying tone;  
Lo! on the yielding sand I lie alone,  
And the white cliffs around me draw their screen,  
And part me from the world. Let me disown  
For one short hour its pleasure and its spleen,  
And wrapt in dreamy thought, some peaceful moments glean.

No voice of any living thing is near,  
Save the wild sea-birds' wail,  
That seems the cry of sorrow deep and drear,  
That nothing can avail;  
Now in the air with broad white wing they sail,  
And now, descending, dot the tawny sand,  
Now rest upon the waves, yet still their wail  
Of bitter sorrow floats toward the land,  
Like grief which change of scene is powerless to command.

The sea approaches, with its weary heart  
Moaning unquietly;  
An earnest grief, too tranquil to depart,  
Speaks in that troubled sigh;  
Yet its glad waves seem dancing merrily,  
For hope from them conceals the warning tone;  
Gaily they rush toward the shore—to die,  
All their bright spray upon the bare sand thrown.  
While still around them walls that sad and ceaseless moan.

And thus it is in life, and in the breast  
Gay sparkling hopes arise,  
Each one in turn just shews its gleaming crest—  
Then falls away, and dies;  
On life's bare sands each cherished vision lies,  
Numbered with those that will return no more;  
There early love—youth's dearly cherished ties—  
Bright dreams of fame, lie perished on the shore,  
While the worn heart laments what grief can never restore.

Yet still the broken waves retiring strive  
Again their crests to rear,  
Seeking in sparkling beauty to revive  
As in their first career;  
They strive in vain—their lustre, bright and clear,  
Forsakes them now with earth all dim and stained;  
And thus the heart would raise its visions dear,  
And shape them new from fragments that remained,  
But finds their brightness gone, by earth's cold touch profaned.

Long have I lingered here, the evening fair  
In robe of mist draws nigh,  
The sinking sea sighs forth its sad despair  
More and more distantly;  
Hushed is the sea-bird's melancholy cry,  
For night approaches with the step of age,  
When youth's sharp griefs are softened to a sigh,  
And the dim eye afar beholds the page  
That holds the records sad of sorrow's former rage.

And nature answers my complaining woe  
With her own quiet lore,  
Bids me observe the mist ascending slow  
From the deserted shore,  
And learn that scattered and defiled no more  
The fallen waves are wafted to the skies,  
That thus the hopes I bitterly deplore,  
Though fast they fall before my aching eyes,  
Fall but in tears on earth to Heaven unstained to rise.

IN THREE CHAPTERS.

### CHAPTER I.

THE annals of the British aristocracy have already furnished the historiographer with numerous chapters of family romance; but those archives of an order, wherein a place is esteemed by the many as the highest guerdon that beauty, bravery, genius, can win, must necessarily be inexhaustible in such revelations. Here is one that not long ago fell within my own experience; and, by simply restoring the original names and localities—altered by me for reasons that will be obvious—it would in all essential particulars faithfully reproduce an episode in the domestic history of one of our great county families; not, it strikes me, interesting only from the collision and evolvment of curious and striking incidents, but pointing an instructive moral, which they who run may read—although the catastrophe may not be thought to reach quite to the ideal standard understood by *poetical* justice—an objection to which the romance of real life will, I fear, be always more or less obnoxious.

The bankruptcy, in 1842, of Mr Ansted, a city merchant, in whose amiable family, domiciled in one of the squares of Tyburnia, I had officiated as governess since I left Lancashire—a lapse of nearly seven years—threw me once more upon the world in search of dependent bread. As I was an orphan, and had no relative that I knew of capable of assisting me to reach a more eligible path of life, there was, of course, nothing before me but to obtain as quickly as possible a like situation to the one of which Mr Ansted's commercial calamity had deprived me of: even that would not, I feared, and with reason, judging from the crowded state of the governess' columns in the *Times*, be of very easy accomplishment. Happily a caprice, that of advertising in my own name, Miss Redburn, instead of the stereotyped 'A Lady,' dissipated my apprehensions, and in a very unexpected and startling manner. About three o'clock in the afternoon of the day my advertisement appeared, a fashionable barouche and pair dashed up to the door of the house in Upper Seymour Street, where I had taken temporary lodgings, and a lady alighted, elegantly attired in a slightly mourning carriage-dress, whose important presence was instantly announced by a footman on the knocker, with a vehemence that brought half the first and second floor habitants of the quiet street to their windows. 'Is Miss Redburn at home?' was asked by a female voice, the rich tones whereof struck my ear familiarly. The scared serving-girl replied, I suppose, in dumb show, by pointing to the door of my room; for with hardly a pause between,

the same voice said: 'Thank you; that will do: I will introduce myself:' and the next moment the carriage-lady was before me—in my arms! The flashing light of her dark brilliant eyes greeted me as joyfully as did her sisterly embrace and glad exclamation: 'Dear, dear Gertrude, I am so delighted to have found you! Surely,' she added with a gay laugh, and partially yielding to a sort of instinctive effort I made to free myself from her clasping arms—'surely you cannot have forgotten your old friend and pupil, Clara?'

'Clara Selwyn!' I exclaimed, forcibly releasing myself, as a dreadful thought arose involuntarily in my mind—'Clara Selwyn!'

The lady's flushed cheek and haughtily curling lip shewed that my ungenerous suspicion was read aright. 'Yes,' she coldly replied, 'Clara Selwyn, when you knew me, Gertrude, but Mrs Francis Herbert not very long after you left Lancashire, and now for several years a widow.'

'Francis Herbert, of Ashe Priory!'

'Just so. Should that so much astonish you?' she added, glancing proudly at the mantle-piece mirror. 'You perhaps imagine that the magnificent Mrs Herbert, the dowager, would have sufficient influence over her son to dissuade him from such a *mesalliance*. It did not prove so,' continued my charming visitor with a sweet silvery laugh, and resuming her previous caressing tone and manner: 'those are obstacles, dear Gertrude, which light-winged, youthful love easily overleaps; and we were privately married within, I think, six months of our first meeting.'

'Privately married!'

'Certainly. My husband's stately mother's many excellent qualities, both of head and heart, were strictly subordinate to her all-mastering pride of birth, and to have asked her consent would have been an absurdity. Nay, the after-chance discovery of what had taken place almost proved fatal to her life, suffering as she did from disease of the heart. Happily, that peril passed away, and we were *quite pour la peur*. Still forgiveness was not to be hoped for, and we left England to vegetate in obscurity abroad, till time and the stars should permit us to return and assume our proper position. Exile, poverty, in a comparative sense,' added Mrs Herbert—a dark cloud for a moment veiling her lustrous loveliness—'would have touched me little, but for the loss of my husband barely three years subsequent to our marriage. Since then, I continued to reside in the south of France, with our only child, little Francis, and mamma, till about two months ago, when the sudden death of Edmund Herbert summoned us home to fortune—greatness.'

'What a bewildering turn of the wheel! I read a

notice of Mr Edmund Herbert's death in the newspapers. He died of *tetanus*, or locked-jaw, did he not, resulting from a gunshot wound in the hand ?

'Yes; and his mother, to whom he was devotedly attached, did not survive the shock more than a few hours. He was, you are aware, my husband's elder brother, and several years his senior, but had never married. I knew him by reputation only—not, it so chanced, personally—and that he was one of the highest-minded, most generous of men. But enough of this for the present. We shall have plenty of time hereafter for indulgence in gay or gloomy reminiscences. My present business here, Gertrude, is to offer you a home at Ashe Priory, as preceptress to my son—as companion and friend to myself. You will not refuse, I see,' she added, affectionately kissing me. 'We shall be sisters, as we were in the old time. So extremely fortunate—was it not?—that I to-day glanced over the advertisement part of the newspaper—so rare a thing for me to do.'

I expressed my grateful thanks as clearly as the strong emotion which agitated me permitted, and presently said: 'Your sister Mary, dear Mrs Herbert, she who so well deserves happiness, has not, I fear, drawn a prize in the strange lottery of life ?'

Beautiful Clara, variable and sensitive as a child, was instantly sad again. 'Alas! no; and she, too, is a widow. But Mary and her little boys must, and shall,' she added, 'spite of mamma's unreasonable objections, take up their abode with us; and therein, Gertrude, I shall also need your aid and sympathy. But of this hereafter. That which we have now to understand thoroughly is, that you breakfast with us to-morrow morning at the Clarendon, Old Bond Street, where we have been staying for the last ten days, and whence we set off, at twelve precisely, for Ashe Priory.'

It was so settled; and Mrs Herbert left me, half doubtful that I had heard aright; and it was far into the night before my brain had ceased to throb and sparkle with the thick-coming images—the rekindled memories of some twenty years—which her unlooked-for presence and strange news had awakened into life. A brief resumé of those thronging reminiscences must necessarily precede the telling of the story sequential to them, in which I was now about, unwittingly, to become an actor as well as auditor.

The Selwyns and ourselves were next-door neighbours, though living half a mile asunder, in a rural parish of Lancashire, the metropolitan village whereof—about a quarter of an hour's smart walk from our sequestered dwellings—was as dull, decorous, old-world a place as could, I imagine, be found in the most agricultural county in Great Britain. Both families had been thus domiciled as far back as my own personal experience extended, but I knew that in his early manhood, Mr Selwyn had attempted to practise as a solicitor in our little market-town, with such lamentable fortune, that he contrived not only to lose the only suit of importance he had ever been intrusted with, but to blunder so outrageously in the conduct of it, as to render himself liable in heavy damages to his own client. These first-fruits of his legal exertions so disgusted Mr Selwyn with the profession, that he resolved to espouse forthwith Mary Everett, the daughter of a deceased clergyman, and withdraw from ungenial business avocations to the sylvan quietude of Beach Villa,

grounds, of about an acre in extent, with the hope of there gliding through life unvexed by the cares, vanities, and ambitions of the rude, bustling, outer world. As he was possessed of a clear eight hundred a year, and married a gentle, well-principled, true-hearted woman, this expectation, though not destined to be realised, cannot, I think, be said to have been unreasonably based. His wife, unfortunately, died in giving birth to their first child, a girl; and deeply as Mr Selwyn was thought to feel her loss, his plastic nature so readily again yielded to feminine influence, that the orthodox year of mourning had barely expired, when he appeared for the second time at the marriage-altar—his bride on this occasion being Clara Stapleton, an intimate acquaintance of his first wife, though an altogether different person. Clara Stapleton must have been endowed with rare personal charms, for she was still singularly handsome sixteen years later, when I had attained an age capable of appreciating such attractions; but the spirit within matched ill with the unflawed beauty of its mortal covering. Not that Mrs Selwyn was a bad person in a direct and positive sense: she would not have uttered an absolute falsehood—have committed a manifestly evil deed; but vanity and pretence—the prolific sources of not less real, if unspoken, deceit, meanness, and injustice—were her besetting sins. Though greatly bettered in circumstances by marriage, she quickly wearied of the dull monotony of Beach Villa; and as her empire over good, easy Mr Selwyn was absolute, an absurdly pretentious style of living was attempted, which treble her husband's income would hardly have justified. The result was not only pecuniary embarrassment, but frequent social mortification and discomfiture at the hands of the local aristocracy, sought to be propitiated by a tinsel imitation of their own, after all, not very splendid glories. Two considerable legacies were squandered in bolstering up and prolonging Mrs Selwyn's ambitious aims; but the end was visibly at hand by the time Clara, Mr Selwyn's only child by his second wife, was in her eighteenth year.

Mr Selwyn had been for some time rapidly breaking—borne down, not by years, he was little more than five-and-forty, but by mind troubles—when the crash came, and put the finishing stroke to his broken fortunes and failing life. An execution which he could not pay out, was sent into Beach Villa, and, driven to extremity, he did that which, a few years previously, might have saved him—placed his affairs in the hands of his old friend, Mr Thornley, a thorough man of business, and now, I have heard, one of the largest holders of railway stock in the kingdom. That gentleman readily undertook the ungracious charge; and a thorough investigation ensued, by which it was ascertained that when all just claims were satisfied, not more than one hundred a year, at the utmost, would remain to the Selwyns, exclusive of Beach Villa—upon which there was a heavy mortgage—and its gewgaw furniture. This disclosure frightened Mrs Selwyn into submission, and she peevishly acquiesced in the discharge of the servants, with the exception of a maid-of-all-work, and the sale of the phaeton, horses, Clara's Arab pony, &c. Poor Mr Selwyn did not long survive this calamitous downcome. I was at home at the time, having not long previously returned from Liverpool, where I had been studying, to qualify myself for the precarious profession which, it had been for some time foreseen, would, ere many years—perhaps months—be my only earthly resource; and being a good deal with Mr Selwyn, I soon came to know that the carking anxiety which chiefly weighed upon his mind, was not for his wife, whose criminal follies, weakly acquiesced in by himself—that was the sharpest pang—had greatly lessened, not to say destroyed, the love he once bore her; nor for his eldest daughter, Mary, was his mind haunted by sinister forebodings—she would be

felt, walk erect and unswervingly along the slipperiest and most perilous life-path she might be required to tread; but Clara, what with that dangerous gift of unmatched loveliness—that impulsive, ambitious disposition, derived from her mother, though, it might be hoped, attamped to loftier issues—what, in the dark future, might become of her, left unbuckled from the sordid world by his, her father's, dastard lack of firmness! That was the sting of death; and eagerly did his fainting spirit toil to devise means of atoning, if but partially, for his grievous fault. A will was drawn up and executed, by which Mary Selwyn, who had just passed her majority, was constituted sole trustee of all he might die possessed of, and absolute guardian of her sister Clara. To the last, this thought dominated all others. I was present when the final summons came, and well do I remember that closing scene. His wife had been almost forcibly removed, at the dying man's request; her wild, remorseful outcries rendering it impossible that he, feebly struggling in the close grasp of the Destroyer, should fulfil the purpose nearest his heart—the earnest commending of Clara to her sister's watchful care and tenderness; and of impressing upon Clara that to her sister—not mother—she must look for counsel and guidance, and in all essential things yield her true and loving obedience. The pledges so solemnly demanded were as solemnly given by the weeping daughters; and a gleam of placid joy lit up for a moment the darkening eyes of the dying father, whose quivering lips, whilst his wasted hands rested upon the bowed heads of his children, seemed to be invoking a blessing on them. Presently, the feeble hands slipped aside, the slightly raised head fell gently back upon the pillow, and the faint light and smile passed away with a sigh, and the murmured ejaculation, 'Thy will be done!'

Death passing through a household but transiently darkens and interrupts its daily life. The old cares, duties, vanities, quickly resume, and till another arrow strikes, maintain their accustomed sway. Mrs Selwyn's passionate self-reproaches soon changed to fretful lamentations over the cruel and quite unmerited reverse of fortune that had befallen herself and Clara—Mary, her step-daughter, never having been included within the circle of her selfish sympathies. Clara's radiant bloom stole gradually back to her cheeks—ay, and Mary's genial cheerfulness before long again cast its sunny glow on all around. A very admirable person was Mary Selwyn, of a rare sweetness of temper, and gentleness of disposition, combined with unbending firmness and rectitude of character—qualities which required not the attraction of physical beauty to win for her the love and esteem of all worthy hearts that came within the range of their unobtrusive influence. Not that Mary Selwyn was wanting in feminine comeliness and grace—very far, indeed, from that; but her beauty was of a more subdued, less striking type than that of her sister, and especially to unfamiliar eyes, seemed eclipsed in Clara's presence. Mary was now the sole stay and hope of the bereaved and impoverished family. Mrs Selwyn ungrudgingly resigned to her the desperate task of keeping house upon a hundred pounds a year; a judicious economy took the place of careless extravagance, and the future gradually assumed a more hopeful aspect. It was settled, that as soon as Beach Villa could be advantageously let, they would seek a less expensive home, at a distance from the scene of their former comparative splendour; and, in the meantime, Mary, with my assistance, set vigorously to work to perfect Clara's educational accomplishments, which a blind indulgence had permitted to fall in some respects sadly behind-hand. She was, however, apt and willing, and, no longer interfered with by Mrs Selwyn, who seldom, indeed, stirred out of her bedroom, made rapid progress.

Some five or six months had passed thus pleasantly and profitably away, when Mrs Selwyn's ambitious longings, partially rebuked, but ineradicable, unfortunately revived again in the dazzling light of her daughter's beauty, which, she had finally persuaded herself, could not, if judiciously brought into play, fail to secure Clara, and of course Clara's mother, a far higher position in the world than that mother's cruel folly had despoiled her of. It was quite true that the younger Miss Selwyn's rare personal gifts had begun to excite a sort of agitation in our corner of the county, and that her name was in the mouth of every feather-headed fopling for miles around, suggesting sinister or fortunate auguries, as the envious or benevolently hopeful dispositions of the prophesiers determined. One consequence of all this was numerous impertinent calls at Beach Villa, under pretext of inquiring the terms upon which it could be let, and of viewing the premises, by parties who had not the remotest intention of becoming tenants. As soon, however, as it came to be well understood that such visitors would see nobody but Mary Selwyn, or myself, if I happened to be there, the annoyance abated, to be renewed, in some instances under a more decorous and less transparent mask. One gentleman, of about my own age I judged, which was a few months more than that of Mary Selwyn, and, to our unskilled appreciation, of remarkably aristocratic appearance and manners, would not be denied an intimacy to which he had no legitimate nor conventional claim. Finding that Miss Selwyn's icy reserve could not be otherwise broken through, Mr Calvert, as he called himself, produced, with evident reluctance, blushing the while like a school-girl, and presented to Mary a letter written by her father—there could be no doubt about that—expressing the warmest thanks for some service or favour which the writer had received at the hands of the person addressed. Miss Selwyn read it with emotion, but presently remarked in a partly apologetic tone: 'There is no address, sir, at the foot of this note. You have the envelope, of course?'

The gentleman, instead of firing up, as I should have thought he would at the implied suspicion, changed colour, and with something of agitation in his voice and manner, said: 'No, I have not; it has been mislaid or lost. But surely Miss Selwyn cannot think so meanly of me as to believe that I would assume, falsely and basely assume, to have rendered the trifling service alluded to; that I—I—'

He stopped for want of words or matter, and Mary, who had intently observed him, said: 'I do not believe so, Mr Calvert. Will you walk in?'

From this time, Mr Calvert became a very frequent visitor indeed; but invariably, as I afterwards frequently recalled to mind with a pang of regret at my own want of penetration, at such hours that he would be sure of meeting with none but the family. I very much liked this Mr Calvert withal; his conversation was refined and intellectual; and, witless dogmatist that I must have been, if what I heard of him about a year after my removal to London was correct, I—piquing myself, too, upon accurate perception of character, and especially male character—pronounced him to be a person of large conscientiousness and self-sacrificing amiability! Constancy, indeed, if we had rightly divined his mission at Beach Villa, was not of the number of his virtues, for it was before long very apparent to me that Mary Selwyn, not her all-conquering sister, was the compelling lode-stone that drew him there; and it was becoming pretty clear, moreover, that his preference would at no great distance of time be reciprocated, when an unexpected incident shewed me, or seemed to do so, how little I comprehended Mr Calvert, or the impulses by which he was governed. Clara and her mother had accepted an invitation to pass a week with the Lumadens, retired and tolerably wealthy trades-

people, who had removed not long before the Selwyns' downfall from our neighbourhood to a place about ten miles off; and a letter from Clara, ostensibly to announce a prolongation of the visit, startled her sister and myself, not only by informing us that Captain Toulmin, son of the Hon. Mrs Toulmin, a widow lady related to the Herberts of Ashe Priory, was a daily guest at the Lumdens; but by the girlish exultation of tone in which she wrote, evidently inspired by the belief that she had made a serious and important conquest.

Mary Selwyn was both vexed and angry. 'This meeting between Clara and Captain Toulmin,' she said, 'has, I have no doubt, been concerted between him and the Lumdens—worthily, well-meaning people enough, but incapable of saying "No" to the son of an Honourable. I will write to-night, and insist upon her immediate return home.'

I agreed that it would be proper to do so, and was leaving the room, when Mary said with a kind of anxious bashfulness, a bright blush the while mantling her sweet face with scarlet: 'Mr Calvert, Gertrude, will probably look in for a few minutes this evening. He, I have no doubt, knows this reputedly gay and fashionable captain; and if you, when I am not present, were in an off-hand, indifferent manner to sound him relative to the said gentleman's character, I should, or I err greatly, be furnished with reasons for insisting upon Clara's instant return, which even Mrs Selwyn could not gainsay.'

I undertook to do so; and very blunderingly did I redeem my promise. Mr Calvert, with his quick, eager, confounding interrogatories, drew from me, before I well knew what I was saying, the exact motives of my awkward questioning; and the effect which that knowledge produced upon him was extraordinary. The flush and animation of his countenance, which, in my wisdom, I had attributed to his expectation of presently seeing Miss Selwyn enter the room, became, as I spoke, pallid and stern—with jealous anger, I concluded, what else could it be?—and his tone was high and wrathful as he replied: 'Inform Miss Selwyn that I *do* know Captain Toulmin, and so well, that I advise, that I entreat, beseech her, not to lose an hour in removing her sister from the contamination of his society. She must be firm, too, as well as peremptory, for Toulmin is not a man to be easily turned aside from any purpose, however infamous, he may have formed. He will follow Clara Selwyn here, of that be assured; and ought but evil can ensue if he be permitted, under any pretence, to thrust his presence upon this family.'

Surprise at this fiercely uttered outburst held me dumb, and three or four minutes' silence, meditative on Mr Calvert's part, followed; then starting suddenly from his chair and seizing his hat, he said: 'Make my excuses to Miss Selwyn, if you please, for thus hurrying away; but it just occurs to me that an important business-matter, which had slipped my memory, must be attended to at once: good-evening, Miss Redburn.'

He was gone; and before he could have reached the else unused stable, where his horse was usually haltered during his visits, Mary came in, to whom I of course related what had just passed. She was greatly surprised—shocked is the more accurate word—and it was plain that a pang of wounded pride mingled with the painful solicitude excited by Mr Calvert's words and manner as reported by me; for Mary Selwyn, good and amiable as she might be, was still a woman withal. She had turned from me, and was looking out of the window: 'He must, indeed, be greatly agitated,' she said, with a tremor in her tone almost successfully repressed. 'Look, Gertrude.' I did look, and saw the usually sedate, mild Mr Calvert galloping fiercely off, as if life depended upon his speed. 'He does love her, then,' murmured poor Mary, as horse and horseman

disappeared at an angle of the road. 'Well, he could hardly help doing so.' A minute or two afterwards she kissed and left me, her fine eyes bright with excitement and wet with tears.

#### A HANDFUL OF HALF-PENCE.

THE spectacle of the formidable bowls of new copper-money which, having lately been issued from the Mint, has found its way into the shop-windows of the London grocers and provision-dealers, to whom, being a glittering novelty, it serves the purpose of an advertisement, recalls to our remembrance some curious particulars respecting copper coinage, which it may be neither uninteresting nor unprofitable briefly to recapitulate. The copper coinage of this country, as European travellers have not failed to notice, is by far the best, the most substantial in manufacture, and approaches the nearest, in sterling worth, to the money-value it represents, of any that is found in circulation upon the whole surface of the globe. It is, doubtless, from this reason principally that it is subject to a continual and abnormal drain, which renders a new coinage necessary, and even indispensable, at frequent periods, and often, in large manufacturing districts, occasions a dearth of small-change, in spite of the periodical overflows from the Mint. One cause of this drain is the shipment of copper-money to the colonies, which, not being done in sufficient quantities by the government, is often undertaken by private individuals as a matter of traffic. We were intimate, some years ago, with an exporter of this singular sort of merchandise, who, without saying much about it, from prudential motives, had, in the course of a few years, realised a small competence by transmitting to a friendly agent in a South African colony repeated cargoes, packed in barrels, of the old penny-pieces of the coinage of the year 1799, which being, as all the world knows, about a fifth heavier than some of the more recent coinages, passed among the Dutchmen, who chiefly inhabited the colony, for five farthings each, and consequently yielded the exporter a profit of 25 per cent., besides the premium which the colonists could afford, and were willing to pay, for the convenience of small-change. The value of this convenience, of which we have at home but an imperfect notion, may be estimated from another circumstance, for the truth of which we can personally vouch. Some thirty years ago, or thereabouts, a gentleman, whose mercantile speculations had failed in London, emigrated with his family to Canada, intending to purchase land and settle upon it with his children. While casting about for an eligible settlement, he was struck with the annoyance and inconvenience everywhere resulting from the dearth, almost the total absence, of copper coin. The complaints that met him were loud on all sides; continual loss being suffered from the necessity of expending fivepence, the value of, the smallest silver coin, for the most trifling article that had to be purchased. After considering the subject, and taking counsel on the matter from a few of the settlers at Toronto, he resolved to supply the desideratum himself. Returning to Birmingham, he caused the requisite dies and machinery to be constructed; and on again arriving in Canada, commenced the issue of peace and half-pence, bearing the head of King George on one side, and—if we recollect right—his own promise to pay on the other. The metal of the money cost him less than half its current value; but, notwithstanding that, so great a premium did it bear, that his profits were more than cent. per cent. In a very short time, he recovered the fortune which he had lost by speculation in England. His issues, swallowed up by the necessities of commerce, never returned to him, and he settled in the country upon a handsome estate, purchased with the gains of his improvised mint.

It is most likely that the above successful experiment was suggested to the mind of the speculator by the practice which prevailed at home during the last war, and which was countenanced by the government. At that time, it would appear that every tradesman who chose to do so, coined copper-money on his own account, inasmuch as we have seen a collection of these provincial tokens, amounting to above a thousand in number, all of which were issued in the course of a very few years. Some have nothing but inscriptions on both sides; some are ornamented with views of the issuer's business establishment; and some bear the head of the sovereign, with the name of the issuer on the reverse. Many have whimsical devices, in ridicule of the French; and others are really elegant medals, admirably designed, with classical and allegorical figures, supposed to have some mystical allusion to the events of the period. There were, doubtless, regulations and restrictions by which those who issued them were rendered amenable to law; but whatever these were, we have a suspicion they were not in all cases rigidly adhered to; looking to the fact, that no sort of uniformity in the size or weight of the coins is observable, everybody seeming to give as much copper to his coin, and no more, as accorded with the dictates of his own conscience—one man's half-penny being almost as large as another man's penny. At the time when these tokens constituted a large proportion of the circulating copper coin of the realm, gold was alarmingly scarce, guineas being bought up by collectors at a price varying from twenty-five to twenty-nine shillings apiece, and their place in the circulation being supplied by one-pound notes. The bullion went off to the continent, to defray the charges of the war; and it may be that the government of the day were glad to connive at the issue of any species of coin which might, even in the smallest degree, make the loss less perceptible. The provincial tokens were all suppressed by proclamation in the early part of the present century, long before the war terminated; and as stringent penalties enforced their suppression, they disappeared almost simultaneously from circulation, and are now to be rarely met with, save in the cabinets of the curious, or the stores of dealers in coins.

As late as the years 1815-16, there was in circulation throughout the country a large amount of the copper coinages of the first and second Georges. It was lighter in weight by nearly a fourth part than some of that now in use, and so far as we can recollect, consisted entirely of half-pence; at least, we have no remembrance of a single penny-piece. Being very much worn and defaced, for want of the protecting rim, government, as early as 1800, or thereabouts, proclaimed it an illegal tender in the provinces; and thus it gradually all came up to London, where it continued to pass until after the termination of the war. We have a distinct recollection of travelling to London in the year when the Russian campaign commenced, and of the clamorous solicitations of the market-women of Reading, where the coach stopped to bait, who brought their old half-pence to the coach-doors, and induced the passengers to exchange them for silver, by offering a dish of fruit, a bunch of flowers, or a few new-laid eggs as a premium. We recollect as well, that, long after, the practice prevailed in London, among blacksmiths' boys and workers in metal, of beating the new farthing of George III., by a few smart blows upon an anvil, into a passable old half-penny. These old coins, however, vanished shortly after the declaration of peace, though specimens of them are yet occasionally to be met with in the till of the retail shopkeeper.

Just before the new silver made its appearance in 1819, an attempt was made, on the part of the government, to suppress the circulation of the Irish copper coin in England. Of this coin there has been for the last

fifty years a prodigious amount in use. It is known by the harp of Erin, which takes the place of Britannia on the reverse, and is enormously deficient in weight—about three of the Irish half-pence balancing one of the pennies of 1799. For some time the people, as perhaps it was their interest to do, countenanced the attempt to do away with them, and 'harp half-pence,' as they were called, fell into disrepute as base coin. Owing, however, to their vast numbers, it was found impossible to get rid of them, and the attempt was finally abandoned. An old blind beggar, a rather comical character, who daily took his stand opposite the writer's window, averred that for his part he couldn't see the propriety of rejecting the Irish coin—and having got a friend to write upon the begging-board which hung from his neck the words, *Harp half-pence taken here*, came in for a tolerable shower of them—and when the attempt to do away with them was given up, took the credit of having worsted the authorities in their endeavours to carry out an unwise measure, by making a patriotic stand against it.

But the most prodigious uproar that was ever made about a half-penny took place in Ireland in the days of Dean Swift—an uproar in which the savage and witty dean was the principal person concerned, as all who have read the celebrated *Drapier Letters* know perfectly well. The history of that characteristic affair was briefly as follows:—In the year 1722, the Duchess of Kendal obtained from George I. an exclusive patent for coining half-pence and farthings for Irish circulation. This patent she sold to one William Wood. If we are to believe the Irish records of the time, Wood coined the half-pence of such abominable metal, that they were worth almost nothing, and threatened the Irish people with all the evils that could ensue from a debased currency—though what these evils were they appear to have had but a very confused notion. Archbishop King, however, declared that the new half-pence would 'sink the kingdom,' and the whole of Dublin was soon in a wild commotion in expectation of that alarming event. The character of their panic may be gathered from the *Irish Cry*, which was then in every mouth, and a part of which ran as follows:—

The half-pence are coming, the nation's undoing—  
There's an end of your ploughing, and baking, and  
brewing;  
In short, you will all go to wrack and ruin—  
Which nobody can deny!

Both high men and low men, and thick men and tall  
men,  
And rich men and poor men, and free men and thrall  
men,  
Will suffer; and this man, and that man, and all men—  
Which nobody can deny!

The archbishop wrote vigorously and well in defence of what he supposed to be the independence of his country, threatened by the rascally brass half-pence. But the English government, not recognising the ruinous nature of the patent, would have enforced the circulation of the so-called spurious coin, when the first of the *Drapier's Letters* appeared, in the summer of 1724. This was followed by a second Letter in August of the same year. The excitement on the subject now became terrible and formidable. Lord Orrery says: 'At the sound of the Drapier's trumpet, a spirit arose among the people, that, in the Eastern phrase, was like a tempest in the day of the whirlwind. Every person, of every rank, party, and denomination, was convinced that the admission of Wood's copper must prove fatal to the commonwealth. The papist, the fanatic, the Tory, the Whig—all listed themselves volunteers under the banners of M. B. Drapier, and all were equally zealous to serve the common cause.' Soon after the appearance of the Drapier's third Letter, a change took

place in the British cabinet, and it was attributed by the Irish solely to the influence of that witty and sarcastic production. The Earl of Carteret was now despatched as governor to Dublin, in the hope that he would be able to restore peace, and induce the acceptance of the coinage. He was met almost instantly on his arrival by the publication of the Drapier's fourth Letter, a document more audacious and uncompromising than either of its forerunners. The earl offered £300 reward for the discovery of the author of that 'wicked, malicious, and seditious pamphlet;' but the author was not betrayed. The unfortunate printer was cast into prison, and died shortly after his release, it was averred from the cruel effects of his confinement. When the grand jury of the city and county of Dublin met, they presented all such persons as should attempt to impose Wood's coin upon the kingdom as enemies of his majesty's government, and acknowledged with gratitude the services of such patriots as had exerted themselves to prevent the passing of the base coin. The strife terminated in September 1725, by the government relinquishing their attempts to enforce the patent. The dean grew upon a sudden immensely popular, and no doubt enjoyed his popularity for a season—though it is easy to imagine how much he must have rued the circumstances that gave rise to it in his later promotion-hunting days.

It is more than probable that the dean cared not a straw for the cause he advocated, and that he had not a particle of apprehension as to the effects of the obnoxious coinage; but he could not resist the opportunity of harassing a government which he hated, because they were oblivious of himself; and therefore he made of the brass half-pence a convenient stalking-horse to carry his vehement, patriotic, and caustic diatribes.

The effects of a debased currency, however, even when that currency is copper, are not to be ignored. There is always an intimate connection between a good pennyworth and a good penny; and though the substitution of representative for real value is rarely accompanied by a rise in the price of commodities, yet that rise is sure to ensue from it in the long-run.

The copper coinage of France presents some curious anomalies, and it tells, besides, an interesting tale. The sous and two-sous pieces of the old regime are of pure copper, and when not clipped—for the clipping of even copper coin has been aforesaid a practice in France, as is sufficiently evident from the state of the old currency—are of full weight. The revolutionary half-pence, on the contrary, are of mixed metal, and many of them of light weight. There is, or lately was, a vast quantity manufactured from bell-metal seized by the governments of the day from the churches, when, the services of religion being suppressed, the church-bells offered the cheapest and readiest resource. The sovereigns who succeeded Napoleon coined millions of copper pence not much bigger than an English six-pence, and spread them over with a slight coating of white metal, the major part of which rubbed off in the course of the first year's wear. These continued in circulation for many years; but shortly before the Revolution of 1830, a band of Birmingham boys went over, and forged them in such numbers, and so successfully, that it was found impossible to separate the real from the spurious coin. The fact was, there was no difference whatever in the values between that which had been issued from the French Mint and that produced by the forgers—neither being worth much more than a tenth of the sum they represented. There has been from time to time no lack of spurious half-pence in our own country, but they have generally been made of lead; and their manufacture, which can yield but a very small profit, is chiefly the result of experiments by tyros in the art of casting spurious silver coin for the supply of the smashers.

A copper is but a trifle in itself, and the term is colloquially expressive of something verging on the despicable; but in a densely populated city, the comfort, the very existence of thousands is dependent upon the maintenance of an abundant circulation of copper-money. It is almost the only money which multitudes ever receive in reward for their services, or in compliance with their supplications; and were it withdrawn in any considerable quantities from the general market, its absence would be signalled by corresponding evidences of deprivation among the multitudinous classes with whom it is the principal if not the only medium of exchange.

#### THE SCHOOLMASTER OF ART.

It was observed of the English textile manufactures in the Great Exhibition, that however excellent they may have been in themselves, no justice was done to them in the arrangement. The French carpets, for instance, were not only beautiful individually, but they were displayed in such a manner as to have the effect in the aggregate of a single beautiful carpet with the colours artistically grouped; while the English fabrics of the same kind were thrown together without the slightest knowledge or feeling of their mutual dependence. This marks a defect in our national taste, which appears to us to go far in rendering nugatory the lessons of the Schoolmaster of Art, who is now striding throughout the length and breadth of the land.

But how can it be otherwise, since the Schoolmaster is himself English, and since his taste labours under the same national restriction? Look at his carpets, his paper-hangings, his draperies of all kinds—they are in themselves not seldom admirable; but to do them justice, they should be allowed to lie in the warehouse, and be admired among their congeners, for the old gentleman has little more knowledge than his pupils of the part they could properly take in general ornamentation. It is quite distressing to look at the gorgeous carpets that now enrich so many shop-windows, and mark the unearthly flowers that have sprung up over their whole surface at the Schoolmaster's approach, like the impromptu couch spread for Jove and his Saturnia on Mount Ida—

Glad earth perceives, and from her bosom pours  
Unbidden herbs and voluntary flowers;  
Thick new-born violets a soft carpet spread,  
And clustering lotos swell the rising bed,  
And sudden hyacinths the turf bestrew,  
And flamy crocus makes the mountain glow.

Such carpets, it is true, are beautiful objects in themselves, and make us proud of the skill and industry that have been exercised in their construction. But what to do with them? The ornaments of our room—on which some of us spend thousands of pounds—our pictures, gilding, chandeliers, cabinets of precious wood, small objects of virtue; and to all these things the magnificent carpet acts like a wet blanket. The landscapes on the walls, with their embowering groves and receding distances, become as flat as pancakes; the colours of the cabinets are extinguished; and the minutest ornaments lose fifty per cent. of their value at one blow. The Schoolmaster says not a word of all this. He sees only the carpet he is superintending, with its elegance of form and miracles of colouring; and as his eyes never open wide enough to take in the picture of which it is to form a part, he is content. Did he ever watch the proceedings of Nature in her pictures? Did he ever observe the effect of the ornamentation she lavishes on the eastern and western sky at the rising or the setting sun? Did he ever mark the subdued tints of the carpet she spreads on such occasions—a soberness that renders more glorious the

illumination of the horizon, and receives from it in exchange additional grace and charm?

In the rooms in Eastern countries, where there are no ornaments at all, and where almost the only furniture is a divan along the walls, our splendid carpets and hangings would be in their proper place; but here, their very beauty individually makes a general deformity. It cannot be denied, however, that, taken as individual objects, they exhibit of late years a very remarkable improvement in the national taste. Nothing can be more wholesome than those gorgeous carpets, with their suggestions rather than pictures of flowers, their dreams rather than delineations of the beautiful in nature. In hangings, we have got rid of Lady Emmeline's 'cocked-hats collapsed, and deformed tadpoles on tiptoes;' and with them the necessity that was imposed upon our imagination of giving such things a name. More especially, we have got rid of the deplorable resemblances of human faces thrown together by the casual meeting of impish angles, which haunted us on our sick-beds as we stared at the ghastly wall, and which, if the truth were known, have handed over not a few nervous patients into the hands of the mad-doctor. This is much; and the real beauty that has taken the place of such monstrosities, is more. What we have to do is, either to adapt the coverings of the floors and walls to our rooms, or our rooms to the coverings of the floors and walls. If you must have carpets and hangings of a gorgeous character, down with your pictures, and out with every stick of furniture but the plain and massive. If, on the other hand, you must have pictures, and chandeliers, and cabinets, and objects of virtue, down with your rich hangings, and out with your splendid carpets, substituting for the one nothing more obtrusive than drab of a subdued pattern; and for the other, something like French white and stone-colour, interwoven in figures that will please the eye without exciting the curiosity.

But of all the mistakes committed by the Schoolmaster for the want of a widely enough opened vision, the architectural one is the worst, because the least repairable. The old gentleman, considering that sculpture and architecture are both fine arts, treats them exactly alike. Their works are works of genius. Different styles and proportions are required for a Hercules and an Apollo, for a Parthenon and a cathedral; and having obtained his material data, the master—as contradistinguished from the mason—proceeds to business. But there is this difference, Dominic, between a house and a statue, that the one is movable, and the other not—that the one may be placed in a church, or a room, or a museum, while the other is a part of the site on which it stands, the centre of the picture it adorns. There is a difference, likewise, in the genius of the two artists. The architect proceeds by mathematical rule, just like the musical composer; and so does the sculptor—but only up to a certain point. In the composition of a statue, where the workman ends the master begins. To symmetry of parts, he adds attitude and expression; and as the god stirs within him, he is able, by means of which he is perhaps himself unconscious, to

Snatch a grace beyond the reach of art.

The sculptor may be said to resemble the composer and the singer in one. He gives sound, motion, life, to abstract beauty, and music breathes from the still, cold marble. The province of the architect is more restricted, yet ample enough to satisfy the ambition of genius. Being denied mobility in his lines, his power is displayed in a single expression, whether of grace, beauty, grandeur, sublimity; but in this the magnitude of his form gives him a great advantage. The comparative smallness of the sculptor's material adds to his plastic power: a statue of vast proportions would be an edifice.

In building a permanent abode for himself, man is careful to adapt it to the nature of the ground on which it is reared. With this view he sinks his foundations according to the soil, and makes all his arrangements correspond with the circumstances by which he is surrounded. But when the grand point in view is architectural beauty, it is wonderful how independent he feels of everything extraneous. He deals with the edifice as if it was a bit of sculpture which could be moved at pleasure, and exhibited wherever he chose. It never occurs to him that even the movable sculpture is placed with reference to light and background—in short, to the picture of which it is to be the centre; and that in placing an immovable structure, of great magnitude and importance, his taste ought to be governed by a similar law. This is the point in which the Schoolmaster fails. He looks at the edifice just as he does at the carpet—as an individual object, which must be constructed according to the rules of art; and he does not look at the effect desired, at the picture it is intended to form. In the matter of the carpet, the remedy is easy: spread it in a room where its gorgeousness will not injure the ornamentation, or turn out the ornamentation to make room for it as the main object. But when a building is once placed, there it must stand, to be either a sorrow or a joy for ever.

We do not mean to say that the Schoolmaster does not wish the work to be erected where it will be seen to advantage. He does wish this, but not as a condition of art. It will be all the better, he thinks, if it can be brought about; but if not—if a good site is too dear, or too much out of the way—he must just be content: the building itself is the main thing—that is his business. Now, in our opinion, the site is as much the architect's business as the edifice. This immovable object belongs to the ground, and is to form a picture; and if the ground is not adapted for it, it must be adapted for the ground. It is improper to say, as we often do: What a pity that so fine a building should be lost in such a situation! It is no pity, but a crime against art: if the situation was not suitable for the building, why place that particular building there, as if architecture afforded us no choice?

The same narrowness of vision has deluged the country with arguments about the relative merits of different styles of architecture. Those who indulge in such polemics have their eyes fixed upon a particular order, profoundly unconscious of everything else. Site, country, purpose, adjuncts, are nothing to them. Greek or Gothic, that is the question:

Under which style, Bezonian, speak or die!

Churches, palaces, streets, villas, huts—all must be put into one and the same uniform, because that uniform is at once the most convenient and the most sightly. And the arguments on both sides are stated in good set-terms: it is impossible to find a flaw in them, if you only take them as they stand, and shut your eyes to everything else. But, convenient for what, Dominic? Sightly under what circumstances? Is the style that would sanctify a cathedral equally appropriate for a tavern? Are a temple of the fine arts and a Burgher meeting-house to be erected on the same principles of taste? We are even told by one of the parties that, being descendants of the Barbarians, it is absurd to go back within that classic pale which it was the mission of our fathers to destroy. But if the Barbarians had found no classicism to come into collision with, if their wild genius had not been refined by the betraying charms they subdued, what direction would the civilisation of Europe have taken? The truth is, this present world is compounded of the old and the new; the sunset hues of the one mingle with the golden dawn of the other; and instead of being imprisoned in material forms, the taste of an eclectic age roams over all nature and over all art.

But an enlightened eclecticism is not satisfied with objects individually: it compares, classifies, arranges. What the Schoolmaster has to do, is to open his eyes a little wider, to take in the picture as well as the individual details that are to be introduced, and so teach the growing intelligence of the time to adapt the one to the other.

### THINGS AS THEY ARE IN AMERICA.

RICHMOND, IN VIRGINIA.

'WHEN does the carriage leave the door for the steamer down the Potomac?' I asked the book-keeper of Willard's Hotel in Washington.

'At six o'clock in the morning, and nine in the evening,' was the reply.

I preferred setting out in the morning, and was ready accordingly—Mr Willard being up at this early hour, and considerably providing each guest at his departure with a cup of coffee (without charge).

The ride to the landing-place of the steamers, across an open stretch of ground, occupies about half an hour, and on my arrival, I found that a number of persons who had just come by the northern train, were going on board a steamer, which was lying at the extremity of a wooden pier. Speedily everything was adjusted. A very droll-looking negro lad, in a kind of cocked-hat, and boots pulled over a pair of ragged pants, drew in the rope, and we were off.

The Potomac, more like an inland sea than a river, and here a mile in width, forms the connecting-link between the northern and southern railways. The line, as yet, stopped at Washington; and to get again upon the track, it was necessary to descend the Potomac fifty-five miles, to a place called Acquia Creek, where the railway to Richmond commences. An English traveller has said such sore things of the steamers on the Potomac, that I did not feel quite at ease in making so long an excursion in one of them: but I am bound in justice to say, that so far as my experience went, there was nothing to complain of. For a company of about fifty persons, two tables were prepared for breakfast in a manner that would have done no discredit to a first-class hotel. A good-humoured negro barber plied his vocation in his little apartment. And the toilet apparatus comprehended no wooden bowls—such articles having utterly vanished, if they ever existed anywhere but in the imagination.

In fine weather, the sail down the Potomac from Washington must be exceedingly pleasant; for the river, though broad, is not so wide as to give indistinctness to the scenery on the banks. On the right, we have the woody heights of Virginia, and on the left, the hills of Maryland, with frequent glimpses of villas, residences and farm-settlements on both sides. At the distance of six or seven miles below Washington, but on the Virginia side, we come abreast of Alexandria, a town of 10,000 inhabitants, with a good deal of shipping at its quays, and signs of manufacturing industry on a considerable scale. Eight miles further down, on the same side, is seen upon a green knoll among the picturesque woody eminences, an object of interest which, cold as the morning is, attracts nearly all the passengers from the well-warmed cabin. This is Mount Vernon, once the residence of General Washington, and where, in a vault amidst the grounds, the remains of the great man were intombed. It is a neat country residence, with a tall veranda in front, changed in no

respect from what it was sixty years ago; but a local authority speaks of the grounds, which were kept in the greatest trimness by Washington, being now in a discreditable state of disorder—a circumstance which, if true, demands the attention of the American people. Unfortunately, the spot is not easily reached by land, otherwise I should have gladly made it the object of a pilgrimage.

As the day advanced, the chilliness of the atmosphere wore off, and on arriving at Acquia Creek, the air felt mild and agreeable, although it was the 1st of December. The train was in waiting on a long jetty, and in less than ten minutes it had received its freight of passengers and luggage, and was under-way. Such was my entrance into Virginia—that fine old state, settled by English gentlemen of family, and whose history calls up such melancholy thoughts of the unfortunate Raleigh.

Much of the country through which we passed was uncleared of woods, which had a wild appearance, and the land, where opened to agricultural operations, seemed to be of a poor description. Among the trees growing naturally in the patches of tangled forest, was the *arbor vitæ*, which here attains a considerable size. Rhododendrons hung their faded blossoms by the roadsides, where they grew like common weeds; and in other kinds of vegetation, there was still the lingering aspect of autumn. On crossing the Rappahannock, at Fredericksburg, the agricultural character of the country was much improved; but even at the best, and all the way to Richmond, a distance of sixty miles from the Potomac, it fell short of what I had seen in Western Canada and Ohio. Yet possessing, as it does, the elements of fertility, what might not be expected from the land, if put under an enlightened system of tillage! The ploughing, performed by slaves under the inspection of overseers riding about the fields on horseback, was very defective; for it seemed scarcely to tear up the soil, and left large pieces altogether untouched. As the train passed, the negro ploughmen invariably stopped in their labour to look at, and speculate on, the phenomenon, as if their heart was not in their work, and they took every opportunity of shirking it. From the way they seemed to be proceeding, I feel pretty safe in averring, that two ordinary Scotch ploughmen would get through as much labour in a day as any six of them, and do the work, too, in a greatly superior manner.

In the course of the journey, a number of passengers were set down at different stations, leaving so few in the train, that at length another gentleman and myself found ourselves alone in one of the cars. My companion was a man of probably forty years of age, stout make, with sandy hair and whiskers, and had I seen him in England, I should have said he was a working-mechanic, probably a stone-mason, dressed in his Sunday clothes, and out on a holiday. I am particular in referring to his appearance, in order, if possible, to throw some light on the habits in which he very freely indulged. Apparently engaged in deep thought, he continued chewing tobacco with a voracity I had never seen equalled, and which provoked such an incessant torrent of expectoration, that at last the floor around him presented a most unsightly spectacle.

I think travellers, generally, in their descriptions exaggerate the chewing and spitting of the Americans. It is, in reality, only here and there you meet a person who abandons himself to these nauseous practices, while to the mass of the more respectable people in

the States, they are probably as disagreeable as to any well-bred European. The invectives, however, directed against the Americans on this score, dispose me to believe that the English who visit the United States, and pick out so many faults, are either ignorant or neglectful of the manners of their own country. Among the less-instructed classes in Great Britain, spitting in the streets, and other places, is exceedingly common; and since young gentlemen betook themselves to smoking tobacco in common clay-pipes, the vice may be said to have become fashionable in the junior departments of high-life—at any rate, we do not see that it meets with public censure. Now, if it be considered that in the United States, the rise from one condition of life to another is astonishingly rapid, and that all classes travel together in the same cars, and live together in the same hotels, it will not be difficult to understand how certain obnoxious practices should obtrude themselves on the notice of the more polished class of travellers.

The train arrived at Richmond about two o'clock in the afternoon; and by an omnibus in attendance, I was transferred to a hotel, which proved to be no way inferior to the establishments in the States further north. The whole of the waiters were negroes, in white jackets; but among the female domestics I recognised one or two Irish girls—the sight of them helping to make good what I had everywhere heard stated about the Irish dispossessing the coloured races. At Willard's Hotel, in Washington, all the waiters, as well as the female servants, were Irish, and here, also, they will probably be so in a short time.

Situated on a high and sloping bank on the left side of the James River, Richmond is much less regular in outline than the greater number of American cities. Its streets, straggling in different directions on no uniform plan, are of an old-established appearance, with stores, churches, and numerous public buildings. Besides the principal thoroughfares, there are many narrow streets or lanes of a dismal, half-deserted appearance, generally dirty, and seemingly ill drained and ventilated. Everywhere, the number of black faces is considerable; for in a population of 27,000, as many as 9000 are said to be slaves. The dwellings occupied by the lower classes of coloured people are of a miserable kind, resembling the worst brick-houses in the back-lanes of English manufacturing towns. In the upper part of the city there are some rows of handsome villas, and in this quarter is a public square, with the Capitol, or seat of legislature, in a central and conspicuous situation. In walking through this public edifice towards dusk, I observed that it was guarded by an armed sentinel, the sight of whom had almost the startling effect of an apparition; for it was the first time I had seen a bayonet in the United States, and suggested the unpleasant reflection, that the large infusion of slaves in the composition of society was not unattended with danger.

A fine view is obtained from the front of the Capitol, overlooking the lower part of the city, the river with its falls, and the country in the distance. The falls of the James River appear to have determined the situation of the town. These falls unitedly amount to a descent of eighty feet, and are made available for turning a number of large mills for grinding flour, and other purposes. The occurrence of such falls is only one of a series of similar phenomena, along the east coast of America; where, by recessions of the sea, a terrace-range crosses the rivers at a less or greater distance from the ocean, causing an abrupt descent, which is valuable as a water-power. The falls of the James River cease in front of the city, where there are several rocky and woody islets, and at this point two long wooden bridges afford communication with a manufacturing suburb on the right bank.

Although, in many respects, inferior in point of

appearance as compared with the smart New-England cities, Richmond shewed various symptoms of prosperity and progress. A species of dock for shipping was in process of excavation adjoining the bridges, and several large cotton-factories were in the course of erection. In the streets in this lower quarter, there was an active trade in the packing and sale of tobacco, quantities of which, like faded weeds, were being carted to the factories by negroes. The cotton manufacture is carried on in several large establishments, and will soon be extended, but principally, I was told, by means of northern capital, and the employment of hired white labourers, who, for factory purposes, are said to be preferable to persons of colour.

Richmond is known as the principal market for the supply of slaves for the south—a circumstance understood to originate in the fact that Virginia, as a matter of husbandry, breeds negro labourers for the express purpose of sale. Having heard that such was the case, I was interested in knowing by what means and at what prices slaves are offered to purchasers. Without introductions of any kind, I was thrown on my own resources in acquiring this information. Fortunately, however, there was no impediment to encounter in the research. The exposure of ordinary goods in a store is not more open to the public than are the sales of slaves in Richmond. By consulting the local newspapers, I learned that the sales take place by auction every morning in the offices of certain brokers, who, as I understood by the terms of their advertisements, purchased or received slaves for sale on commission.

Where the street was in which the brokers conducted their business, I did not know; but the discovery was easily made. Rambling down the main street in the city, I found that the subject of my search was a narrow and short thoroughfare, turning off to the left, and terminating in a similar cross thoroughfare. Both streets, lined with brick-houses, were dull and silent. There was not a person to whom I could put a question. Looking about, I observed the office of a commission-agent, and into it I stepped. Conceive the idea of a large shop with two windows, and a door between; no shelving or counters inside; the interior a spacious, dismal apartment, not well swept; the only furniture a desk at one of the windows, and a bench at one side of the shop, three feet high, with two steps to it from the floor. I say, conceive the idea of this dismal-looking place, with nobody in it but three negro children, who, as I entered, were playing at auctioning each other. An intensely black little negro, of four or five years of age, was standing on the bench, or block, as it is called, with an equally black girl, about a year younger, by his side, whom he was pretending to sell by bids to another black child, who was rolling about the floor.

My appearance did not interrupt the merriment. The little auctioneer continued his mimic play, and appeared to enjoy the joke of selling the girl, who stood demurely by his side.

'Fifty dolla for de gal—fifty dolla—fifty dolla—I sell dis here fine gal for fifty dolla,' was uttered with extraordinary volubility by the woolly-headed urchin, accompanied with appropriate gestures, in imitation, doubtless, of the scenes he had seen enacted daily in the spot. I spoke a few words to the little creatures, but was scarcely understood; and the fun went on as if I had not been present: so I left them, happy in rehearsing what was likely soon to be their own fate.

At another office of a similar character, on the opposite side of the street, I was more successful. Here, on inquiry, I was respectfully informed by a person in attendance, that the sale would take place the following morning at half-past nine o'clock.

Next day I set out accordingly, after breakfast, for the scene of operations, in which there was now a little more life. Two or three persons were lounging about,

smoking cigars; and, looking along the street, I observed that three red flags were projected from the doors of those offices in which sales were to occur. On each flag was pinned a piece of paper, notifying the articles to be sold. The number of lots was not great. On the first, was the following announcement:—'Will be sold this morning, at half-past nine o'clock, a Man and a Boy.'

It was already the appointed hour; but as no company had assembled, I entered and took a seat by the fire. The office, provided with a few deal-forms and chairs, a desk at one of the windows, and a block accessible by a few steps, was tenantless, save by a gentleman who was arranging papers at the desk, and to whom I had addressed myself on the previous evening. Minute after minute passed, and still nobody entered. There was clearly no hurry in going to business. I felt almost like an intruder, and had formed the resolution of departing, in order to look into the other offices, when the person referred to left his desk, and came and seated himself opposite to me at the fire.

'You are an Englishman,' said he, looking me steadily in the face; 'do you want to purchase?'

'Yes,' I replied, 'I am an Englishman; but I do not intend to purchase. I am travelling about for information, and I shall feel obliged by your letting me know the prices at which negro servants are sold.'

'I will do so with much pleasure,' was the answer; 'do you mean field-hands or house-servants?'

'All kinds,' I replied; 'I wish to get all the information I can.'

With much politeness, the gentleman stepped to his desk, and began to draw up a note of prices. This, however, seemed to require careful consideration; and while the note was preparing, a lanky person, in a wide-awake hat, and chewing tobacco, entered, and took the chair just vacated. He had scarcely seated himself, when, on looking towards the door, I observed the subjects of sale—the man and boy indicated by the paper on the red flag—enter together, and quietly walk to a form at the back of the shop, whence, as the day was chilly, they edged themselves towards the fire, in the corner where I was seated. I was now between the two parties—the white man on the right, and the old and young negro on the left—and I waited to see what would take place.

The sight of the negroes at once attracted the attention of Wide-awake. Chewing with vigour, he kept keenly eyeing the pair, as if to see what they were good for. Under this searching gaze, the man and boy were a little abashed, but said nothing. Their appearance had little of the repulsiveness we are apt to associate with the idea of slaves. They were dressed in a gray woollen coat, pants, and waistcoat, coloured cotton neckcloths, clean shirts, coarse woollen stockings, and stout shoes. The man wore a black hat; the boy was bareheaded. Moved by a sudden impulse, Wide-awake left his seat, and rounding the back of my chair, began to grasp at the man's arms, as if to feel their muscular capacity. He then examined his hands and fingers; and, last of all, told him to open his mouth and shew his teeth, which he did in a submissive manner. Having finished these examinations, Wide-awake resumed his seat, and chewed on in silence as before.

I thought it was but fair that I should now have my turn of investigation, and accordingly asked the elder negro what was his age. He said he did not know. I next inquired how old the boy was. He said he was seven years of age. On asking the man if the boy was his son, he said he was not—he was his cousin. I was going into other particulars, when the office-keeper approached, and handed me the note he had been preparing; at the same time making the observation that the market was dull at present, and that there never could be a more favourable opportunity of buying. I

thanked him for the trouble which he had taken; and now submit a copy of his price-current:—

'Best Men, 18 to 25 years old,	1900 to 1300 dollars
Fair do. do. do.,	950 to 1050 ...
Boys, 5 feet,	850 to 950 ...
Do., 4 feet 8 inches,	700 to 800 ...
Do., 4 feet 5 inches,	600 to 650 ...
Do., 4 feet,	375 to 450 ...
Young Women,	800 to 1000 ...
Girls, 5 feet,	750 to 850 ...
Do., 4 feet 9 inches,	700 to 750 ...
Do., 4 feet,	350 to 425 ...

(Signed)

Richmond, Virginia.'

Leaving this document for future consideration, I pass on to a history of the day's proceedings. It was now ten minutes to ten o'clock, and Wide-awake and I being alike tired of waiting, we went off in quest of sales further up the street. Passing the second office, in which also nobody was to be seen, we were more fortunate at the third. Here, according to the announcement on the paper stuck to the flag, there were to be sold, 'A woman and three children; a young woman, three men, a middle-aged woman, and a little boy.' Already a crowd had met, composed, I should think, of persons mostly from the cotton-plantations of the south. A few were seated near a fire on the right-hand side, and others stood round an iron stove in the middle of the apartment. The whole place had a dilapidated appearance. From a back-window, there was a view into a ruinous courtyard; beyond which, in a hollow, accessible by a side-lane, stood a shabby brick-house, on which the word *Jail* was inscribed in large black letters on a white ground. I imagined it to be a dépôt for the reception of negroes.

On my arrival, and while making these preliminary observations, the lots for sale had not made their appearance. In about five minutes afterwards they were ushered in, one after the other, under the charge of a mulatto, who seemed to act as principal assistant. I saw no whips, chains, or any other engine of force. Nor did such appear to be required. All the lots took their seats on two long forms near the stove; none shewed any sign of resistance; nor did any one utter a word. Their manner was that of perfect humility and resignation.

As soon as all were seated, there was a general examination of their respective merits, by feeling their arms, looking into their mouths, and investigating the quality of their hands and fingers—this last being evidently an important particular. Yet there was no abrupt rudeness in making these examinations—no coarse or domineering language was employed. The three negro men were dressed in the usual manner—in gray woollen clothing. The woman, with three children, excited my peculiar attention. She was neatly attired, with a coloured handkerchief bound round her head, and wore a white apron over her gown. Her children were all girls, one of them a baby at the breast, three months old, and the others two and three years of age respectively, rigged out with clean white pinafores. There was not a tear or an emotion visible in the whole party. Everything seemed to be considered as a matter of course; and the change of owners was possibly looked forward to with as much indifference as ordinary hired servants anticipate a removal from one employer to another.

While intending purchasers were proceeding with personal examinations of the several lots, I took the liberty of putting a few questions to the mother of the children. The following was our conversation:—

'Are you a married woman?'

'Yes, sir.'

'How many children have you had?'

'Seven.'

'Where is your husband?'

Google

'In Madison county.'

'When did you part from him?'

'On Wednesday—two days ago.'

'Were you sorry to part from him?'

'Yes, sir,' she replied with a deep sigh; 'my heart was almost broke.'

'Why is your master selling you?'

'I don't know—he wants money to buy some land—suppose he sells me for that.'

There might not be a word of truth in these answers, for I had no means of testing their correctness; but the woman seemed to speak unreservedly, and I am inclined to think that she said nothing but what, if necessary, could be substantiated. I spoke, also, to the young woman who was seated near her. She, like the others, was perfectly black, and appeared stout and healthy, of which some of the persons present assured themselves by feeling her arms and ankles, looking into her mouth, and causing her to stand up. She told me she had several brothers and sisters, but did not know where they were. She said she was a house-servant, and would be glad to be bought by a good master—looking at me, as if I should not be unacceptable.

I have said that there was an entire absence of emotion in the party of men, women, and children, thus seated preparatory to being sold. This does not correspond with the ordinary accounts of slave-sales, which are represented as tearful and harrowing. My belief is, that none of the parties felt deeply on the subject, or at least that any distress they experienced was but momentary—soon passed away, and was forgotten. One of my reasons for this opinion rests on a trifling incident which occurred. While waiting for the commencement of the sale, one of the gentlemen present amused himself with a pointer-dog, which, at command, stood on its hind-legs, and took pieces of bread from his pocket. These tricks greatly entertained the row of negroes, old and young; and the poor woman, whose heart three minutes before was almost broken, now laughed as heartily as any one.

'Sale is going to commence—this way, gentlemen,' cried a man at the door to a number of loungers outside; and all having assembled, the mulatto assistant led the woman and her children to the block, which he helped her to mount. There she stood with her infant at the breast, and one of her girls at each side. The auctioneer, a handsome, gentlemanly personage, took his place, with one foot on an old deal-chair with a broken back, and the other raised on the somewhat more elevated block. It was a striking scene.

'Well, gentlemen,' began the salesman, 'here is a capital woman and her three children, all in good health—what do you say for them? Give me an offer. (Nobody speaks.) I put up the whole lot at 850 dollars—850 dollars—850 dollars (speaking very fast)—850 dollars. Will no one advance upon that? A very extraordinary bargain, gentlemen. A fine healthy baby. Hold it up. (Mulatto goes up the first step of the block; takes the baby from the woman's breast, and holds it aloft with one hand, so as to shew that it was a veritable sucking-baby.) That will do. A woman, still young, and three children, all for 850 dollars. An advance, if you please, gentlemen. (A voice bids 860.) Thank you, sir—860; any one bids more? (A second voice says, 870; and so on the bidding goes as far as 890 dollars, when it stops.) That won't do, gentlemen. I cannot take such a low price. (After a pause, addressing the mulatto): She may go down.' Down from the block the woman and her children were therefore conducted by the assistant, and, as if nothing had occurred, they calmly resumed their seats by the stove.

The next lot brought forward was one of the men. The mulatto beckoning to him with his hand, requested him to come behind a canvas screen, of two leaves,

which was standing near the back-window. The man placidly rose, and having been placed behind the screen, was ordered to take off his clothes, which he did without a word or look of remonstrance. About a dozen gentlemen crowded to the spot while the poor fellow was stripping himself, and as soon as he stood on the floor, bare from top to toe, a most rigorous scrutiny of his person was instituted. The clear black skin, back and front, was viewed all over for sores from disease; and there was no part of his body left unexamined. The man was told to open and shut his hands, asked if he could pick cotton, and every tooth in his head was scrupulously looked at. The investigation being at an end, he was ordered to dress himself; and having done so, was requested to walk to the block.

The ceremony of offering him for competition was gone through as before, but no one would bid. The other two men, after undergoing similar examinations behind the screen, were also put up, but with the same result. Nobody would bid for them, and they were all sent back to their seats. It seemed as if the company had conspired not to buy anything that day. Probably some imperfections had been detected in the personal qualities of the negroes. Be this as it may, the auctioneer, perhaps a little out of temper from his want of success, walked off to his desk, and the affair was so far at an end.

'This way, gentlemen—this way!' was heard from a voice outside, and the company immediately hived off to the second establishment. At this office there was a young woman, and also a man, for sale. The woman was put up first at 500 dollars; and possessing some recommendable qualities, the bidding for her was run as high as 710 dollars, at which she was knocked down to a purchaser. The man, after the customary examination behind a screen, was put up at 700 dollars; but a small imperfection having been observed in his person, no one would bid for him; and he was ordered down.

'This way, gentlemen—this way, down the street, if you please!' was now shouted by a person in the employment of the first firm, to whose office all very willingly adjourned—one migratory company, it will be perceived, serving all the slave-auctions in the place. Mingling in the crowd, I went to see what should be the fate of the man and boy, with whom I had already had some communication.

There the pair, the two cousins, sat by the fire, just where I had left them an hour ago. The boy was put up first.

'Come along, my man—jump up; there's a good boy!' said one of the partners, a bulky and respectable-looking person, with a gold chain and bunch of seals; at the same time getting on the block. With alacrity the little fellow came forward, and, mounting the steps, stood by his side. The forms in front were filled by the company; and as I seated myself, I found that my old companion, Wide-awake, was close at hand, still chewing and spitting at a great rate.

'Now, gentlemen,' said the auctioneer, putting his hand on the shoulder of the boy, 'here is a very fine boy, seven years of age, warranted sound—what do you say for him? I put him up at 500 dollars—500 dollars (speaking quick, his right hand raised up, and coming down on the open palm of his left)—500 dollars. Any one say more than 500 dollars? (560 is bid.) 560 dollars. Nonsense! Just look at him. See how high he is. (He draws the lot in front of him, and shews that the little fellow's head comes up to his breast.) You see he is a fine, tall, healthy boy. Look at his hands.'

Several steps forward, and cause the boy to open and shut his hands—the flexibility of the small fingers, black on the one side, and whitish on the other, being well looked to. The hands, and also the mouth, having

given satisfaction, an advance is made to 570, then to 580 dollars.

'Gentlemen, that is a very poor price for a boy of this size. (Addressing the lot): Go down, my boy, and shew them how you can run.'

The boy, seemingly happy to do as he was bid, went down from the block, and ran smartly across the floor several times; the eyes of every one in the room following him.

'Now, that will do. Get up again. (Boy mounts the block, the steps being rather deep for his short legs; but the auctioneer kindly lends him a hand.) Come, gentlemen, you see this is a first-rate lot. (590—600—610—620—630 dollars are bid.) I will sell him for 680 dollars. (Right hand coming down on left.) Last call. 680 dollars once—630 dollars twice. (A pause; hand sinks.) Gone!'

The boy having descended, the man was desired to come forward; and after the usual scrutiny behind a screen, he took his place on the block.

'Well, now, gentlemen,' said the auctioneer, 'here is a right prime lot. Look at this man; strong, healthy, able-bodied; could not be a better hand for field-work. He can drive a wagon, or anything. What do you say for him? I offer the man at the low price of 800 dollars—he is well worth 1200 dollars. Come, make an advance, if you please. 800 dollars said for the man (a bid), thank you; 810 dollars—810 dollars—810 dollars (several bids)—820—830—850—860—going at 860—going. Gentlemen, this is far below his value. A strong-boned man, fit for any kind of heavy work. Just take a look at him. (Addressing the lot): Walk down. (Lot dismounts, and walks from one side of the shop to the other. When about to reascend the block, a gentleman, who is smoking a cigar, examines his mouth and his fingers. Lot resumes his place.) Pray, gentlemen, be quick (continues the auctioneer); I must sell him, and 860 dollars are only bid for the man—860 dollars. (A fresh run of bids to 945 dollars.) 945 dollars once, 945 dollars twice (looking slowly round, to see if all were done), 945 dollars, going—going (hand drops)—gone!'

During this remarkable scene, I sat at the middle of the front form with my note-book in my hand, in order to obtain a full view of the transaction. So strange was the spectacle, that I could hardly dispel the notion that it was all a kind of dream; and now I look back upon the affair as by far the most curious I ever witnessed. The more intelligent Virginians will sympathise in my feelings on the occasion. I had never until now seen human beings sold; the thing was quite new. Two men are standing on an elevated bench, one white and the other black. The white man is auctioning the black man. What a contrast in look and relative position! The white is a most respectable-looking person; so far as dress is concerned, he might pass for a clergyman or church-warden. There he stands—can I believe my eyes?—in the midst of an Anglo-Saxon, sawing the air with his hand, as if addressing a missionary or any other philanthropic meeting from a platform. Surely that gentlemanly personage cannot imagine that he is engaged in any mortal sin! Beside him is a man with a black skin, and clothed in rough garments. His looks are down-cast and submissive. He is being sold, just like a horse at Tattersall's, or a picture at Christie and Manson's—I must be under some illusion. That dark object, whom I have been always taught to consider a man, is not a man. True, he may be called a man in advertisements, and by the mouth of auctioneers. But it is only a figure of speech—a term of convenience. He is a man in one sense, and not in another. He is a kind of man—stands upright on two legs, has hands to work, wears clothes, can cook his food (a point not reached by monkeys), has the command of speech, and, in a way, can think and act like a rational creature—

can even be taught to read. But nature has thought fit to give him a black skin, and that tells very badly against him. Perhaps, also, there is something wrong with his craniological development. Being, at all events, so much of a man—genus *homo*—is it quite fair to master him, and sell him, exactly as suits your convenience—you being, from a variety of fortunate circumstances, his superior? All this passed through my mind as I sat on the front form in the saleroom of Messrs —, while one of the members of that well-known firm was engaged in pursuing, by the laws of Virginia, his legitimate calling.

Such were a forenoon's experiences in the slave-market of Richmond. Everything is described precisely as it occurred, without passion or prejudice. It would not have been difficult to be sentimental on a subject which appeals so strongly to the feelings; but I have preferred telling the simple truth. In a subsequent chapter, I shall endeavour to offer some general views of slavery in its social and political relations.

W. C.

#### LIMITED LIABILITY.

THE commission appointed to consider this question has reported on the whole unfavourably to it. We must candidly confess that we are sorry for the decision, whether it be right or wrong. If right, we should be indeed the more sorry, since it would shew that the one thing above all others to which we looked for moral redemption to the labouring masses, is a fallacy. We hope, however, that the decision is wrong, and that the commission has only delayed a little longer what we think the most powerful means of raising the people.

The question is just this—shall there be freedom in this country, as there is, under certain restrictions, in France and America, for the possessors of spare sums to club them for certain mercantile purposes, without each proprietor becoming answerable for whatever the rest may do in regard to the concern? The commission says, that to allow a man to be a partner for that sum, with no responsibility beyond it, would be to lower the credit of the British merchant, and would be dangerous to the public. They speak as if all legitimate ends were served by the existing system. In short, with a slight exception, their cry is, let well alone.

The decision happens to be in remarkable accordance with the views of all the great capitalists. When two or three such men can accomplish a mercantile purpose of magnitude, or are already conducting such a concern, it is obviously their interest to prevent any five hundred other people from clubbing their smaller means, and coming into the field as competitors. The terror of unlimited responsibility, of course, act powerfully in preventing such associations. Ergo, great capitalists relish unlimited responsibility. This principle, in the language of the *Times*, 'creates a species of monopoly in favour of those who already possess capital.' We must therefore say, that we view the commission's decision with suspicion, if not something more.

The great mistake on that side, is in quietly assuming that the present system is one which protects the public. As the law now stands, a man may be carrying on—as many do carry on—a business far beyond the powers of his capital. It is not too much to say, that many have not one thousand pounds of true means, while their business would require at least twenty thousand. The law permits this man to borrow from a

'bill-discounter,' or to get support, as it is called, from some wholesale-house, which re-imburses itself by enormously overcharging some article which he takes from them in large quantities; and these usurers go on for years absorbing three-fourths of his profits, and preventing his concern from ever righting itself. When he ends, as he is pretty sure to do, in bankruptcy, it is found that the usurers have contrived to get out, or nearly so, while hundreds of honest creditors are in. To all intents and purposes, then, these men have been partners, and highly profiting partners too, and yet have escaped responsibility. On the other hand, the concern having all along had some good profits about it, the trader might have easily obtained a few thousands from *bona-fide* partners, if these could have been safe from loss beyond the amount of their investments. In this case, it would have been kept in a sound, instead of an unsound state: no one would have lost by it. But then small capitals would have had a chance—the feature which large capitalists cannot endure!

Can the public, moreover, really be said to be protected, when the perils of the existing laws are so great? The *Times* describes a few of them: 'One man has taken a few shares in a joint-stock for a bad debt, and has been first roused to a sense of the true nature of the transaction by finding himself responsible, to his last penny, for the debts of a thoroughly insolvent concern. Another has shares standing in his name as a trustee, and is astonished to find that he is called upon for a contribution under the Winding-up Act. Another is a shareholder in a highly flourishing bank, dividing regularly, keeping a reserve fund, possessing a manager of the greatest talent, and directors of unimpeachable integrity; but while he is felicitating himself on the excellence of his investment, the directors have reduced the assets to nothing by discounting each other's bills; and in order to protract exposure for a few weeks more, contract a large loan by pledging to a neighbouring bank all they have to pledge—the credit of their shareholders, who, at this very moment, believe the concern solvent, and are little aware that their last shilling has been handed over, by virtue of the law of partnership, to pay creditors of whose existence they have no idea.' Call you this protection? It seems to be forgotten that indiscretion and roguery are sometimes connected with the name of creditor, as well as with that of debtor.

The most curious circumstance connected with the other side of the question is, that unlimited liability, while proclaimed to be necessary to British credit, is departed from in numberless instances, though in a most arbitrary manner. Had it been entirely carried out, 'we should have had no railways, very few steamships, and the electric-telegraph would have still been in its infancy.' As the *Times* remarks: 'The prohibitive and the dispensing power cannot both be right. If there be involved in the question of limited liability any question of morality, it must be wrong to violate that morality in large cases as well as small; and if, on the other hand, these matters ought to be regulated by the contract between the parties, and notice of that contract given to the public, the agreement ought to have full effect in small matters as well as in great.'

We are little concerned to discuss the question beyond what we see to be the effects of unlimited responsibility on the humbler classes of society. What is the great distinction between a mercantile person and a well-paid workman? Mainly this, we would say—the trader has a strong tendency to take care of what he realises—to make the little a mickle—to strain on to the possession of property; and you see in his quiet frugal life, and the peculiar virtues connected with it, an immediate effect of the anxiety to possess. The highly-waged operative, on the other hand, is remarkable for his indifference to saving and accumulation—he spends the gains of the week within the week, lives

between the hand and the mouth, is often dissipated—anyhow, shews little of the temperate virtues which we see connected with property in the trader. There is, in short, a moral force in property; and the operative, not having the property, wants the moral force. But why does he not save, like the trader? Obviously, because, while the trader feels additional power in every pound he adds to his capital, the operative sees no immediate good from the saved pound. And this is because he cannot make any profitable use of it, at least none that awakens the feeling of gain, or holds forth the hope of a permanent improvement of condition. Now, were there limited liability, there would be thousands of small concerns, generally, perhaps, conducted by mercantile persons, but taking up the savings of the workers, and exciting in them those hopes which we see to have such a sustaining effect on humanity. In such circumstances, drinking habits would come to an end—as immense amount of capital now lost through dissipation and immorality would be saved and turned to profitable use—and one large and most important class in the community would be converted from recklessness and discontent, to a condition at once satisfactory to themselves and the rest of the community.

#### THE KITCHEN AT THE CRYSTAL PALACE.

THE Crystal Palace at Sydenham upsets all kinds of calculations made by all kinds of people. The enterprise is so novel, that the guesses made beforehand in respect to it are found in most cases to have either fallen far short of, or to have gone far beyond, the truth! The railway company thought that third-class passengers would so preponderate, as to render very little first-class accommodation necessary. They were wrong; for the first-class passengers are so many, that there are barely carriages enough to contain them. They thought that the rush of visitors would be so great, as to render necessary the sale of tickets at other places besides the London Bridge Station—a judicious plan, albeit that the booking-office for Crystal Palace trade works very smoothly and steadily. It was thought that so many thirsty souls would reach the building by road-conveyance, that hotel-keepers, tavern-keepers, coffee-shop-keepers, and ginger-beer sellers, began to speculate largely in the surrounding neighbourhood; but nearly all—an immense majority, at least—travel by railway, and do not leave the territories of the two companies from the time of starting from London Bridge to the time of their return to the same terminus; and we are inclined to think, that the extra-palatial refreshment—if we may coin so high-sounding a phrase—will be less than was at one time expected. It was thought that our larger manufacturers would exhibit their machines and engines as they did in Hyde Park, and would shew the routine of manufacturing operations. It may be so; but all this is written in the future—to be developed, we hope, as the various arrangements become completed. It was thought that the most monstrous of all monster-organs would be necessary to give the visitors any taste of Crystal Palace music; but this, too, was wrong; for Herr Schallehn's well-selected, braided-coated, gold-banded, martial-looking band of sixty performers produce such music as rolls gloriously along and around the vaulted arches of the Palace. It was thought—But here we will begin a new paragraph, for we touch upon the very matter which is destined to be the subject of the present article.

It was thought that, although the visitors would need a little refreshment during their sojourn within the building, this refreshment would be a subordinate affair, occupying a little space, and the services of a few persons. It was thought so by most persons, at least; although the directors seem to have had a notion that something great was 'looming in the distance' in

this matter. Be this as it may; whoever thought that the Refreshment Department would be small, and quiet, and unimportant, thought erroneously. It has become one of the characteristic features of the place—impossible to be overlooked even if we would overlook it, which no one seems inclined to do. And there is such an evident relish about it all—such a determination to attend to gastronomy, as well as to sculpture, architecture, botany, ethnology, manufactures, and fountains, that 'gastronomy' may be regarded as one of the 'institutions' of the place.

It is amusing to watch the expression of wonder on the faces of many of the visitors, as they, on their first visit, wend their way along the almost endless corridors, colonnades, galleries, and staircases, which intervene between the Palace railway-station and the main building of the Palace itself. We alight from a railway-carriage upon a stone or slated platform. We ascend sixty steps—wooden at present, but probably to be replaced by others of stone by and by; and then pass through a ticket-office, which separates the territories of the railway company from those of the Palace company. We then traverse a colonnade, glazed overhead, with movable windows on one side, and, by and by, with choice flowers and plants on both sides—a flowery path 400 or 500 feet in length. We then enter the extreme corner of the south wing of the Palace, by an ascent of something like forty steps from the colonnade. Here the first thing that meets the eye is a screen which partially hides a sort of third-class refreshment-room, with viands, and servitors, and eaters within, and viands and eaters without, seated around marble-topped round tables. We ascend forty more steps, and traverse a gallery, with marble-topped pastry counters and chocolate counters, marble-topped round tables, and servitors, and eaters, and drinkers. We mount forty more steps—for such a 'gettin' up-stairs' has been seldom before seen as is now seen at the Crystal Palace: the ascent of the hill is so formidable, that the railway could not have been carried up to a higher level without such gradients as would have staggered an engine-driver—and arrive on a level with the main floor of the building; but not in the main portion of the building itself, for we are still in the south wing. There, just at the corner where the wing is connected with the main building, we meet with such a gastronomic display as bewilders one: marble-topped counters, scores of feet in length; round tables, almost innumerable; carvers and waiters as thickly placed as they can be without tumbling over one another; the counters laden with comestibles; chairs so numerous that we have to thread our way between them; platefuls of good things on all the little round tables, and visitors attending to those good things with remarkable intelligence and energy. Such is the view just before entering the vaulted expanse of the Palace itself. We emerge from the south wing into the Palace, and still find our path strewn with counters, tables, chairs, carvers, waiters, eaters. We traverse the extreme southern margin of the building, from east to west, and still it is the same: tables, and waiters, and eaters; eaters, and waiters, and tables; waiters, and eaters, and tables—ring the changes how we may; and it is only when we turn resolutely northwards out of this department that we get to the exhibited contents of the Palace proper, and exchange body-food for mind-food.

We find it so difficult to croak or grumble when roaming within or thinking about the Crystal Palace, that we will get rid of any little croaking at once, and have done with it. Our croak, then, is this:—We could have wished that the railway-entrance and the Refreshment Department were at opposite ends of the building. We could have wished that a visitor, on entering the Palace, were met by smiling flowers, or beauteous sculpture, or grand architecture, or gushing fountains, or illustrations of natural history, or

products of manufacturing skill; and that when 'tired nature' needed a little restoration, it should be sought for in other parts of the building. We have alluded to the wonder which the gastronomic display excites in the minds of most visitors, and this wonder is in some cases combined with a wish that the arrangements were otherwise. As it is, we meet with a roast fowl; then with a beautiful screen of the kings and queens of England; then with a white-cravated waiter; then with a brown-skinned, bare-legged Sandwich islander; then with a lobster-salad; then with a palm-tree from the tropics; then with a small bottle of pale ale; then with a tiger climbing up a tree; then with a plate of ham; or, if these objects are not actually mingled up together, they are in such juxtaposition that the mind is somewhat puzzled to arrange itself in proper order for the due appreciation of what is to come. It may very likely be, that this arrangement is a natural consequence of the peculiar locality on which the structure is built: the railway-station could scarcely have been other than it is; for the great ascent of the ground rendered it necessary to approach by a wide curve the southern end of the building; and it may have been that the southern end offers more conveniences than the northern for the construction of a kitchen, and the general management of the Refreshment Department. We censure no one; we simply say that, *ceteris paribus*, it would better please the eye if the railway-entrance and the Refreshment Department were at opposite ends of the building. Those who approach the Palace by road, and enter at the western front, do not encounter this gastronomic display; but the road travellers are, as we have said, few compared with the railway travellers to the Palace.

This refreshment subject is a remarkable one in many particulars, and deserves a little notice. The department is kept wholly in the Company's hands, for reasons which will be better appreciated when we look back to what occurred three years ago.

The commissioners of the Great Exhibition in 1851, deeming it necessary to provide some kind of refreshments for the expected millions of visitors, but not willing to trouble themselves with the details of managing penny-buns and bottles of ginger-beer, advertised for tenders from parties willing to take the contract. The tender of Messrs Schweppe, the soda-water manufacturers, was accepted; they agreed to pay a certain sum for the privilege of supplying all the refreshments in the Hyde Park building, under certain regulations stipulated by the commissioners. Messrs Schweppe sublet their contract to Messrs Masters and Messrs Younghusband: one firm took the central refreshment-room, while the other took those at the east and west ends of the building. The Exhibition opened; no one could say whether the consumption of refreshments would be more or less than moderately large; but it soon became apparent that the contractors had made an advantageous bargain; the demand for eatables and drinkables was large, and the number of attendants necessary for serving out the supply for this demand became very considerable. It was well known and candidly acknowledged, that the speculation was a 'good thing'; but it was not until some time after the close of the Exhibition that the money results were published. One of the Reports made by the commissioners to the government contained special reports from the contractors and others; and among these was one relating to the Refreshment Department. The Exhibition was open rather less than six months; and during that time no less a sum than L.75,000 was expended in refreshments. This, too, was in very small items; for the average amount spent by each five-shilling visitor, at each visit, was only 4d.; 4½d. for each half-crown visitor; and 2½d. for each shilling visitor; some of the visitors expended nothing for refreshments; but if the whole sum of L.75,000 were

divided equally among 6,040,000 visitors, it would give an average of about 3d. each per visit. The expenditure within the building for refreshments varied from a minimum of L.198 to a maximum of L.909 per day—the lowest and highest days being 2d May and 19th June. The average expenditure on the shilling-days was exactly L.600 per day. As to the refreshments sold, they were mostly of a light character—something on the Wolverton standard. Of the 50,000 quarter-loaves, the 1,800,000 buns, the 33 tons of ham, the 2400 quarts of jelly, the 14,000 pounds of coffee, the 33,000 quarts of milk, the 32,000 quarts of cream, the 36,000 pounds of tongues and potted meat, the 360 tons of ice, the 1,100,000 bottles of soda-water and other aerated beverages—of all these, the list shews that light articles became very heavy by multiplication; while the more solid dinners in the Exhibition refreshment-room made an addition to the list in the substantial shape of 113 tons of meat, 36 tons of potatoes, and 1000 gallons of pickles.

Now, when the Sydenham Palace was being planned, the directors, like prudent men, looked steadily at this refreshment question. They saw very plainly that, out of an expenditure of L.75,000 for light viands and beverages, the net profit must have been considerable. They resolved, therefore, not to let off this department by contract; they adopted, in preference, the plan of rendering this a part and parcel of their great enterprise—on one ground, for the sake of any profit which might legitimately arise therefrom; and on another ground, that they might adapt the working-arrangements to the requirements of the place, varying them if variation seemed necessary. This principle being decided on, the directors proceeded to work it out with the same bold spirit which has been infused into all their proceedings. They built a large kitchen, with all appliances on the most complete scale; they built store-rooms and larders, pantries and bread-rooms, sculleries and ice-houses; they built dining-rooms and refreshment-rooms of various kinds and sizes; they provided marble-topped counters and tables in enormous extent; they ordered plate, and china, and glass, and vessels of all sorts, for the due serving of a prodigious amount of eatables and drinkables; they engaged, as general superintendent, one who has been conversant with hotel arrangements on a large scale; they secured the services of scientific cooks, and confectioners, and ice-makers; they organised in the kitchen a staff of cooks and assistants, and in the refreshment-rooms a staff of waiters and attendants, and in the store-rooms a staff of clerks and store-keepers; they entered into contracts with millers and bakers, butchers and poultryers, green-grocers and fruiterers, for the supply of provisions on a great scale; they made provision for a due supply of fuel, gas, and water—they did all this, and then they waited to see whether the world would make use of this gigantic restaurant.

The kitchen is one of the busiest imaginable places, almost every inch of space being well applied throughout the entire day. For reasons that will be obvious, such a place cannot be opened to the view of visitors generally; but we may say a few words in connection with a peep with which we have been favoured. The kitchen, then, is a rectangular apartment, mostly of brick, iron, and glass. On two sides, the walls are lined with stoves and ovens of the most approved kind—stoves in which the efficiency of gas-cookery is most amply proved. Many persons to whom this subject is new, would be much surprised at the principle and practice of cooking by gas, so difficult does it seem to understand how jets of gas can cook meat without imparting to it a gas-like odour. Let us steal a look, then, into this gas-stove before us, and see how it is all managed. The stove is a sort of quadrangular box, say forty inches high by thirty inches square. It has

not see. It has a dripping-pan covering the bottom; and at a few inches above the pan is a single row of gas-jets running round the four sides of the stove: this is the whole of the apparatus employed for heating. At a height of two or three feet above the jets is a kind of gridiron or grate; and on this gridiron are placed—not four-and-twenty fiddlers all in a row, but four-and-twenty fowls all in a square. Those who have the best means of judging, say that the cooking realises all that can be wished for; while the ease and facility of the processes are most important advantages. We were assured that, in this same stove, a few days before the writing of the present article, a piece of beef, weighing 300 pounds, was roasted in eight hours—not scorched without and half-done within, but honestly roasted from the skin to the bone—a great achievement this, we think, with the aid merely of a few dozen little jets of gas.

All the other appliances are very complete. There are baking-ovens, and soup-making stoves, and bread-baking stoves, and pasty-ovens, and beef-boiling coppers, and pots and pans of varied kinds, nearly all of them heated by gas. Then there are tables and boards whereon meat is cut up, poultry dressed, vegetables prepared, lobsters extricated from their shells, lobster-salads decked out, meat-pies made, and all sorts of nice things 'dished up' for the waiters to carry into the refreshment-rooms. Then, in the bread-rooms, confectionary-rooms, ice-rooms, and other subsidiary departments, all is arranged in as systematic a way as the operations of a large commercial establishment. Indeed, this is a large commercial establishment, the book-keeping of which must be something considerable. The letters C. P. C. are all around, as denoting that the entire apparatus, culinary and otherwise, is the property of the Crystal Palace Company; and a formidable sum it must have cost. In one cool brick-room we espy several men making ices and ice-creams—a work which occupies them all day long, especially when hot days render the visitors more than usually solicitous for cooling refreshments.

Now, the willingness on the part of the sight-seeing public to partake of these refreshments has shewn itself to be such, that the producing powers of the kitchen are often taxed to the utmost. The total number of persons engaged within the building, under the presidency of Mr Horne, in preparing and dispensing the refreshments, from the clerks who make record of all the provision sent in by the purveyors, to the battalion of waiters who attend in the refreshment-rooms, is not much less than three hundred; and there are certain hours of the day when all are as busy as busy men and women can be. The cooks have indeed an active time of it; they are at work from morn till a late hour in the evening; for they must take care, when one day's demand is supplied, to have a sufficient store cooked for the earlier hours of the next day's visitors. All the viands are cold, with a few exceptions which do not apply to visitors generally; and therefore the fowls, and hams, and so forth, must be cooked some few hours before they are to be eaten.

It is quite evident, both from the accounts of the Company, and from what meets the eye of a looker-on, that the visitors spend very much more in refreshments than was the wont in the old Crystal Palace. Whether it is that the rattling ride up to Sydenham gives folks an appetite, or that the cold collation is really cheap—a matter of opinion on which each one will judge for himself—or that visitors who are usually out of the way of roast-fowl and lobster-salad, resolve on a treat on these special occasions; whatever may be the reason, the fact certainly is, that the number of those who partake of a two-shilling luncheon or cold dinner, is beyond all conception greater than one would have expected. We speak here of the partakers of a meal for which a

smaller and lighter refreshments, such as disappear in the same way as they did in Hyde Park. The money taken for refreshments has, it is said, on one or two occasions actually equalled that taken for admission. Of the balance-sheet, as regards the Company, we know nothing, and can surmise nothing; it may be that the luncheon is not so profitable to the venders as lighter refreshments would be; but on this point we have nought to say. Be the profit great or small, the consumption of provisions is something astounding. A short time ago, 1060 fowls were roasted and eaten in two days! The consumption on one of the shilling-Thursdays, about a month after the opening of the Crystal Palace, included, among other items, 500 fowls, 150 pigeons, 60 large joints of roast-beef, 40 of boiled beef, 20 breasts of veal, 20 quarters of lamb, 20 loins of mutton, 150 moulds of jelly, 100 moulds of cream, and 400 lobsters, which took part in the formation of lobster-salads. Not even the monster-hotels of the United States can talk about such an absorption of eatables as this. We say nothing about the drinkables; for it is the solids rather than the beverages which disappear in this surprising way. Many well-meaning persons have quaked a little concerning the probable or possible drinking at the Crystal Palace; they may allay their fears, for the drinking is by no means a prominent feature; the visitors take a little, and only a little, and then set off again on their rambles through the Palace.

On looking back at our account of the appearance of the Refreshment Department on entering the building, we find that no mention has been made of a central department near the great transept, or of a northern department at the further end—'next door to Nineveh,' as some persons describe it. So profuse is the array of marble-topped counters and marble-topped circular tables, that on a late occasion we gave ourselves the somewhat hopeless office of determining their number; we got as far as 900 feet in length of counter, and 350 circular tables, and then, tired of the self-imposed task, we gave it up. These counters and tables are, as will be inferred from what has been before said, in three groups—southern, central, and northern. Many of the counters are, under arrangement with the Company, rented by the Paris Chocolate Company, by whom are vended chocolate hot and chocolate cold, chocolate with vanilla and chocolate with milk, chocolate bonbons and chocolate papillotes, chocolate crackers and chocolate pastilles, chocolate statuettes and chocolate cigars, chocolate with taraxacum and chocolate with sarsaparilla, chocolate diabolitons with nonpareils and without, chocolate at threepence per cup and chocolate at a shilling per cup.

The reader will, we trust, not misinterpret the purport of the present paper. He will not suppose that we are silent about the wonders and beauties of the Crystal Palace, because we deem the commissariat department more important. The truth is, that this remarkable undertaking seems likely to afford many unexpected illustrations of social, artistic, and commercial facts, worthy of a thought and a glance from all of us. Gastronomic achievements struck us as being one of the number; and we think the reader will not be disinclined to learn these few details concerning so singular a development. Other developments there will be in abundance, if we have space to touch upon them here now and then.

#### PRODUCTIONS OF JAPAN.

Japan abounds in natural and artificial productions of great value. Its mineral riches are enormous, and include metals of various kinds, especially gold, silver, and copper. Sulphur and nitre are also found in large quantities: there is no want of coal, and there are precious stones of almost every variety—agates, sapphires, jaspers, cornelians, and

even diamonds; while pearls are found in great plenty among the shells upon the coast. Then the fertility of the soil is very great. The mulberry-tree grows extensively, and affords food for countless myriads of silk-worms. The *hadi*, or paper-tree, serves innumerable useful purposes, including the manufacture of cloths, stuffs, and cordage. The *ceruri*, or varnish-tree, is another valuable production of the country, yielding large quantities of a milky juice which the natives employ to varnish, or *japan*, as we call it, various articles. Then there are the bay-tree, the camphor-tree, the fig-tree, the cypress-tree, with very many more, more or less valuable, and from which a great variety of useful articles are made; and last, though not least, there is the tea-shrub, from the leaves of which the common drink of the people is brewed, and which is capable of yielding a valuable article of commerce. Trees growing nuts of various kinds are abundant; the maple is extensive and excellent; bamboos are very plentiful, and of great use, as they are everywhere in the Indies. They cultivate as much hemp and cotton as they can find room for in their fields; and as to rice, which is the main food of the natives, that grown in Japan is considered the best in all Asia, and it can be produced in almost any quantity. Their corns are of several sorts: besides the *komi*, or rice, there are the *oomuggi*, a kind of barley; the *haomuggi*, their native wheat; and the *daidsou*, a species of bean—all of which abound with superior farina.—*Country Gentlemen—Albany.*

#### M I N E !

FOR A GERMAN AIR.

O how my heart is beating as her name I keep repeating,  
And I drink up joy like wine;  
O how my heart is beating as her name I keep repeating,  
For the lovely girl is mine!  
She's rich, she's fair, beyond compare—  
Of noble mind, serene and kind;  
O how my heart is beating as her name I keep repeating,  
For the lovely girl is mine!

O how my heart is beating as her name I keep repeating,  
In a music soft and fine;  
O how my heart is beating as her name I keep repeating,  
For the dearest girl is mine!  
She owns no lands, has no white hands—  
Her lot is poor, her life obscure;  
Yet how my heart is beating as her name I keep repeating,  
For the dearest girl is mine!

#### CEMETERY OF PERA.

On this grave-yard, which covers the whole side of the hill, is the fashionable promenade of the fair Peraites: it is a place where *hainals* or porters resort to, to bask in the sun, whenever there is any—where droves of donkeys are passing guests—and where the dogs have established a permanent settlement. These dogs make their beds in the graves, and slumber in the shade of the turban-surmounted tombstones, which mark the last resting-places of the male among the true believers. Each one of these wild dogs has his grave, which is his peculiar property, and which he defends against the invasion of some canine compeer, anxious to increase his territories. Puppies are born in the graves, and there reared to mature doghood; and fierce combats take place, and many a wretched dog is torn to pieces by his savage associates; and from early dusk to the dawn of day, there is a howling and gnashing of tusks among the cypress groves of this last resting-place of the dead. You have some difficulty in making your way through the various groups of tombstones and trees, some falling and some fallen, which obstruct your path.—*Commonwealth (Glasgow paper).*

No. 32.

SATURDAY, AUGUST 12, 1854.

PRICE 1½d.

## THE EDUCATIONAL EXHIBITION AT ST MARTIN'S HALL.

THE Great Exhibition of 1851 seems destined to be the forerunner of numerous humanising enterprises, calculated to give all classes and all nations an insight into the better part of the character and doings of their neighbours. It set our Irish brethren busily to work, to establish an exhibition such as Ireland never saw before, and such as called forth a large measure of liberality and friendliness of sentiment. It urged our transatlantic fellow Saxons to try their hands at a Crystal Palace, and at a display of industry which English manufacturers do well to treat with respectful attention. It is impelling France to the formation of a majestic international Exhibition, in which Englishmen—now brought into a surprising state of good-humour with their former enemies—will take part in an industrial tournament in 1855. It has been the parent of that unequalled structure, the Crystal Palace at Sydenham, which has a future career before it whereof it would be difficult even to guess the extent or scope. It has led to the purchase of a large estate at Kensington Gore, which, albeit that governmental proceedings are terribly slow and ineffective, may one day be the home of art, science, and industry. It has led to such increased classes, lectures, and museums, at Marlborough House and the School of Practical Science, that men of science and working-men are brought together now as they seldom were before. It has led to special exhibitions at the Society of Arts, one each year, which have illustrated certain departments of knowledge in a very agreeable way. And now it has led to the organisation of an Educational Exhibition, such as is quite novel in this country.

The Educational Exhibition, now being holden at Mr Hullah's rooms, St Martin's Hall, in Long Acre, is highly interesting, and worthy of attention; since it is connected with a kind of centenary of art and education, and brings into one focus things and appliances which have never been brought together before. The Society of Arts is just one hundred years old; a venerable centenarian, that gets more vigorous as it gets older—its renewed vigour dating from the year when the Prince-Consort became president. Praise to the Prince, say we; praise, given without the smallest tendency to fawn or flatter. This, then, being the hundredth anniversary, the council bethought them how they might worthily commemorate the year 1854. They have done the eating and drinking part of the commemoration already, and we need say nought about that; but they resolved on something less evanescent than eating and drinking. In 1852, a plan was commenced

of receiving into union the literary and scientific institutions, philosophical societies, atheneums, and mechanics' institutes, established in various parts of the United Kingdom; and this with the object of assisting them, in any practicable way, in carrying out the great work of education which all of them have more or less in view. Down to the present time, more than 350 such societies and institutions have joined this union; and it would belie all past experience, if some good should not spring out of such co-operation. At a conference of representatives of these institutions, held in June 1853, it was resolved to invite the Council of the Society of Arts to establish an Educational Exhibition in 1854, as a worthy commemoration of the centenary. The council took up the matter in a right spirit; they applied to the foreign and colonial departments of the government, who assisted them in making the object known in foreign and colonial countries. In order to facilitate and encourage the exhibition of foreign appliances, the government permitted the admission at our ports, duty free, of all articles destined for the Educational Exhibition. At first, it was intended that the exhibition should be held at the rooms of the Society of Arts; but the number of contributors and contributed articles became so great, that St Martin's Hall was selected as the locality.

Such have been the 'antecedents' of the Educational Exhibition; and when we look at the bulky shilling-catalogue, it becomes evident that the number of exhibited articles must be very large. A visit to the place itself confirms this idea; for the great hall, and its galleries, staircases, passages, and approaches, are packed as closely as they can well be—irrespective of a long suite of rooms, somewhere up aloft near the sky, where the booksellers and map-sellers have matters all their own way. The articles are exhibited partly on walls, partly on counters and tables, and partly in cases; and as most of them are numbered with figures corresponding to those in the catalogue, their identification is tolerably easy.

Perhaps we shall best impart to our readers a general notion of this exhibition, if we say a few words first concerning the exhibitors, and then concerning the articles exhibited.

In the first place, then, the principal exhibitors are the societies and institutions which are engaged in fostering the great work of education. These are surprisingly numerous—comprising the National Society, the British and Foreign School Society, the Home and Colonial School Society, the Congregational Board of Education, the Wesleyan Education Committee, the Religious Tract Society, the Society for Promoting Christian Knowledge, the Irish Education Commis-

sioners, the Schoolmasters' Association, the Liverpool Collegiate Institution, the Government Department of Science and Arts, the Government Inspectors of Schools, the Royal Naval Schools at Greenwich, the Cheltenham Normal College, the Committee of Council on Education, the Norwich Training Institution, and numerous schools—Training, Infant, Parochial, Ragged, Proprietary, National, Industrial, Roman Catholic, and Jewish—in various parts of the country. Next come those excellent institutions which work earnestly to educate the poor unfortunates who have one or other of the inlets of knowledge closed: the Blind Schools in London (three in number) and in Yorkshire; the Deaf and Dumb Schools at Doncaster, Exeter, and Liverpool; and the Asylum for Idiots—all exhibit. Then come persons who have written books on education; persons who have invented apparatus useful in school-rooms; persons who manufacture and sell all the material appliances for education. Next come the publishers—the Longmans, the Whittakers, the Vartys, the Simpkinsees, the Parkers, the Dartons, the Maberleys, the Bagsters, the Blacks, the Blackies, the Blackwoods, the Chambersees, and others—all of whom become exhibitors, not in respect to their general publications, but in respect to such as bear directly upon the subject of education. Lastly—for we need not aim at any great minuteness—there are exhibitors whose display is of very great interest—comprising those from the United States, the British American colonies, Belgium, Denmark, France, Germany, Holland, Malta, Norway, Sweden, and Switzerland. Some of these foreign exhibitors are private individuals; but many of them are societies and government departments—such as the New York Board of Education, the Church Schools at Halifax, the Abendberg Asylum for Crétins, the Norwegian Governmental Department for Education, the Educational Council of Norway, the Council of Education at Thurgovie, and others. The number of articles exhibited, it is quite impossible to name with any pretension to accuracy; for, generally speaking, each number in the catalogue refers to the entire contributions from some one exhibitor.

One of the first facts which attracts the attention in this exhibition, is the great diversity of articles now supplied by the chief educational societies. Without touching upon any of the controversies between Churchmen and Dissenters, it is well known that these societies have approached by slow steps their present position. At a period not very far distant, many well-meaning persons—persons who had both the means and the wish to advance the position of the humbler classes—had quite a dread of anything beyond the merest rudiments of education for the children of working-men. The Bible, and a little reading, writing, and ciphering, were considered to be all that could safely be introduced into the machinery of popular education. But first one society, and then a second society, slightly extended their range; and then others did so likewise, that they might not be left behind in the race. Then, knowing that teachers and school-mistresses must have higher acquirements, if they are to impart a higher education, and knowing that the then existing masters and teachers had had to pick up their own education in a piecemeal and imperfect manner, the societies saw the necessity of establishing Normal Schools, to teach those who are in their turn to become teachers. And then, as there ought to be some means of judging of the relative fitness of the teachers, it was felt that a college of preceptors might be useful, to award certificates that would, to a greater or less extent, afford a guarantee for the qualifications of teachers. And lastly, the very machinery whereby

pupil-teachers are taught, supplies easy means for improving the school machinery for the humble every-day scholars. It is by some such steps as these that the National Society, the British and Foreign School Society, the Home and Colonial School Society, the Congregational Board of Education, the Irish Commissioners of Education, and similar bodies, have sanctioned and accumulated a stock of school machinery which has become quite formidable.

It matters little which we take as an exemplar of the societies generally; but let it be the National Society, whose schools are so well known all over England. Of the Society's school materials and books, there is a specimen of everything, we believe, at the Educational Exhibition; at anyrate, the exceptions are but few. First, we find 'Copy and Elementary Writing-books,' foolscap and post, ruled and plain, common and superfine, 12-leaved and 18-leaved, outline and graduated, which the Society supplies to schools at prices varying from 9d. to 4s. per dozen. Then come ruled books for manuscript music, of various sizes and shapes; then ciphering and memorandum books, still more varied in size and price. A full classification of paper—writing, blotting, letter, and note—is provided; together with all such writing-desk appliances as envelopes, sealing-wax, wafers, quill and steel pens, pen-holders, India-rubber, ink-bottles, ink-stands, &c. Slates and slate-pencils form a more interesting series than would generally be supposed; for besides the ordinary framed slates for writing, there are slates ruled with lines, slates with outline-maps scratched or engraved upon them, slates ruled for music, slates with engraved alphabets, large slates for diagrams, and slate-globes with a few geographical elements outlined upon them. Then there are globes, in box or on stand or pedestal, varying from 2s. to eight guineas each; school-clocks, silent or striking; black-boards for diagrams; desks, forms, and standards for them; easels and lesson-stands; abaci, or arithmetical frames; millboards, for lessons and prints; drawing and mathematical instruments, from the very cheap to the moderately dear; sponges, penknives, desk-knives, book-markers, school-bells, school-whistles, portfolios, pen-trays, half-board glasses, blotting-pads, and a number of useful trifles, which it would be no easy matter to enumerate. For teaching special branches of education, the apparatus is in some cases very complete. There are copies for writing, prepared in very varied forms. There are copies for drawing, still more varied, comprising trees, flowers, animals, buildings, landscapes, common objects, the human figure, &c.; and to aid in the use of these, there are all the usual kinds of drawing materials, such as drawing-paper, sketch-books, Bristol-board, pencils and crayons, crayon-holders, drawing-boxes, boxes of colours, squares, and parallel rulers; and so forth. There are chemical laboratories in portable cases; cabinets of shells, minerals, crystals, and common objects; folding drawing-models; solid models, susceptible of separation and re-adjustment, for illustrating geometry and many departments of science and art; diagrams of large size, illustrative of the mechanical powers, astronomical phenomena, natural philosophy, geological strata, and manufacturing processes; sheet-lessons of large size and of varied character. There are the numerous cards and tickets now used in the practical conduct of schools—such as admission-cards, suspension-tickets, confirmation-cards, admission-tickets, reward-tickets, late-tickets, punishment-tickets, 'clean-and-tidy' tickets, and many others well known to persons familiar with the working of popular schools. The little girls are not unprovided for, since their needle-work studies are aided by the supplies of needles, pins, sewing-cotton, thimbles, and scissors. In relation to prints, maps, and books, the Society's publications have become numerous: prints for infant schools and prints for more advanced schools;

maps in single sheets and maps in atlases; books for general reading and books for studying grammar, etymology, arithmetic, mechanics, mensuration, geography, history, needle-work, the principles of teaching, &c.

Now, so far as the Educational Exhibition is concerned, this display made by the National Society may be regarded as the Society's declaration of what they can do, what they propose to effect, and how they select material aids to facilitate their work. If another society be deficient in any of these aids, a careful and systematic examination will enable them to measure the extent of the deficiency, and to fill up the blanks so far as they may think proper. On the other hand, should this second society have adopted useful aids in which the former is wanting, a return benefit may result; and, as in morals and in magnetism, each may gain strength in giving. It is not, or ought not to be, a vain emulation. All the societies have, we believe, frankly and candidly put forth their real evidence—have really pictured what they are doing, and how they do it; and the juxtaposition of contributions from different quarters, renders comparison very easy. We may pass from the National Society to the British and Foreign School Society, and examine the latter's models of school-rooms, model-maps, objects for object-lessons, objects to illustrate manufactures, models of machinery, plaster casts for model-drawing, appliances for teaching writing and arithmetic, maps and globes, drawing-materials, diagrams, lesson-tablets, class-books, &c. And so of the Home and Colonial Society, the Sunday-school Union, and the rest. In so far as the government has become an educator, it employs material aids somewhat largely; and thus the Department of Science and Art has very properly sent to the Educational Exhibition specimens of nearly all the apparatus employed, comprising drawing-instruments, colour-boxes, strained canvas, copies for outline-drawing, drawings of machines, drawings of architecture—marine and engineering, diagrams and catechisms of colour, copies for shaded-drawing, copies for coloured-drawing, solid models and folding models, selected specimens of art-workmanship in pottery, plaster, and metal.

And as it is with the societies, so is it with individuals. If a schoolmaster, by his own clear sense, aided or not by a little pecuniary help, has devised something new or useful in educational apparatus, he is just the sort of person whose contributions to this Exhibition would be valued; and we consequently find numerous examples of this kind—examples of small contrivances which may be usefully adopted by others besides the contriver.

To those who are not especially connected with education in its ordinary routine, the apparatus for the blind is perhaps more interesting than the materials for general schools. The excellent society whose asylum is at Avenue Road, in the Regent's Park, for instance, have sent specimens of all the apparatus used by them in teaching the blind. Those who have studied this subject, are aware that an interesting controversy has been long carried on respecting the question—whether the raised letters for the blind ought to be in ordinary alphabetical characters, or in some kind of arbitrary short-hand. It would be out of place here for us to offer an opinion on this matter; and we will therefore simply say, that the society just named adopt an arbitrary character, composed of straight lines, curves, and dots. In this character they have printed numerous books. They have also embossed music, embossed chess-boards, embossed geometrical-boards, and embossed maps, for the blind. Mr Wood's embossed music is highly curious. The notes are represented by short strokes; the direction of the stroke represents the pitch of each note; the position of a dot represents the time or duration of a note; and thus—the pitch and the duration of each note being both shewn by one

character—the ordinary music-stave of five lines may be dispensed with, and the music is brought into one line, like common writing. The Blind Asylum in St George's Fields adopts the ordinary Roman alphabetical character; and it is pleasant to see, at the Educational Exhibition, a copy of the world-renowned *Robinson Crusoe* embossed in this type: the letters are beautifully distinct, and are so large, that Defoe's story occupies two quarto volumes; but then, as these volumes are sold so low as half-a-crown each, they are really cheap in respect to the object in view.

No part of the Exhibition is better worthy of study, than the contributions from foreign countries. Travellers and politicians, artists and moralists, place the men and women of foreign countries before our eyes; but here we have the boys and girls, in respect to the means whereby they are taught, and the practical results of the teaching. Why it is that a region so far north and out of the world as Scandinavia, should be better represented at this Exhibition than any other country, we cannot say; but such certainly seems to be the case, and Norway and Sweden are well worth attention at this reunion of nations.

It appears that, so far as regards these two countries—both under one monarch—the contributions come from the Government Department of Education, and from several managers of public and private schools. The contributions include, among other things, drawings of Swedish and Norwegian school-houses and school-rooms; ground-plans of school-buildings; programmes of schools, in respect to divisions into classes, subjects taught, weekly arrangements of lessons, and the number of pupils in each class; models and drawings of school apparatus; reports and records of various schools; models for teaching drawing, and specimens of drawings made by the school-children; the collection of apparatus used for teaching natural philosophy; selections from a zoological collection for teaching natural history; specimens of exercises, from various schools, in writing, Norwegian and Swedish composition, mathematics, German, English, French, and Latin; collection of class-books from various schools; collection of maps published at Stockholm and Christiania; and an instrument called the psalmodicon, for teaching music. Now, all this is excellent. It takes us at once into the boyhood and girlhood of those northern countries; it shews us what Young Scandinavia is about, and how it learns, and how it is taught. A detailed examination is in many parts curious, and worth the time it takes, even if it were merely to ascertain whether school-children fill up their books in Sweden as they do in England. We find that, where an English boy practises large hand in such long words as 'Transubstantiation,' 'Incommensurability,' and so forth, a Swedish boy has likewise his long words, which will frighten an English eye, as the following may perhaps shew: Rättfärdiggörelsen, Urskillningsgåfva, Yttranderättigheten—words, the equivalents of which in English we need not trouble ourselves to ferret out. Without professing to have a taste in needle-work, we may yet like to look at specimens of 'plain work' from the 'Trondjem Realskole,' especially the shirt wristband done in the 'Pigeskolens Begynderklasse,' or the beginning-class in the girls' school. There is an ingenious writing-frame for the blind in the Swedish Department, nearly like some of those used in England: there are two parallel rulers, the distance of which, asunder, is equal to the height of the letters to be made. These rulers have a little sliding-piece, which regulates the slope of the letters: the rulers rest on grooves in a frame; a tablet is placed within the frame, paper is placed upon the tablet, and thus the pupil writes in the oblong space between the two rulers, shifting the rulers from groove to groove as each line becomes finished. There is, in the machine, a sheet of paper, which purports to have been written

by some poor little Swedish blind boy or girl; and although the copy or sentence, that 'Europa år den mest bildede verdensdal,' simply corresponds with our own home-copies respecting the superior civilised condition of Europe, it is yet interesting as coming from the pen of a Swedish *areugle*.

In the Danish Department, there are a few written specimens which seem to recognise a sound principle. They are, apparently, examples of school-penmanship: each is headed at the top with the name of some distinguished Dane, such as Oersted, Schwanthaler, or Öhlenschläger; and underneath are a few verses commemorative of the hero. If the verses have any merit—if they rise above the level of mere rhyming—there is a spirit in all this which we like. There are not wanting English worthies who might be similarly placed before the eyes of English school-boys, provided always that the verses were in some degree worthy of the worthies—a point of no small difficulty.

It is just possible that those who have no opportunity of visiting this Educational Exhibition, may obtain a slight notion of its character from this brief sketch of ours. To those who can go, and who feel any pleasure in the advancement of education, we would say: Go by all means: you will obtain more than the money's worth for the trifle of money spent.

## THE HEIR-AT-LAW.

### CHAPTER II.

MARY SELWYN rose early on the following morning, and when I joined her at breakfast, she had, in appearance at least, quite recovered her usual cheerfulness and equanimity. She had determined, instead of writing, to go personally, and insist upon Clara's immediate return home. Another consternation awaited us: a note arrived from Mr Calvert, containing, beside the ordinary compliments, &c., a brief intimation that important affairs obliged him to leave that part of the country, and that some months would probably elapse before he could promise himself the pleasure of again calling at Beach Villa. 'Very extraordinary conduct this,' I exclaimed; 'upon my word, the man is a perfect riddle!'

'True,' was the low-voiced reply; 'and one which those who have duties to perform should not waste time in endeavouring to solve. Ah! here comes the fly Susan has ordered. Good-by, Gertrude, till the evening. We shall not be late home, I hope.'

It was, however, past ten o'clock before the fly returned, bringing the two Misses and Mrs Selwyn, the last still swelling and panting with the but partially abated storm of rage which Mary's determined insistence upon her sister's return with her to Beach Villa had thrown her into. Clara who, one could see, had been profusely weeping, retired to bed at once; but Mrs Selwyn, whose excitement precluded rest, or a wish for it, remained up to vent her indignation—first upon Mary, and when she had withdrawn, upon hapless me, who could not well refuse to listen. I gathered from the irate lady's objurgations, that there had been a violent scene at the Lumadens; that Mary Selwyn's firmness prevailed with difficulty, and not till Clara herself—upon being reminded, I had no doubt, of her father's dying injunctions, ever a potent spell with her—had decided for her prim half-sister against her own mother. It seemed, moreover, that two gentlemen had been dangling after Clara—Captain Toulmin, the young lady's favourite it was

intimated, and his friend, Mr Francis Herbert, the second son of the dowager Mrs Herbert, of Ashe Priory, the towers whereof were, on a bright clear day, dimly visible from the garret-windows of Beach Villa, whom Mrs Selwyn was evidently mad enough to hope might be hymeneally caught in the meshes of her own and her daughter's ambition. This struck me as so utterly preposterous, the Herberts ranking amongst the highest magnates of that division of the county, that I could hardly forbear laughing in the silly woman's face. Reflecting, however, that maternal vanity has ever been a chartered dreamer, I maintained, though with difficulty, a serious expression of face; and Mrs Selwyn, having at last exhausted for a time the phials of her wordy wrath, muttered a sort of good-night, and went to bed.

The next day but one, Beach Villa was let upon terms which had been several times previously refused; and within twenty-four hours of the completion of the bargain, the Selwyn family were on the road to Preston, near which a habitation more suitable to their means had been taken for them by Mr Thornley. Personal intercourse with my young friends was thus necessarily terminated; and that by letter, chiefly from the swift coming on of trouble in my own home, soon became infrequent, and before I left Lancashire, had entirely ceased. My father, a lieutenant in the royal navy, who had served with Nelson, was released at last by the welcome hand of death from sufferings he had bravely borne for several years: and in about two months only my mother sickened of the malady which was soon to reunite both parents in their long home. In the presence of these griefs, all minor regrets were of course rebuked and hushed; the Selwyns and their self-created difficulties were for the time forgotten; and I nerved myself to pursue with hope and courage the strange and solitary path of life before me, and over which thick darkness had so early fallen.

It was some time before I succeeded in obtaining the engagement with Mrs Ansted; and how that terminated, together with the sudden apparition of Clara Selwyn, bewilderingly transformed into Mrs Francis Herbert, of Ashe Priory, the reader has already been informed. The only tidings of the Selwyns which reached me after leaving Lancashire, was a hurried answer to a question addressed by me to Mr Thornley, whom I met at the Euston Station, just as the train in which he had taken his seat was about to start. I had inquired after Mary Selwyn, and his reply was to the effect, that she had long since thrown herself away upon a mean adventurer of the name of Calvert, and was, he understood, living in obscurity somewhere in Wales with her husband and one or two children. He had not time to add, that his information was solely derived, as I afterwards knew, from Mrs Selwyn, or I should have more correctly estimated the probable truth of the imputation upon Mr Calvert.

After this recapitulation of bygone events, it will not, I hope, appear surprising that I was bewildered by the unexpectedly announced and marvellous change in Clara's fortune, drawing after it a minor but still very appreciable improvement in my own. And, for the life of me, I could not at all realise that change. It seemed to be an impossible, dream-like extravagance—a *coup de théâtre*, only to be met with in a play or a novel, and I was half tempted to doubt, while proceeding the next morning in a cab to the Clarendon, whether I should really find the Selwyns in that aristocratic hotel. So far, however, there was

no illusion; Mrs Selwyn, who was looking exceedingly well, received me with prodigious condescension, and *Redburn'd* me over again and again with untiring self-complacency. With Clara, I was still 'dear Gertrude,' as in the old time; and her son, a nice little boy of about five years of age, had, I found, been tutored to address me as his mother did.

Precisely at twelve o'clock, we set out in a travelling-carriage, with four post-horses, for Ashe Priory—Mrs Selwyn being of opinion that journeying by rail was essentially vulgar and plebeian—and in due time were safely deposited at our destination. Arrived at that splendid abode, the feeling of unreality—a sense of the precarious tenure by which the lordly pile and its adjuncts *were*, I felt, be held by the present apparent mistress, returned upon my mind with aggravated force; and if I rightly read Clara's brightly flushing face, and nervous, unquiet looks, the same thought was beating at her heart, as, encompassed in each other's arms, we, with a shrinkingness, a timidity impossible to shake off, ventured through the stately and solitary apartments. 'Clara Selwyn'—thus ran my thoughts whilst making a hurried dinner-toilet—'Clara Selwyn the indisputable mistress of all this splendour—impossible! The same law-legendary which has installed her here in right of her son, will, I fear, by some counter-trick dissipate the glittering dream! In right of her son! Ay, that must be the substance which casts these ominous shadows! Clara's grandeur, at the best, can be commensurate only with the life of that frail boy; and not grandeur only, but bare competence; for now, when calling to mind the fragments of conversation between Clara and Mrs Selwyn during our journey, I remembered they talked of a legal opinion having been given that Clara's husband, Francis Herbert, having died before his elder brother, when he was consequently not possessed—seised, I recollect, the term was—of the property, she therefore, as his widow, was not entitled to her thirds of the personals. They spoke, too, of a sealed packet of papers found in the elder brother Edmund Herbert's escritoire, directed to an intimate friend of his, a colonial bishop, and of course duly forwarded, which, it is thought, may possibly contain a will disposing of the large personals, the landed property being strictly entailed on the heirs-male; and the alarming conclusion is, that the death of her son, the child heir-at-law, would at once hurl Clara from her present brilliant position into the abyss—by contrast made more terrible—of poverty and dependence! This boding train of thought pursued me as I sat at dinner—a *embarrassingly* comfortless one, by the by, except to Mrs Selwyn, who really seemed to feel that dining with a tall lackey posted behind her chair was her natural though shamefully delayed destiny; and I intently scanned the *physique* of the pale boy, whom his mamma insisted should dine with us, in fruitless quest of decisive indications pointing to a brief or a prolonged life.

These panic terrors had, to a great degree, subsided by noon on the morrow: the air was bright, clear, and invigorating to both mind and body: rest had restored the child's ruddy colour, and it was, after all, I reasoned in my improved mood of thought, likelier, or, at all events, quite as likely, that he would live to be the father of a family, as perish prematurely in his nonage. And the affair altogether, after a time, no longer struck me as being so monstrously absurd, so utterly incredible. The servitors, old as well as young, all acquiesced, undoubtedly, in the rule of the new dynasty; the numerous cards left by the notabilities for miles around were, to my silly thinking, so many attestations of the belief of those persons in the stability of the existing state of things; and I gradually ceased to torment myself by too curiously prying, or striving to do so, into the fateful and impervious future.

Clara, notwithstanding Mrs Selwyn's vehement

dissuasion, did not delay writing to her sister Mary—Mrs Calvert—urging her, in the kindest terms, to come and take up her abode with her two sons at Ashe Priory. Mary's answer—dated from the neighbourhood of Douglas, Isle of Man, where she had chiefly resided since her marriage—was a refusal of the invitation, at all events, for the present. She did not propose leaving home till the arrival of a gentleman, then abroad, to whom the settlement of her deceased husband's affairs had been intrusted. Clara, the letter stated, had been misinformed with respect to her, Mary's, pecuniary resources, which had always sufficed, not for the necessities only, but for the elegances of life, and would do so amply in the future. One brief phrase, alluding to the writer's bereavement, was conclusive with me, spite of Mr Thornley's second-hand story, afterwards very positively re-indorsed by Mrs Selwyn, that Mr Calvert had been in every respect worthy of the strong love which dictated it. More immediately addressing Clara in the old tone of affectionate warning, Mary adjured her with almost pathetic earnestness, not, spite of the present cloudless sunshine of good-fortune, to rest her future happiness and peace upon worldly elevation and grandeur. This was repeated again and again, in varying terms, but always with a fervency which shewed they were not mere cant words of course, but grave, and, in the writer's judgment, much-needed counsels. The menacing chance, then, that Clara's son might die during legal infancy, had painfully impressed her sister's mind as well as mine!—not prophetically, I could only hope and pray.

Although Mrs Calvert declined an asylum at Ashe Priory, another lady, the Hon. Mrs Toulmin, whom her son, Captain Toulmin, had by his reckless follies, it appeared, literally beggared, gladly accepted it, when pressed upon her with much delicacy and generous feeling by Clara. A remarkable compound of pride and kindness, buckram and benevolence, was that tall, pale, dignified, and very courteous personage. She could not but feel, and that acutely too, that Captain Toulmin, the next male heir to the domains of her ancestors, as well as of the Herberts, had been barred from the succession by the madcap marriage of his cousin, Francis Herbert, with a beautiful Nobody; yet did she soon come to love warmly the child of that marriage, who alone stood between her own son and a splendid heritage; and was as proud of the charming mistress of Ashe Priory as if Clara, instead of being a mere *parvenue*, could have boasted of a pedigree as long and unexceptionable as that of the last winner of the Derby. One curious trait in the good lady's character afforded us—that is, Clara and myself—much quiet amusement. Most persons, I have heard, derive pleasure, like honest Dogberry, from being able to boast of their losses; but this, I suppose, natural propensity, was, with the Hon. Mrs Toulmin, exaggerated to monomania. Over and over again, we used to watch her making elaborate and corrected estimates of the money-value of the family plate, jewels, furniture, books, horses, carriages—of every valuable, in brief, whereof she or her son—the same thing—had been despoiled by the law of succession, her self-importance evidently increasing, *pro rata*, with the vastness of the sums thus laboriously ascertained; and when, as sometimes happened, a property was spoken of in her presence—a farm, for instance—of which she had not before heard, she would eagerly inquire its gross value, note it instantly with a pencil upon her ivory tablet, adding it to the previous total, and then mentally glorify herself upon the additional wealth she was thus proved to have lost! In sooth, my own opinion is, that all the Herberts were more or less of eccentric intellect. In the dowager Mrs Herbert before spoken of, the erratic mental predisposition manifested itself in a pride of lineage—of which I could give many ludicrous anecdotes—approaching to insanity in its fantastical

extravagance; in Francis Herbert, on the contrary, it displayed itself in contemptuous disregard of the marital code governing his order; and in the Hon. Mrs Toulmin, not only as just related, but in other modes which it is needless further to allude to. Before this narrative is concluded, the reader will perhaps discover additional proof of the soundness of my theory.

The presence of the Hon. Mrs Toulmin at Ashe Priory naturally drew after it that of Captain Toulmin; and it did not fail to occur to me, that Clara might have had some notion of the kind when she pressed the invitation upon that lady. However that might have been, September was no sooner at hand, than Captain Toulmin rented a sporting-box in the neighbourhood, and thenceforth was a daily guest at the Priory. A gay, handsome, specious man of the world, of about, I should say, five-and-thirty, was Captain Toulmin; a gentleman of polished address withal, and completely master of the little arts of society, which, being constantly in requisition, are so effective in making a company reputation, and concealing essential defects of education and character. Fully determined, too, was he to render himself exceedingly agreeable to Mrs Francis Herbert, and to marry her, if her little boy's health should not—as it had already evinced some indecisive symptoms of doing—fatally decline. There was another frequent guest at the Priory, the Rev. Charles Atherley, rector of the parish, though only eight-and-twenty, possessor of a handsome income, and a very different man from Captain Toulmin; the fate of his timid matrimonial aspirations also depended, I could not help believing, upon that of Clara's son. 'Poor boy!' I silently soliloquised one afternoon, as, partially hidden by a sun-screen, I watched the demeanour of the two gentlemen, who had been affecting to read, as an excuse for non-intercourse, both being implacably jealous of each other—'Poor boy! you little know with what intensity of interest they are contemplating the sudden pallor that has overspread your pretty face—the languid listlessness with which you have just laid aside your play-toys, and stretched yourself upon that couch. You did not see, and seeing, would not have comprehended, the exultant flash, as lurid as fire from the bottomless pit, which broke from the dark eyes of the captain; no more than you would the rector's involuntary glance—not of grief—quickly followed by the pang of self-reproach, which has sent him hurriedly across the room to you with those oranges and jujubes, and causes him to speak with such gentle tenderness, that you look up lovingly in his face, and take his hand as if it were your mamma's or mine.' The good rector has since then often declared that my surmise wronged him; but I am not for that the less convinced that I was right. The truth was, he was over head and ears in love with Clara, and could not shut out from his mind, try as he might, an instinctive conviction, that were Mrs Herbert no longer the lady of Ashe Priory, and mother of the heir to the Herbert estates, Captain Toulmin would at once cease to be his rival; and moreover, that possibly the rectory, and something approaching to two thousand a year, might not, in that case, be thought beneath her acceptance.

All this, I say, was as plain to me, a looker-on at the play of cross and selfish purposes in progress—lookers-on proverbially knowing more of the game than the actual players—as if the Rev. Charles Atherley, A.M., and Captain Toulmin, had told me so in as many words; but Clara's inclinations I could not so positively determine. I saw that the handsome *roué* was her shadow, whether she remained at home, or walked, or rode out, and that she was flattered, pleased with his obsequious courtesies; but this was all; and she invariably, moreover, laughed off every attempt I made to treat the matter seriously. Then Mrs Selwyn was indefatigable in his praises, which I could very well

understand and excuse; forasmuch that Captain Toulmin, being the next heir to the entailed estates after little Francis, a marriage with him would insure Clara's future, and of course her own, in any eventuality. The Hon. Mrs Toulmin also greatly favoured her son's apparent intentions; and after much cogitation, and considerably influenced by the recollection of what I heard Mr Calvert say of Captain Toulmin, I determined upon writing to Mary, and informing her of my conjectures, doubts, and fears; not forgetting to add an injunction to keep my name out of any controversy that might arise upon the subject. My letter was quickly responded to, and in person: Mary Selwyn—Mrs Calvert, I should say—making her appearance at the Priory as soon as a letter by return of post would have reached me. Surprised, delighted, I need hardly say Clara and I were to see her; and looking so wonderfully well, too, spite of the tint of recent sorrow which shaded and softened the fine glow of health, and a certain matronly, yet youthful grace and air which seemed, so to speak, to radiate from her. I had no idea she would ever have been so handsome, and the same thought was, I saw, sparkling in her sister's eyes. Mrs Selwyn's greeting was of the coldest, grimmest; and her discontent was greatly increased the following day when Mary directly questioned her sister concerning Captain Toulmin; and upon receiving what she deemed, unsatisfactory replies, peremptorily insisted, as if Clara was still a child, and she her absolute guardian, that the intimacy should be forthwith and unmistakably broken off. This brusque mode of proceeding was certainly not in accordance with the dictates of Mary's usual calm good sense. Clara, as might have been anticipated, accustomed as she had of late been to the most obsequious deference, would not tolerate such rude schooling, even from her sister; and Mrs Selwyn fired up with ungovernable fury. Mary soon recovered her rarely lost command of temper, listened for some time with unruffled composure to the dual storm she had rashly evoked, and at last said in her quietest manner, in reply to a rude taunt of Mrs Selwyn's relative to her own comparatively beggarly match with that Calvert, and rising as she spoke to leave the room—'I do not reply to you as you deserve, because my father's wife and Clara's mother will always be at least passively respected by me, even when, as now, she grossly fails in respect to herself. Come with me, Gertrude: I wish to speak with you.'

We passed out of the house, and for some time walked silently about the lawn and shrubberies, Mary, as I could feel by the trembling of her arm, for I did not like to speak or peer into her face, being very much agitated—I supposed in consequence of Mrs Selwyn's coarse and unfeeling allusion to her husband. After awhile, her emotion passed away, and she had commenced questioning me of her sister's intimacy with Captain Toulmin, when that gentleman came galloping up the avenue, gallantly waving his hand as he neared the house towards the window of the apartments where we had left Clara and her mother. Mary's countenance flushed scarlet, and she said quickly: 'Go, Gertrude—go at once and inform Captain Toulmin—privately will be best—that I must speak to him immediately in the library; you, of course, returning with him. This audacious insolence shall be endured no longer.'

I was a good deal startled by the energy of manner she displayed, as well as by her words, but nevertheless hastened promptly to perform her bidding. I awaited the captain's return from the stables in the hall, delivered my message *sotto voce*, at which he seemed a good deal surprised, but of course bowed graceful acquiescence, and followed me to the library. Mary was standing at one of the windows, and as the door opened, turned and confronted the nonchalant man of fashion with a commanding sternness of aspect that

not only confused and astounded me, but appeared to disconcert greatly the gallant captain himself.

'Mary—that is, Mrs Calvert,' I stammered—'Clara's, I mean Mrs Herbert's, sister—Captain Toulmin.'

Captain Toulmin bowed fiercely, and ejaculated 'Ha!'

'I have sent for you, Captain Toulmin,' said Mary with an air befitting an empress, 'to request that you will immediately discontinue the offensive attentions which this lady, Miss Redburn, informs me'—

'Good heavens, Mary!' I burst out, interrupting her; and there I stopped, literally for want of words or breath—perhaps both. Talk of spontaneous combustion—I was red-hot from head to foot in an instant!

'That you will immediately,' resumed Mary with inexorable persistence, 'discontinue the offensive attentions which this lady, Miss Redburn, informs me you have presumed to obtrude upon my sister, Mrs Herbert.'

The man's frame seemed to dilate with passion, and his fierce eyes glared at Mrs Calvert as might those of a wild animal at bay, and about to spring upon the hunter. For a moment only could he confront her steady gaze, and he presently blurted out: 'Why—who—what is all this?'

'The request I have made,' continued Mary, 'is, in fact, a command which Captain Toulmin will not dare to disobey; and for this reason, that I happen to know where his wife, his cruelly abandoned wife, Lydia Barton before marriage, is now residing.'

A dreadful imprecation, with which I will not stain the paper, burst from the detected culprit's lips; but he was thoroughly cowed, as well as all but maddened; whilst Mary, in her calm nobleness of contempt, looked positively beautiful—Juno-like.

'Upon condition, Captain Toulmin, that you at once cease those insulting attentions—that your visits here are very brief, not oftener than once in each week—and that your department is that of a person whose presence is barely tolerated from respect to your mother, Mrs Toulmin, which is the exact truth—I will not, for the present at least, disclose your disgraceful secret to my sister; my only motive for this forbearance being, that were I to do so, Mrs Toulmin would be, there can be no doubt, immediately deprived of the only home her son's vices have left her. Now, Gertrude, let us be gone,' she added, after a slight pause, the captain's convulsing rage not permitting him articulate speech. 'This gentleman, I have no doubt, perfectly comprehends his position, and the line of conduct it behoves him to pursue.'

We then quitted the library, I in a perfect maze of wonder and excitement, not untinged with passing anger. 'Let us return to the shrubbery,' said Mary; 'we can converse more freely there. You are surprised, and a little vexed, dear Gertrude,' she went on to say as we left the house, 'that I should have mentioned you in connection with this unpleasant affair; but you will forgive me, I am sure, after hearing the reasons which induced me to do so. In the first place, it could do you no possible harm.'

'I am not quite sure of that. Captain Toulmin has numerous and influential friends; and should it happen that'—

'Listen, love,' interrupted Mary, 'till I have finished, and then object as much as you please. It is necessary, for several reasons, that appearances should, for the present, be saved with regard to Captain Toulmin; and, above all, that Clara's name shall not in any way be mixed up with that of a married man in the greedy, indiscriminating public ear. I have now a slight hold of him through his mother, which, were Clara supposed to be in my confidence, would of course be at an end. I fear, besides, that his showy exterior and plausible manners may have in some degree captivated my sister's fancy; and nothing is more certain to dissipate

that preference, if it exists, than the substitution, on his part, of an apparently causeless rudeness and neglect for the honeyed courtesies with which he has of late assailed her; because, thereby wounding her vanity—dear Clara's weak point, as you and I may confess to each other. Poor child!' added Mary, in a low, musing tone, 'she shall not, if I can help it, have her fall from the giddy state which so delights her, imbibed by the violent disruption of even an imaginary contract of affection.'

'You believe, then, that the life of little Francis is tainted mortally?'

Mary looked sharply in my face, hers at the same time faintly colouring, and said: 'To be sure—yes; and that is also your opinion, is it not?'

I confessed it was, and Mary proceeded with her reasons. 'I heartily wish Clara had never been placed in her present position. She arrived here a fortnight, as it chanced to fall out, before I had even heard of the dreadful accident—the sudden death, I mean, of—the elder brother, Edmund Herbert.'—

'You are trembling like a leaf, Mary, in this sharp wind: let us return to the house.'

'No, no; I have a few more words to say. Do you know,' she resumed quite briskly, 'that I very much like the Rev. Charles Atherley, who spent last evening with us—chiefly, I daresay, that he is so evidently devoted to Clara. That, now, is a connection which I would do all a sister might to foster and promote. Engaged to so worthy, so agreeable a person, a handsome independence assured to her, the fall of the present house of cards would not be felt so keenly by her, as otherwise I fear it will be.'

'You are not unworldly, Mary,' I said, with an involuntary smile, 'at least for others.'

'Nay, nay, Gertrude; do not say that. The chances are, you know, that a will has been made, and that Clara will have a fair share of the Herbert personal property; so that, expectations included, there is no such great disparity of fortune between her and the rector. And now, Gertrude,' concluded Mary, 'that we perfectly understand each other, let us in, and for the future endeavour, by every means within our reach, to promote dear Clara's permanent happiness and welfare.'

#### THE SERIOUS MASK OF THOMAS HOOD.

Hood's popularity as a comic writer has tended to obscure his reputation as a poet, which might otherwise have been higher than that of many of his contemporaries whose poetry has received a more liberal recognition. The reading public knows him mainly as a quaint satirist, or a merry jester, and seems to be unaware, or to have forgotten, that he is the author of some of the most impressive and beautiful poems in the language. His earlier performances, perhaps, were not much calculated to attract the general attention; being for the most part deficient in human interest, and built up too exclusively of imagery and trains of sentiment remote from ordinary feeling and conception. The *Plea of the Midsummer Fairies*, published in 1827, though a refined and graceful poem, and containing many exquisite descriptions, must, upon the whole, be pronounced a somewhat tedious and unintelligible production. For one thing, the fairies are now incapable of exciting modern sympathies; and therefore a long poem on their imaginary proceedings can seem little else, in serious times, than a mere frivolity or impertinence. There are abundant beauties in this little allegory, fine and original images, elegant, scholarly allusions—all prettily wrought in; and yet one cannot help perceiving that all this exquisite blossoming of a

gifted intellect is next to purposeless; that whatever aim it may profess to have, it serves no moral or æsthetic object, contains the seed of no abiding principle or feeling, and is, in short, nothing but an ingenious elaboration of images and poetical conceits.

In *Hero and Leander*, we have a more attractive theme; in Hood's management of which, however, there is much to be objected to. One cannot see the need of that mythological agency which he has introduced as a means of accounting for Leander's death. It is assuredly a more natural and human incident, and therefore a more poetical one, for a man to be drowned in an ordinary way through lack of strength in swimming, than to be intercepted and dragged down into the deep by a mermaid who had fallen in love with his fine face; and this for the simple reason, that nobody can in these days believe in the existence of the mermaid; and even if we are to consider her as a personification of the dangerous qualities of the ocean, she only serves to represent, in a circuitous manner, what would be sufficiently intelligible and more affecting if presented to us in a more natural and direct description. Nevertheless, this poem displays the presence of a rich poetic genius, and images and expressions might be taken from it worthy to live for ever. As one small specimen of its musical and masterly versification, we will quote a stanza that seems to us absolutely perfect. The sea-nymph having carried down Leander to the bottom of the waters, and unconsciously drowned him in the process, fancies him to be asleep, and endeavours to awaken him by many solicitous endearments. Among the pleasant things she says to him is this:—

Now lay thine ear against this golden sand,  
And thou shalt hear the music of the sea,  
Those hollow tunes it plays against the land—  
Is't not a rich and wondrous melody?  
I have lain hours, and fancied, in its tone,  
I heard the languages of ages gone!

In the same strain of sustained melody and picturesque expression, most of the poem is composed; and were it the object of a poem simply to pile up and connect a number of beautiful images and descriptions, there would be little or nothing to find fault with in Hood's performance. But we conceive the subject, from its intrinsic nature, required a totally different management. It is a story of passion, danger, and bereavement: it therefore demanded a form of representation in which all those violent elements should be passionately exhibited. Instead of this, Hood has turned the story into a pretty and fantastic allegory, and made its interest and attraction to depend on the fanciful ornaments with which he has adorned it in the telling. The defect of the poem, accordingly, lies not in any defect of poetical expression and illustration, but in what may be styled an organic misconception of the poetical attributes of the subject. The author, indeed, professes to have traced the story from 'the course of an old bas-relief,' and thus to have only written down in words what had been previously pictured to the poetic vision; but this cannot be offered in answer to our objection, inasmuch as the objection will apply equally to the sculptured as to the poetical representation. As it is, the poem, though abounding in fine fancies, is commonly found to be tedious in the reading; and hardly any one is likely to recur to it, unless it be a few leisurely persons who are so peculiarly organised as to find a pleasure in minute analogies, or elaborate imagery without a purpose.

In *Lycus, the Centaur*, Hood has attempted a different style, and seems to us to have succeeded considerably better than in the two preceding poems. It is open to one of the objections before mentioned—that is to say,

the existence of a centaur is as unbelievable as that of a mermaid or a fairy; but, granting the centaur possible, a discriminating reader will not fail to perceive, that the poet has in a manner entered into the very nature of the creature, and reproduced all the qualities and sensations which it is supposable that a human being so transformed would be likely to possess. Lycus is thoroughly human in all respects, except his shape. The story being a classic one, Hood has properly enough aspired to give it a classic form. In this particular, we hold him to have been upon the whole successful: the piece reads like a fine translation of some Homeric fragment, save that it is less direct and simple, and more profuse of imagery than is the wont with Homer. The argument runs to this effect: Lycus being allured and detained by Circe within her magical dominions, comes, after a time, to be beloved by a water-nymph, who, desiring never again to part with him, sought to render him immortal, and for that purpose had recourse to the great sorceress. Circe, agreeably to her vindictive and deceitful nature, gives her an incantation to pronounce, by which Lycus would be turned into a horse; but, owing to the horrible effect of the charm upon the patient, she suddenly breaks off in the midst, and Lycus becomes a centaur. This, at first sight, does not seem a very poetical subject; but Hood's genius has thrown a life and beauty into it which are exceedingly striking and attractive. Lycus is made to tell his own story; and the narrative has a tone of profound pensiveness, which seems suitable to his condition—that of a conscious intellectual being imprisoned in the body of a brute. It is touching to follow him through the relation of his sorrows, heightened as they are by the remembrance of intense delights which he had for a short while experienced in the region of enchantment. In the depths of his degradation, the form of the fair water-nymph still haunts him, and would seem to be still beloved, notwithstanding the miseries that had befallen him through yielding to her passion. In his memory, she remains an imperishable fascination. Hood has also made her, as it were, alive with the glorious breath of his poetry. Let the reader note the mild splendour of this exquisite description:—

Thus far

I had read of my sorrow, and lay in the hush  
Of deep meditation; when, lo! a light crush  
Of the reeds, and I turned and looked round in the night  
Of new sunshine, and saw, as I sipped of the light  
Narrow-waking, the realised nymph of the stream,  
Rising up from the wave with the bend and the gleam  
Of a fountain; and o'er her white arms she kept throwing  
Bright torrents of hair, that went flowing and flowing  
In falls to her feet, and the blue waters rolled  
Down her limbs like a garment, in many a fold,  
Sun-spangled, gold-broidered, and fled far behind,  
Like an infinite train. So she came and reclined  
In the reeds, and I hungered to see her unseal  
The buds of her eyes, that would ope and reveal  
The blue that was in them.

O my heart, it still dances  
When I think of the charm of her changeable glance;  
And my image, how small when it sank in the deep  
Of her eyes where her soul was—alas! now they weep  
And none knoweth where. In what stream do her eyes  
Shed invisible tears? Who beholds where her sight  
Flow in eddies, or sees the ascent of the leaf  
She has plucked with her tresses? Who listens her grief  
Like a far fall of waters, or hears where her feet  
Grow emphatic among the loose pebbles, and beat  
Them together?

After his transformation, Lycus escapes from the enchanted precincts, and wanders lonely about the world, shunning the abodes of men, yet from a distance looking down upon them with an inextinguishable interest and yearning. A profound longing at length seizes him to visit his native land; but he forbears, out

of regard to considerations which are thus beautifully expressed:

Thus I wandered, companioned of grief, and forlorn,  
Till I wished for the land where my being was born;  
But what was that land with its love, where my home  
Was self-shut against me; for why should I come  
Like an after-distress to my gray-bearded father,  
With a blight to the last of his sight?—let him rather  
Lament for me dead, and shed tears in the urn  
Where I was not, and still in fond memory turn  
To his son even such as he left him. Oh! how  
Could I walk with the youth once my fellows, but now  
Like gods to my humbled estate?—or how bear  
The steeds once the pride of my eyes and the care  
Of my hands? Then I turned me, self-banished, and came  
Into Thessaly here, where I met with the same  
As myself.

The sense of outcast desolateness, the burden of immovable regret, and the stoical resignation which are here blended and wrought together with such mild mastery and proportion, evince a poetic genius little short of the very highest, and which, if employed upon subjects of popular and universal interest, might have produced works of as high a reputation as any that have appeared in modern times.

Hood's only remaining poem of any considerable length, is the *Golden Legend of Miss Kilmansegg and her Precious Leg*—a satirical performance of the most extravagant whimsicality, in ridicule of the folly of mammon-worship. Nothing can exceed the richness of grotesque invention, the riotous play of fancy, or the felicitous turns of witty and humorous expression, which are the distinguishing features of this wondrous production. It is, perhaps, the most characteristic of all the author's writings; inasmuch as all his comic peculiarities—all the excellences and all the faults of his individual style—are crowded and fused together in a sort of premeditated and deliberate amalgamation, as though he had determined to shew what, in the way of eccentricity, his genius could produce. It abounds with all conceivable conceits—with every variety of fun, and farce, and drollery,—with caricature, parody, puns, sly insinuations, and the most quaint and ludicrous allusions and similitudes—making altogether perhaps the most singular medley of humour, wit, and fanciful exaggeration that is to be found in the English language. But, running throughout, there is a distinct and serious moral purpose, which all this profusion of levity is designed to illustrate. We cannot say that, in an artistic point of view, it needed so profuse an illustration; yet the facetiousness and brilliancy of what is actually superfluous not only inclines one to tolerate it, but even to delight in it for its own intrinsic pleasantry. Within our present limits, we have no space to give any outline of the story, which, it must be confessed, is in some respects absurd; but, as a necessary introduction to the following extract, we may mention that the heroine, Miss Kilmansegg, having by an accident lost a leg, and, through her passion for affluent display, supplied its place by a member of solid gold, she is in due time sought in wedlock by a dashing foreign count, to whom, after an appropriate courtship, she is married. The count turns out to be a scamp of the first magnitude, and after squandering the lady's riches to a large extent, by gambling and other extravagances, begins at last to entertain sinister designs upon the golden limb. This much being stated, we presume the quotation will be intelligible.

Now the Precious Leg while cash was flush,  
Or the count's acceptance worth a rush,  
Had never excited dissension;  
But no sooner the stocks began to fall,  
Than, without any ossification at all,  
The limb became what people call  
A perfect bone of contention.

For altered days brought altered ways,  
And instead of the complimentary phrase,  
So current before her bridal,  
The countess heard in language low,  
That her Precious Leg was precious slow,  
A good un to look at, but bad to go,  
And kept quite a sum lying idle.

That instead of playing musical airs,  
Like Colin's foot in going up stairs—  
As the wife in the Scottish ballad declares—  
It made an infernal stamping;  
Whereas a member of cork, or wood,  
Would be lighter and cheaper, and quite as good,  
Without the unbearable thumping.

But spite of hint, and threat, and scoff,  
The Leg kept its situation;  
For legs are not to be taken off  
By a verbal amputation.

Persisting in her whim, and scornfully opposing the mercenary insinuations of the count, conjugal squalls and storms arise; and at last one day, in a passion, the countess destroys her will, thereby intimating her intention of cutting off her faithless partner from the future possession of her fortune. He, however, endures the business mildly, inwardly resolving to be at least

The Golden Leg's sole legatee,  
And that very night to administer!

So he kills the countess with her Golden Leg, and therewith departs somewhere into the 'subterraneous realms of Rascaldom,' and the reader hears of him no more.

In the verses just quoted, the reader will not fail to observe, that, though unquestionably witty, there is nothing in them which can be properly called poetry; there are, however, occasional passages in the poem where the strain rises into the real poetical element, and has a momentary sound of something like solemnity. The runaway ride in the Park and Piccadilly, whereby the lady is in danger of her life, and loses at least a limb, is strikingly and imaginatively described—the description being filled with all the terrifying images, all the sights and sounds, and fears that would naturally crowd upon a person in so perilous a situation; and we notice a soft and melancholy reflectiveness in such lines as the following, which form a sort of prelude to the catastrophe by which, at length, the hapless heroine is hurried out of existence:—

'Tis a stern and startling thing to think  
How often mortality stands on the brink  
Of its grave without any misgiving:  
And yet in this slippery world of strife,  
In the stir of human bustle so rife,  
There are daily sounds to tell us that Life  
Is dying, and Death is living!

Ay, Beauty the Girl, and Love the Boy,  
Bright as they are with hope and joy,  
How their souls would sudden instanter,  
To remember that one of those wedding-bells  
Which ring so merrily through the dells,  
Is the same that knells  
Our last farewells,  
Only broken into a canter!

But breath and blood set doom at nought—  
How little the wretched countess thought,  
When at night she unloosed her sandal,  
That the Fates had woven her burial-cloth,  
And that Death, in the shape of a death's-head moth,  
Was fluttering round her candle!

From Hood's comparatively long poems, we turn

now to his smaller pieces, wherein, as we conceive, he has attained his highest and most memorable success. These are of several varieties of style, the best of which belong to what is termed the homely tragic narrative, and a peculiar form of the lyric, in which lightness and pathos are intermingled. Of the former sort is his *Dream of Eugene Aram*, wherein, we think, he has fully realised the only poetical conception of which Aram's story is susceptible. Hood depicts him as telling the tale of his own crime, under the similitude of a dream, to an innocent school-boy in a nook of the cricket-ground of the school at Lynn, where he was an usher at the time of his arrestment. It is a thrilling and ghastly tale, rendered all the more effective by the contrast of peaceful images presented in the scene wherein it is described to be related. Never was the poetry of *misery* more admirably conceived, nor more naturally and powerfully represented. The reader is made to sympathise with the sorrow, the remorse, and fears of a man who had committed a great crime; but the sympathy extends only to his wretchedness, and never for a moment to the deed of which he had been guilty. Herein, as we conceive, Hood has accomplished a feat of poetic art which has very rarely been equalled, and wrought a moral effect into his poem which, considering the subject-matter, could not have been achieved except through the operation of a pure and refined genius.

Of our poet's grave and pathetic lyrics we may mention, as among the most excellent and striking, his well-known *Song of the Shirt*, and another which is entitled *The Bridge of Sighs*. The former is notable, perhaps, more for its immense popularity, gained through its publication in the pages of *Punch*, than for any great artistic beauty or brilliancy of execution which it can be strictly said to possess. As an appeal in behalf of the distressed needlewomen of London, it would appear to have produced a great impression on the public mind, and undoubtedly stimulated, if it did not altogether originate, the social enterprises designed subsequently for their relief. It has been remarked, that not the least striking and impressive quality of this song, is its half-jesting tone, its lightness and jocular presentment of the tragic elements which form the burden of its purpose. With an adroit and delicate hand, the poet has cast into the plaintive wailing of the forlorn seamstress here and there a quaint conceit; thereby wonderfully enhancing the touching and melancholy impression of the strain. Let us quote, in the way of illustration, the two following stanzas:—

Work—work—work  
Till the brain begins to swim;  
Work—work—work  
Till the eyes are heavy and dim!  
Seam, and gusset, and band—  
Band, and gusset, and seam,  
Till over the buttons I fall asleep,  
And sew them on in a dream!  
  
O men, with sisters dear!  
O men, with mothers and wives!  
It is not linen you're wearing out,  
But human creatures' lives!  
Stitch—stitch—stitch,  
In poverty, hunger, and dirt;  
Sewing at once, with a double thread,  
A shroud as well as a shirt!

From the specimens now given of Hood's serious poetry, we suppose the reader hitherto unacquainted with it will obtain a tolerably fair impression of its leading characteristics. It will be seen that a subtle and fertile fancy, the liveliest wit, a delicate perception of minute and remote analogies, and an exquisite command of language, are the most prominent of his intellectual qualities; while, as regards his moral peculiarities, it will be noticed that, with a constant tendency to light-

ness and levity of manner, he always, more or less, inclines to sound the depths of that unfathomable solemnity, and even awfulness, on which the hopes and fears of mortals are for ever tossed or resting, as on a sea whose shores and limits are unknown. Life is immensely serious to him; but in the dimness and uncertainty towards which so many of its adventures tend, he would exhort his fellow-voyagers on the grand abyss to take heart and cheer themselves, to laugh and genially while away the time, and even to temper their inevitable despondency by quaint and fantastical diversions. Often, under his grotesque masking, there is an earnestness too profound for tears, and which fails not to impress us the more intensely because of the disguise in which we find it. Strictly speaking, we cannot call Hood a *great* poet; but that he is a true, pure, and very admirable one, there can be no hesitation in declaring; and we would here commend his poems to the more general attention of English readers, who, as far as we can perceive, have not yet given them any very extensive consideration. It is nine years since they were first collected in two small volumes; and at the present writing, they would appear not to have passed through a first edition. This we must esteem a circumstance very much to be regretted, and rather indicative of something of that popular indifference to genuine poetry which has been sacrificed to the present age; though when we call to mind the numerous editions which some of our patriot versifiers can point to in proof of a popular appreciation, we could almost hope that poor Hood has somehow been simply overlooked; and that the readers of poetry are not sufficiently aware of the beauty, truthfulness, and wisdom which, in unpretending forms, he has left behind him for their delight.

#### CAPE HORN.

If any intelligent school-boy were asked to name the three most geographically remarkable capes in the world, he would probably answer, after a moment's consideration—Cape Horn, Cape of Good Hope, and North Cape of Lapland. He would be quite right. The trio mentioned are undoubtedly the foremost of landmarks, and the richest in historical and romantic associations. It is usual to speak of them as the respective continental terminations of America, Africa, and Europe, but this is only literally correct as regards the Cape of Good Hope. A glance at a map of the globe will shew that some degree of resemblance exists in the positions of Cape Horn and the North Cape. To describe the former, is the object of this paper; but we may here speak briefly of the latter, on the score of geographical contrast. An arm of the sea, called Magerø Sund, or Sound, flows between the mainland of Finmark—the real termination of the continent of Europe in a northern direction—and the island of Mager—which we may roughly estimate at a score of miles in length, and a dozen in its greatest breadth—the northern headland of Mager forming the North Cape;\* and another remarkable projection to the eastward is known as *The Horn* (so named from its shape), and is a noted landmark for ships sailing to and from the White Sea. During the greater portion of the year there is little daylight in this high latitude: during upwards of two months in winter, the sun never rises; and during a corresponding period in summer, it never sets. The reader may imagine the aspect of the Cape in its season of storms and darkness.

The mighty continent of America gradually tapers southward, until it ends with the desolate country of Patagonia—fitting home for a race of gigantic savages!

\* See 'Visit to the North Cape,' in *Chambers's Edinburgh Journal*. No. 382, Second Series.

The Straits of Magellan—so named after the daring Spanish captain who was the first to penetrate through them into the unknown Pacific Ocean—separate the extremity of Patagonia from the large and singularly shaped island of Tierra del Fuego, which very evidently was torn by some mighty convulsion of nature from the mainland long ages ago. Ships sometimes, but rarely, prefer risking a passage through the Magellan Straits to weathering Cape Horn. Staten Land is an island separated from Tierra del Fuego on the eastward by the Straits of Le Maire. Numerous small, sterile, rocky islands are grouped to the southward of Tierra del Fuego, and are known by various appellations; but the most southern and desolate cluster are very appropriately named *The Hermits*;\* and of these Hermits, the one furthest of all to the south terminates in the celebrated Cape Horn. Beyond Cape Horn are yet other islands, but they are much too remote to be spoken of in connection with the continent of South America and its contiguous isles. Cape Horn itself is in latitude 56 degrees south. Who first discovered it, is not positively known; but it certainly received its present designation from the Dutch navigator Van Schouten, who reached it in the *Unity*, in January 1616.

Individually, our earliest ideas of Cape Horn were derived from the voyages of Dampier—who, by the way, influenced many succeeding navigators by the success of his resolute attempt to double the dreaded Cape. The *Wager*, one of Anson's squadron, was wrecked on Tierra del Fuego, and her crew underwent a long series of unparalleled sufferings, which are vividly detailed in the narrative of Admiral Byron (grandfather to the poet), who was a midshipman in the *Wager*, and was one of the very few survivors who reached England again, after five years spent in dismal wandering and adventure subsequent to the wreck. What Anson himself experienced off Cape Horn may be gathered from the words of the writer of the voyage, who says: 'We had a continual succession of such tempestuous weather, as surprised the oldest and most experienced mariners on board, and obliged them to confess that what they had hitherto called storms, were inconsiderable gales compared with the violence of these winds, which raised such short, and, at the same time, such mountainous waves, as greatly surpassed in danger all seas known in any other part of the globe.' Captain Cook was thirty-four days tempest-tossed off the Cape on his first voyage, although on his second he met with more calms than storms on the same spot. No marvel that we are impressed with an appalling notion of the dangers of doubling Cape Horn from the perusal of such narratives. The ill-fated *Bounty*, for instance, on her outward voyage, encountered tremendous weather off the Horn, and after fighting against the elements for thirty days, Lieutenant Bligh gave up the attempt to double it in despair, and ordering the helm a-weather, to the extreme joy of his worn-out crew, bore away for the Cape of Good Hope to refit.

Down to a comparatively recent period, seamen, influenced both by tradition and personal experience, almost universally regarded Cape Horn as a spot of the most evil omen, and associated the idea of doubling it with every imaginable danger and unimaginable suffering. Nor were these terrors, ascribed to the vicinity of the Cape, altogether fanciful, but rather the reverse, as we shall presently shew. It must, however, be borne in mind, that the ships which doubled, or attempted to double, the Horn, down to even fifty years ago, were very poorly fitted to contend with such tremendous elemental warfare as frequently prevails at the junction

of the Atlantic and Pacific. Only those who are conversant with nautical matters, can conceive the prodigious improvement which has taken place during the present generation in the build and outfit of ships destined for long voyages; and, we may add, that seamanship, both theoretical and practical, so far as any rate as the officers are concerned, has improved in a commensurate degree. Compare for a moment the ships sailed by Captain Cook, or Bligh's miserable little ship the *Bounty*, with the magnificent Australian liners of the present day! What astonishing progress is manifest! Let us also remember, that until the commencement of the nineteenth century, very few ships of any description were sent into the Pacific. At rare intervals, discovery-ships penetrated round the Horn, and a few South Sea whalers were beginning to follow, but the majority of the vessels which doubled the Cape were Spanish and Americans, bound to Chili, Peru, and California. Until even a dozen, or at most a score of years ago, nearly all ships which proceeded to Australia from England, returned by the same route as they went (that is, by Good Hope), but now they all, except the mail-steamer, circumnavigate the globe by boldly doubling Cape Horn. For one English ship that doubled the Horn in the time of Captain Cook, five hundred or a thousand now do so—and their captains never think of publishing even a sixpenny pamphlet to narrate the feat for the admiration of posterity. A quarto volume would hardly have sufficed in Cook's time! Fifty years ago, it was a rare thing to meet with a sailor who could boast that he had sailed round the globe; but now you have only to step down to the dock-side in any large seaport, and you will find that probably one-half, if not two-thirds, of all the grown-up, long-voyage seamen you question, have doubled Cape Horn—some of them, it may be, a score of times. Let not the reader, however, entertain the idea that these men have actually seen the Cape. On the contrary, we do not believe that one ship in a hundred that doubles it ever approaches sufficiently near to distinctly sight the redoubtable Cape; for so little do seamen love it, they always stand well off to the southward in rounding. Staten Land is much more frequently seen by passing ships; but the men who actually know most of Cape Horn and its vicinity, are the daring North American sealers, who have long pursued their hazardous calling thereabouts. And should the long-projected Darien Canal ever unite the Atlantic and the Pacific—thereby saving ships bound to the South Sea Isles, or to California and Peru, the immense labour of going round South America—the number of vessels doubling the Horn will materially decrease.

And now for a more particular description of the Horn itself. In 1820, his majesty's ship *Conway*, commanded by Captain Basil Hall, had occasion to double it, and approached unusually near. One night, they saw a bright red light, which appeared to them only eight or ten miles distant; but in the morning 'we found,' says Captain Hall, 'by means of bearings taken with the compass, that it actually was upwards of a hundred miles from the ship, on the mainland of Tierra del Fuego. It is not improbable that this or a similar volcano may have led Magellan to give the title of "Land of Fire" to this desolate region. By six o'clock in the morning of 26th November, we had approached within ten or twelve miles of Cape Horn, and in sailing round to enter the Pacific, had an opportunity of seeing it on a variety of bearings. Under every aspect, it presents a bold and majestic appearance, worthy of the limit to such a continent. It is a high, precipitous, black rock, conspicuously raised above the neighbouring land, utterly destitute of vegetation, and extending far into the sea in bleak and solitary grandeur.' Thus far Basil Hall, and we cannot do better than to subjoin to his brief sketch a more animated picture of Cape Horn

\* We believe, however, that this group is not so named on account of its solitude, but from Jacques l'Hermite, who commanded a Dutch squadron that visited, or discovered, the islands in 1623.

by Fenimore Cooper, in one of his latest and most remarkable books, *The Sea Lions*.—‘The land was broken, high, and of a most sterile aspect.... a sort of pyramid, which, occupying a small island, stood isolated, in a measure, and some distance in advance of other and equally ragged ranges of mountains.’ He describes Cape Horn as an irregular peak of considerable height, and says: ‘The earth probably does not contain a more remarkable sentinel than this pyramid. .... There it stood, actually the Ultima Thule of this vast continent, or, what was much the same, so closely united to it as to seem a part of our moiety of the globe, looking out on the broad expanse of waters. The eye saw to the right the Pacific; in front, was the Southern or Antarctic Ocean; and on the left, the Great Atlantic. Turning north, they beheld the high lands of Tierra del Fuego, of which many of the highest peaks were covered with snow. The pyramid on which they were, however, was no longer white with congealed rain, but stood, stern and imposing, in its native brown.’ We may add, that the aspect of Cape Horn has frequently been compared to that of a recumbent lion—an out-sentinel of Nature, guarding the termination of the American continent. The resemblance to a couching lion is said to be surprising from some points of view.

At Cape Horn, the month of February may be considered midsummer; and the worst and stormiest month of the year is said to be July, when the sun rises at 8-30 A.M., and sets at 3-30 P.M. Even in the finest weather, the air in the vicinity is usually dark and menacing; and the waves fall on the rocks with a deafening hollow boom, now and then varied by a thundering prolonged roar, as though a thousand hungry lions were roaring in concert; and the spray dashes high up in the air, which it fills with vapoury mist, so that the grim old Horn is usually enshrouded with a ghost-like veil. The jagged rocks split up the waters, so as to form countless currents and miniature whirlpools; and the tides, also, have a very heavy rise. Albatrosses, Cape-pigeons, stormy-petrels, gulls, and other wild sea-birds fly around, adding their discordant, startling screams to the incessant din of the elements. In the sky, directly overhead, may be seen at night the Magellan clouds, three in number—one dark, and two white. Yet more interesting is the Southern Cross—four lustrous stars of great magnitude, which form an extremely luminous and striking constellation in the shape of a cross; as celebrated in the southern hemisphere, as the North Star and Great Bear are in the northern portion of the globe. The junction of the two mightiest oceans at all times produces a swell of the sea off the Cape, surpassing any similar phenomenon elsewhere; and by the peculiar feel of that swell alone, the experienced mariner can tell if he is on the point of entering the Pacific. Waves are here sometimes seen more than a quarter of a mile between trough and trough. The heaviest seas of all generally tumble in from the south-west. Such, as we have thus briefly sketched, is the aspect of the Cape and the adjoining ocean at even favourable seasons; but try to imagine what the spectacle must be in stormy weather, when the days of winter are short and dense, and the nights long and dark—the snow and hail pelting mercilessly—the cold intense—the salt-water freezing as it falls on deck—the shrouds and rigging coated with ice—the sails as stiff as sheet-iron—the billows mountainous—icebergs rolling in all directions—and the ship, perchance, deep-laden and weak-handed! This is no fancy picture, but a frequent reality. Sailors may well call it ‘man-killing’ work under such circumstances, even if they manage to carry through everything into the lower latitudes of the Pacific or the Atlantic, as the case may be. As an instance of what even a powerful, well-manned ship may have to encounter, the American frigate *Brandywine*, some years ago, was exactly two months battling with

the elements off the Cape, and lost many brave men during that protracted struggle. Not a year passes without several ships foundering off Cape Horn, and very few indeed weather it without a sharp taste of its proverbial quality. It is true, that sometimes a ship, by keeping well to the southward, and being favoured with a fair and powerful wind, will rapidly and easily pass from one ocean to the other; but such a case is decidedly exceptional. A large and stout steamer would undoubtedly be able to double the Cape at any time, and in any weather, much sooner than the swiftest and finest sailing-vessel, as steam would enable her to make headway in the teeth of a gale; but even the mightiest steamer would at times be almost or altogether baffled.

Beyond all comparison, the most vivid and interesting account of doubling Cape Horn ever published, is that by Dana, in his *Two Years Before the Mast*. We never have forgotten the extremely vivid impression that narrative made on us on its first perusal: it clenched all our former notions on the subject. The reader knows what is before him when Dana tells how they patched and quilted their jackets, trousers, &c., for a ‘Cape Horn rig,’ consisting of ‘thick boots; south-westerns, coming over our necks and ears; thick trousers and jackets; and some with oilcloth suits over all. Mittens, too, we wore on deck.’ How affecting and suggestive, too, is this passage, after the worst of their long struggle was over, and Staten Land was not far distant: ‘A bright gleam of sunshine broke out, and shone down the companion-way, and through the sky-light, lighting up everything below, and sending a warm glow through the heart of every one. It was a sight we had not seen for weeks—an omen, a God-send! Even the roughest and hardest face acknowledged its influence.’ Dana did not see Cape Horn, but we may appropriately conclude this paper by quoting his description of what he saw of Staten Land:—‘The land was the island of Staten Land, just to the eastward of Cape Horn; and a more desolate spot I never wish to set eyes upon—bare, broken, and girt with rock and ice; with here and there, between the rocks and broken hillocks, a little stunted vegetation of shrubs. It was a place well suited to stand at the junction of two oceans, beyond the reach of human cultivation, and encounter the blast and snows of a perpetual winter. Yet, dismal as it was, it was a pleasant sight to us, not only as being the first land we had seen, but because it told us we had passed the Cape, and were in the Atlantic; and that, with twenty-four hours of this breeze, we might bid defiance to the Southern Ocean.’

#### THE WHORTING-PARTY.

‘A HOLIDAY! a holiday!’ exclaimed Everard Dumont, bursting into the school-room where his sisters and his little brother were busily preparing their lessons and exercises for the next day. ‘Away with your books, girls! down with that slate, Phil! papa has proclaimed a holiday for to-morrow, in honour of Jacie’s birthday; and there is no need of preparation when no work is to be done. So away with it all, and come and settle our plans with me, and Bob, and Otto’—and ending this uproarious harangue with an equally uproarious ‘hurrah!’ Everard threw his cap to the roof, and then standing for a moment on his head, with his legs quivering in the air, he suddenly ‘righted,’ and bounded out of the room, calling again on the others to come into the garden. But the young gentleman was speedily recalled by the united voices of the children and their governess, who, unseen by him, had been seated in a deep window-seat; and not a little was he abashed when he found that his ecstasy had been witnessed by her. ‘Oh, I beg your pardon, Miss Colville,’ said he, returning; ‘I really did not see you, or I should not have made such a row in

your presence. But do, *please*, let the girls come; we want them so much to help to settle about to-morrow.'

Miss Colville, the kind friend of the children, either suspecting that little would be done whilst their young minds were affloat on other subjects, or else feeling that a few additional hours of summer joy would do more good than harm, gave a smiling dismissal to the three fair girls and the curly-pated Phil, whose eyes all waited on her glance; and soon were the brothers and sisters assembled in gay consultation on the shaded bank in the paddock.

'And what is to be done, Evvie?' said Rachel, a sprightly girl of thirteen. 'I hope we are to go somewhere.'

'Somewhere! I should think so,' exclaimed Robert, their eldest brother, who came up at the moment; 'but where—what is it to be? Now guess, girls; guess, Phil; and 'Guess,' was echoed by all who were in the secret.

'I guess a sail on the river,' said one; 'And I guess a picnic to Halswell and Enmore,' shouted another; and a third exclaimed: 'And I think it will be to go to Burnham, and dine on the sands, and pick up shells.'

'All wrong—all wrong!' screamed the boys in delight. 'Now I tell you,' added Robert: 'it is a picnic, and it is not—at least not a *true* picnic—for we are to take all the grub, or get it there. It is to be a grand whorting-party in the Quantocks. You know Jacinth will be nineteen to-morrow, and it is papa and mamma's wedding-day too; so papa is going to give this party—only, instead of having it in the house, it is to be in the beautiful valley among the hills, where Mrs Maine lives; and now, which of us are to go? Guess!' and again the guessing, of which children are so fond, went from lip to lip. The elder ones seemed pretty secure that they would have part in the projected party; but the younger branches of the family looked sobered and doubtful, for, of course, in so large a family, it was not usual for more than a few to be included in such arrangements.

'Well, Phil, you for one do not expect to go, I should think?' said Otto, a good-humoured lad of sixteen, but who rather delighted in teasing the young ones. 'As you happen to be seventh, you will allow that you have not much chance?'

'Come, come, Otto,' said Robert, seeing poor Phil beginning to fight with some most unmanly tears, which appeared disposed to overflow: 'we will not allow any nonsense. Cheer up, my boy; I have some of the best of the whole to tell: we are *all* to go—all—every one—and you have to thank Jacie for it! Papa said it was *her* day, and he would give her her choice, either to ask the Seymours and Celthorpes, and some more gay people, and take only two or three of us elder ones; or to turn out all the contents of the school-room and nursery, and have every one, down to Nance and "baby-boy," and Jacie chose the latter. Now, I ask you all, wasn't it good-natured of her?'

'Oh, it was just like her!' echoed from one to another of the children. 'She is always trying what she can do to give us pleasure.'

'If I had heard papa ask her, I'd have wagered anything,' said little Phil, whose eyes now beamed with delight, 'that she would have said just what she did. Well, now, go on, Bob, and tell us all about it.'

'Well, then, the short and the long of the matter is, that papa and mamma say they cannot manage for more than twenty-two, besides the necessary servants; and we are all to get there the best way we can—some on the ponies, and some in the cab way, and those who can do no better, in the great wagon that is to carry the servants and the provisions; that is to set out an hour or two before the rest, because it will go slower. But we are all to start early, to be in time to pick whorts for the pies and puddings before it gets too hot. Whort-picking is to be the grand object of the day; but those who prefer it are to fish; and mamma and Alicia mean

to sketch; and Jacinth is going to botanise; and the *babes* can swim little boats in the brooks, and grub about for flowers, and make any fun they like; and a capital day it will be, I suspect.'

And now we will leave our young ones to consult about what fishing-tackle, and baskets, and other gear they should take, and to fill up the hours which must intervene between the present moment and the prospective pleasure in the best way they can, only asking those of our readers who have reached the summit of the hill of life to look back a little, and recollect whether they have not sometimes found, in earlier days, that the gush of pleasure which the prospect of such a time of simple enjoyment as that which lay before our young friends induces, is not a very precious thing? and whether the hours of anticipation which precede such a period, are not in themselves often more full of life's gayest hopes and enjoyment, even than those hours they forestall?

We will ourselves fill up the interval by inquiring a little into the nature of the fruit which it was the object of our merry party to 'victimise.' The very pretty little shrub which bears the berries—called in different localities by the names of whorts, whortle-berries, hurts, hurtleberries, bilberries, and blaberries—grows about a foot, or from that to two feet in height, and very bushy and thick, like a little myrtle. Its leaves are small, and something like the myrtle in form, but serrated at the edge; of a delicate green when young, but becoming more dark and hard towards autumn. This shrub bears very abundant flowers, each placed separately; in form bell-shaped, like some sorts of heath, waxy, and of a delicate greenish white, richly tinted with pink. These pretty blossoms appear in May, when a branch of the plant is a lovely addition to a nosegay. In July, the berries they produce are ripe, and almost as pretty as the blossom which precedes them. They are about the size of currants; but of course, as the blossoms stand separate, so do the berries, and not in strings or branches; so that each berry must be severally gathered; but as there are a great many on each branch, this is not so long a process as might be imagined. There is no relic of calyx remaining on the fruit, as that organ is what is termed 'superior,' and the swollen receptacle which grows below it is the edible part; neither do the remains of petals so cleave to the berry as in the currant; its form is globular, like a tiny plum, only that there is a little cup-like depression on the top, and it is covered with an elegant blue bloom, like an untouched grape. Its colour is a deep purplish black. This plant is of the natural order *Ericaceæ*, and its proper name *Vaccinium myrtillus*.

The geographical range of the whortleberry is extended through the north of Europe, Africa, and Asia. It is found also in North America, and grows at a very high degree of north latitude. In Iceland, it is abundant; and at Nootka Sound, and in Nova Scotia, it may be found, but nowhere is it more plentiful than in some parts of our own land; and yet, although so freely produced in some counties, that all the world seems to eat nothing but whorts in the season, there are other counties where such a berry has never been found, and the inhabitants—poor things!—have not the least idea of what is meant by a whort-pie.

This little lowly shrub is one of God's gifts to the poor of the land. It does not grow in pasture-fields or cultivated and enclosed lands. It defies the gardener's skill, and the agriculturist's cupidity. Where the heath and hill are wild and uncultured, free to man and beast, there does it spring up in its simple beauty and its rich profusion, and there may all who are willing gather of its abundant produce, none saying 'Nay.' In Somersetshire, Devonshire, and other counties where it abounds, it is eagerly collected by the poor women and children of the district, and sold at about

4d. a quart. Nor is a market ever wanting; for so delicious are the berries, that poor and rich alike delight in them, either made into pies and puddings, or stewed with currants, and eaten cold with rich cream and bread, or boiled rice. It is a juicy, cool, rich fruit, and considered especially wholesome; though it certainly has one fault—that of leaving a deep purplish stain on the lips and teeth of those who eat it; and you may pick out from your row of scholars or teachers at the Sunday-school those who have partaken of whorts, in some form or other, by the deep tinge with which their mouths are dyed. This evil may, however, be in a great degree obviated, and the flavour of the fruit greatly improved, by the addition of about one-third of red or white currants, their acidity tending to counteract the effect. In the Black Forest, there is a variety of *Vaccinium myrtillus* that bears white berries. Many kinds of game eat the whortleberries, and, indeed, chiefly live on them in the autumn.

But to return to our holiday-party. The wagon set forth at six on the brightest of July mornings. It contained Nance, and her assistant Hester; Phil, who kept his resolution to 'take time by the forelock;' Emily, Kate, Blanche, and baby Basil, a roundabout pet of some two years old, not the least vociferous of the party. Moreover, there were two or three extra servants. It would not be easy to tell what the wagon contained beside the living freight. Hampers full of chickens, and cold meat, and veal-pies; great cakes and fruit-tarts for those who had not taste enough to like the provincial dainties that were to be prepared on the spot; and abundant supplies of pale ale and pleasant British wines, besides all the paraphernalia of plates, knives and forks, &c., usual on such occasions, were among its contents. A highly approved part of the plan was, that the young ones were to breakfast in the wagon; to facilitate which, a large basket of ready-cut bread and butter was packed; and they were to call at a farm some two miles on their way, and there obtain supplies of new milk, fresh and warm from the cow, and so jog on, eating and drinking as they went. The rest of the party breakfasted at home, and set forward on their way in joyous spirits, their guests being to meet them at the end of the little journey.

The scenery of the spot on which they had agreed to meet—O how lovely was it! but too rich in verdant straths, densely wooded combs—as low hills rising from a valley, and clothed with trees, are called in the south-west of England—gushing streams, and lovely herbage, to be described with mere pen and ink. Then the stretch of heathy hills, all flecked with coppices and thickets, with sunny banks whereon not only 'the wild thyme blows,' but others where the fragrant wood-strawberries might be found in abundance; and between these banks and thickets, broad spaces, covered with purple heath and golden gorse, all alive with bees and butterflies; and the pure full blue of the cloudless vault of heaven hanging over all the radiant sunlit landscape in unbroken splendour. It was a glorious day and a glorious scene, to which all the fair and gay young beings who now stood gathered round the door of a rustic farm, which lay in one extremity of the valley, consulting over their separate plans of amusement, added a new and most attractive feature. They were a merry group, and we must introduce them individually to the reader. Jacinth Damon, the queen of the day, must take the lead. No doubt, having heard of the young lady's good-nature in giving up the power of inviting gay young friends, for the purpose of making room for a whole host of little brothers and sisters and their nurses, our readers will have depicted her in their imaginations as a fair soft blonde, with a mild countenance, and probably a little what boys would call 'muffish.' We are sorry to disappoint them, if such is their idea of her; but our Jacinth—or, as she

was usually called, *Jacie*—was no such thing. She was as merry and sparkling a brunette as Rosalind, and almost as saucy—full of life and frolic, and liking nothing better than a scamper on the hills or a dance on the green-ward. Alicia, her next in age, a plain but intelligent girl, with abundant good-humour. With Robert, Otto, Rachel, and Everard, we have already made acquaintance; and these, with the five younger ones who had come in the wagon, went far to make up half the number of allotted guests. Then there were Mr and Mrs Damon, and Aunt Margaret, who was Mrs Damon's sister, and Miss Colville, the girls' nice governess, making up the number fifteen, so that seven visitors only were of the party. There had been some consultation as to who these should be; some had been elected by acclamation; but there had been long balancing before it could be decided which of several regular 'eligibles' should be included, and which, by consequence, excluded. Annie Cleveland, Jacinth's inseparable friend, was of course called for *sem. con.*, and this involved Salome, her sister, who could not be left at home. Then Phil besought for Billie to go too, Billie being his inseparable, so the three Clevelands were fixed on; then some one suggested Hugh Scott and Alice—'they must go.' 'Well, be it so,' said Mr Damon; 'and we will then ask Mr and Mrs Scott; they will be companions for mamma and me, and that will make up our number.' And now just intimating that Mr Scott was a lively, agreeable barrister, and his wife the delight of all young people, from her cheerful sociability and great capabilities of amusing; that Hugh was a young Cantab, of some distinction in the schools; and Alice a fine gentle, almost child of sixteen—we will leave the party to speak for themselves.

All being assembled in and round the porch of the farmhouse, a lively discussion was going on respecting their several projects for passing the morning. Mrs Damon and Alicia, together with Salome Cleveland, were soon seated in a sheltered nook amongst some trees, a little way down the combe, surrounded with palls and moist colours, and all the other belongings of water-colour drawing; and each so much absorbed in transferring the likeness of some stately group of trees, or picturesque gable-end of a cottage, to her paper, that no sound save the ripple of the brook, or other such sweet reminders of country seclusion, was to be heard in their neighbourhood. The little ones had gambled away with Hester and their baskets, too eager to await the settling of preliminaries, and the rest stood still deliberating. It was so far decided that one party should go with the young ones to the whortleberry-thickets to gather fruit; and the rest were, with rod and line, to follow the brook, and strip it of its finny inhabitants, bringing home—as they hoped—enough of fish to dine all the farmhouse family and the servants, besides their own fifteen selves and friends. But there was a hitch somewhere as to who would be of either party. Hugh Scott could not make up his mind. He was an undoubted adept in the art of angling, and known to be especially fond of it; but, strange to say, on this occasion he declared eventually that 'he did not care a straw for fishing; give him 'the fine open hillside, and the merriment of the little ones!—he should go whorting.'

A latent smile flickered on the eyes of some of the party at this sudden fit of love for children, for it was quite a new feature in his character. There certainly was lurking mischief in the minds of some of the party; and we are sorry to say that a comical movement of the lip, and a saucy light in the eye, gave indications that Miss Jacie had a share in it. Alas! that we should have to confess it; but truth compels us to say that a spice of coquetry, or something that, under less wise guidance than that of her excellent parents, might have become such, might be found in Jacinth's character; and dearly did she delight in shewing her power. On

the present occasion, it had been generally understood that she was to join the hillside detachment; she had said nothing, but the others had reckoned on her for the whorting-party, and named her as one of them; and it was guessed that Hugh's enthusiasm for children arose from his desire for sister's company.

Both parties were to proceed together as far as the entrance of a copse which lay in their road to the meadows; here the fruit-seekers were to branch off, and here they all paused for a few moments.

'I go with you, papa,' said Jacinth. 'I shall not disturb your fishing; but you know I want to look for the "skull-cap," and some other plants that grow by the brook: come, Annie;' and away sprang the two girls, without casting a glance at the other party.

'O Jacie, don't go; we cannot do without you,' shouted the younger ones; but it was all in vain: Jacie and Annie were already out of hearing. Poor Hugh! his dilemma was serious; however, after for some time striving to join in the laughter and mirth which surrounded him, he found that he could no longer endure 'letting I dare not wait upon I would'—and suddenly remembering (lucky fellow!) that he had some part of his father's fishing apparatus in his pocket, he shot off down the hillside in the direction of the brook, and as the old allegories say, 'we saw him no more!'

And now, as we proceeded onwards, the copse became an exceedingly animated scene. We should, however, scarcely call it a copse; it was rather a succession of thickets and bits of underwood, scattered over little knolls and banks, with fine strips of soft hillside turf between; and it might well be questioned which were the gayest and most lovely—the multitudes of birds and gorgeous butterflies and dragonflies skimming about in the air, or the brilliant and joyous children, and young girls and boys, who sprang about among the flowers on the earth, shouting with joy as they discovered grove after grove of the pretty whort-shrubs laden with their blooming fruit.

Soon were the baskets filled to the brim with the sweet berries; and despatching some of the motley crew to the farm with them, and strict injunctions to Mrs Maine, the farmer's wife—who, before her elevation to that rank, had been for many years their cook—to be sure to make plenty of pies and puddings, 'enough for dinner and supper too,' our young ones seated themselves in groups to enjoy the hour as they listed. Here was a party of what Robert called 'babes,' gathering wood-strawberries, and threading the scarlet gems like beads on long spikes of grass, some of them every now and then springing up to chase some glittering insect which passed speedily by, or to make an excursion to a neighbouring bank, where some floral treasure was thought to lurk; there was a group gathered round Mrs Scott, who was delighting some of the elder ones by reading to them some scenes from *The Midsummer Night's Dream*; whilst a third party were stretching themselves on a 'flowery lay,' in earnest talk, enjoying those outpourings of mutual confidence so essential to the joy of youthful hearts, and planning, with perhaps a full allowance of sentiment and romance, schemes for their future lives—dream-like anticipations, full of bright lights and vivid expectations.

The hour proposed for dinner now drew near; and Nance, gathering her charge together, drove them before her like a flock of young frolicsome lambs to the home-pastures, frisking and gamboling, and upsetting themselves and each other in their mirth, as untired as if they had not all been up from five in the morning. The elders followed, as gay at heart, though a little more restrained in manner; and near the farm they fell in with the fishing-party, who, having consigned the contents of their baskets to the hands of Mrs Maine, were comparing notes, and greatly exultant in the full success of their piscatorial efforts.

Jacinth, and Annie too, had been successful in their

pursuit. 'It was lucky that I had my father's reel in my pocket, Miss Damon,' said Hugh. 'You would scarcely have been able to get at that asphodel without my help, for the bog was rather of the wettest.'

'Well, my good fellow,' observed his father, 'I am glad you found something to do in that way; for really I do not see any other particular good you did us. Why, Hugh, you boast of being a good fisherman: I do not think you caught a fish to-day.'

Hugh blushed, and the same odd smile glanced from eye to eye. We wonder why; for what can be more orthodox, than that a gentleman should not allow ladies to ransack bogs for flowers without assistance? Why should a young man blush or stammer when his politeness is remarked on? O consciousness! what tricks dost thou play us!

The party was large; but Farmer Maine's fine old hall was by no means put out of countenance: it had space for them all; and at the table where the harvest-home and sheep-shearing feasts were wont to be held, the whole party, little and big, with the exception of the two youngest, who were scarcely old enough to 'behave themselves before folk,' were soon arranged. Mrs Maine had added some of her finest ducks and chickens, and a grand piece of bacon, to the otherwise cold feast—a move exceedingly approved of by the boys, for 'ducks and green pease' are well known to be the treat, *par excellence*, of young creatures of the school-boy genus. The trout were superlative, and the whort-pies only beaten by the whort-puddings, inasmuch as the former ought to have been cold, and were, of necessity under the circumstances, hot; whereas the latter were as they ought to be—smoking hot, and swimming in the dark, rich sirup of the juicy fruit. Great bowls of cream flanked these dainty dishes; and truly an alderman of the olden time might have felt himself well off at that ample feast. The party were as merry as the viands were good. Hugh was himself again: he had apparently solved the problem which had occupied his mind in the morning; he now neither blushed nor stammered, but stood the fire of all the saucy young creatures; and turning out Phil, who had established himself by the side of his favourite Jacie, coolly possessed himself of the place, and gave himself up to enjoyment; no repulse being looked or spoken by the young lady, who, however, seemed to have herself appropriated the blushing and stammering propensities which had been abandoned by her neighbour. We ourselves suspected, that being unable to solve the problem himself, Hugh had asked Jacie to resolve it for him when they were chatting alone under the weeping-ash whilst the dinner was serving, and that she was abashed at its having been thought possible that she understood that branch of mathematics. But of this we cannot speak with certainty. It is quite clear that, after dinner, when Jacie was particularly wanted, she was nowhere to be found; and Rachel was obliged to take her place, and enact Titania to Robert's Bottom the Weaver, in her stead. All the young ones who had heard Mrs Scott read in the morning, had determined 'this green plot shall be our stage, and this hawthorn brake our tiring-house, and we will do it in action.' Bob, therefore, with a brown felt-hat drawn over his brows, and two tufts of bulrush-tops stuck in it, to represent asses' ears, lay lounging on a bank with his pretty little sisters hovering over him, and promising—

I'll give the fairies to attend on thee;  
And they shall fetch thee jewels from the deep,  
And sing while thou on pressed flowers dost sleep.

Then the four little ones, all decked with flowers, were made to act fairies, and directed to

Hop in his walks, and gambol in his eyes;  
Feed him with apricocks and dewberries,  
With purple grapes, green figs, and mulberries;

and bravely did the extempore performance go off,

till 'baby-boy,' not quite comprehending the menial nature of the character he was enacting as Pea-blossom, puled off the fictitious ass's head, and began so vigorously to pull poor Bob's hair, as to make Titania's 'gentle joy' quite outrageous; on which a grand romping ensued, and the scene ended with shouts of laughter. Many merry games followed among the younger ones, and again the elders revelled in groups among the trees, each party disporting themselves as best suited the freak of the moment. Another visit to the whort-grounds was projected, and performed, and quarts of berries gathered and stowed away in the wagon for home-consumption—wood-strawberries, too, were to be gathered for tea. Some of the party enjoyed a visit to the cool large dairy, where stood the broad shining brass vessels full of scalded milk, coated with the rich clotted cream of the county, and of great bowls of the same rich commodity already skimmed off, and set by for use; and others amused themselves in learning to milk—an art in which Salome Cleveland and Alicia Damon made such progress, that they boasted of having drawn all the milk that was used for tea; whilst Annie, who for once found herself irretrievably separated from her inseparable, amused herself, in conjunction with Miss Colville, by making the junket, and skimming the cream for the whole party. Still Jacinth and Mr Hugh Scott were invisible, nor was it till quite tea-time that they reappeared to give account of themselves.

We would fain tell our readers what plants they had found in their excursion, which was no doubt of botanical tendency; but a bit of forget-me-not, in Jacie's hand, on which she seemed to set great store, was all we saw. We should like also to enlarge much more on the many pleasant enjoyments which filled up the rest of this long day in the country; but our space will not allow us to say more, than that the same plan was adopted for the children's tea as for their breakfast, and they, with full supplies of cake, bread, and butter, and new milk, were despatched in the wagon at an early hour, and were all so sound asleep by the time they reached home, as to be obliged to be lifted out, and put straight to bed. The elders, after enjoying a happy 'Three-make' under the trees behind the farm, set forward just as the deepening shadows of the woods and the brightening rays of the moon began to warn them that the night was coming on; all agreeing, that of all possible ways of enjoying a holiday, there was none to be compared to that of spending it amidst the beautiful valleys and combs of the Quantock Hills in the whorting-season.

#### SULPHUR.

This mineral product is the key which opens the door to chemical manufactures. From it we make sulphuric acid (oil of vitriol), and without sulphuric acid many of the largest factories would cease to exist. By its aid we are enabled to produce so many substances, that the bare mention of them would fill the whole paper. Bleaching, dyeing, soda-making, metal-refining, electro-plating, electric-telegraphing, &c., are primarily indebted to this acid. Many of the most valued medicines could not be made without it—such as ether, calomel, &c. Sulphur being the chief ingredient of gunpowder, modern warfare could not go on comfortably without it. A people that does not possess lucifer-matches, stands beyond the pale of civilisation; yet matches cannot be made without sulphur—not because matches are dipped into melted brimstone before they are 'tipped' with the phosphoric composition which ignites them, but because this very material could not be made without the indirect use of sulphur. In England, we consume 60,000 tons of sulphur annually, which is imported to this country from the volcanic regions of Sicily. For political reasons, the king of Naples has recently prohibited the export of sulphur to any of the kingdoms now at war. Reckoning the value of sulphur at L.5 per ton, implies a loss of L.300,000—

a pretty liberal 'peace-offering' from the King of the Two Sicilies! This loss of sulphur will be very severely felt for a short time in England; but eventually it will be of great service, as we have as much brimstone in this country as commerce requires—a fact that will soon be made manifest by the demand for it; and when once it is seen that our own resources are sufficient, the king of Naples must never expect us to go to his shop any more. It was thus during the last wars that we prevented the French people from eating Jamaica sugar; so they set to and made sugar from beet-root, and we have lost so much trade ever since—*Septimus Piesse.*

#### A LUXURIOUS AUTHOR.

In this broiling month (July) I use every method in my power to guard against the heat: four servants constantly fan my apartments—they raise wind enough to make a tempestuous sea. My wine is plunged in snow and ice till the moment I drink it; I pass half my time in the cold bath, and divide the other half between an orange-grove, cooled by a refreshing fountain, and my sofa; I do not venture to cross the street but in a coach. Other people are content with smelling flowers, I have hit on the method of eating and drinking them: I protest that my chamber smells stronger of perfume than Arabia-Felix; and I am so lavish of rose-water and essence of jasmine, that I actually swim in it. While my neighbours, at this sultry season, are overloading their stomachs with solid food, I subsist almost entirely on birds fed with sugar; these, with jellies and fruit, are the whole of my diet. . . . My house is neither so elegant nor so costly as Fontainebleau, but it has a charming wood behind it, which the solar ray cannot penetrate, and is admirably calculated for an invalid with weak eyes, or to make an ordinary woman appear tolerably handsome. The trees, covered with foliage to their very roots, are crowded with turtle-doves and pigeons: wherever I walk, I tread on tulips and anemones, which I have ordered my gardener to plant among the other flowers, to prove that the French strangers do not suffer by a comparison with their Italian friends.—*Dulcine.*

#### THE OLD COUNTRY.

And now we are fairly alongside the shore, and we are soon going to set our foot on the land of Old England. Say what we will, an American, particularly a New Englander, can never approach the Old Country without a kind of thrill and pulsation of kindred. Its history for two centuries was our history. Its literature, laws, and language, are our literature, laws, and language. Spenser, Shakespeare, Bacon, Milton, were a glorious inheritance, which we share in common. Our very life-blood is English life-blood. It is Anglo-Saxon vigour that is spreading our country from Atlantic to Pacific, and leading on a new era in the world's development. America is a tall, slightly young shoot, that has grown from the old royal oak of England: divided from its parent root, it has shot up in new, rich soil, and under genial brilliant skies, and therefore takes on a new type of growth and foliage, but the sap in it is the same.—*Mrs Stowe's Sunny Memories of Foreign Lands.*

#### NEW WEATHER-GLASS.

For some years I have been in the habit of watching the condition of the gum in my wife's camphor-bottle, which stands in our bedroom; and when not disturbed, it makes a capital weather-glass. It answers my purpose as well as a barometer that would cost me twenty-five or fifty dollars. When there is to be a change of weather from fair to windy or wet, the thin flakes of the gum will rise up; and sometimes, when there was to be a great storm, I have seen them at the top. When they settle down clearly at the bottom, then we are sure of grand weather. Any farmer who will watch his wife's camphor-bottle for a season, will never have occasion to watch the birds, or locusts, or ants, for indications of a change in the weather.—*Newspaper Paragraph.*

## THINGS AS THEY ARE IN AMERICA.

### CONGRESS.

THE sales of slaves in Richmond were over for the day; and as I had procured the information for which I had made a run into Virginia, I made the best of my way back to Washington by rail and steamer. Among my fellow-passengers were a number of members of Congress, pushing onward to be in time for the day of opening, which was at hand.

In the course of Saturday there were numerous arrivals; the hotels, smartened up after a long dull season, were thronged to overflowing; and there was an air of business in the usually tranquil thoroughfares. On Sunday, I went to an Episcopal church—an elegant new building, which was crowded with a highly respectable body of worshippers.

Next morning ushered in an important day, Monday, the 5th of December, appointed for the assembling of Congress—great excitement in the hotel parlours, groups eagerly discussing who was to be Speaker of the House of Representatives; who was to be appointed printer to Congress (a thing so good that one year of it is considered to be enough); and other matters of consequence. Rumours cunningly floated about to mislead opponents were, as usual, seen through. Every one was on the alert, and ready to be at his post.

At half-past eleven o'clock, I walked down Pennsylvania Avenue with a friend, who kindly undertook to be my cicerone. It was a beautifully clear day, rather cold, but with that lightness and dryness of atmosphere which is peculiar to America. Members were proceeding, singly, in pairs, or several together, towards the Capitol, where they went at once to their respective seats. There was no crowding in the streets to witness the opening of Congress; for there was not a bit of finery or pomp about the whole affair—no procession of President and his court, no corps diplomatique, no carriages, no trumpeters, and no dragons. For anything that could be seen, the Capitol might be supposed to be a church, into which members and spectators were composedly pouring. There was an entire absence of pretension. At the doors of our Houses of Parliament on great occasions, may be seen a number of officials in wigs, gowns, and swords, whose function is to overawe and be insolent—Cerberuses only to be conciliated with cash. The Americans have had the good sense to get rid of these pampered lackeys. My friend and I walked into the House of Representatives unchallenged, and placed ourselves in a recess outside the barrier which bounds the seats of

the members; and here I was introduced to several persons of political notoriety.

The House was full. Representatives from California and other distant states were already present—the whole assemblage forming a body of well-dressed persons, such as you would see any day on 'Change. There was little diversity of costume. A black dress-coat, black satin waistcoat, and black stock, constitute the general attire—ready for court, dinner, ball, public meeting, or anything. A few wore beards, but clean shaving was the rule. Standing, sitting, lounging, talking, according to fancy, they spent the time till noon. 'The moment the hands of the clock point to twelve,' said my friend, 'business will commence.' A clerk, seated in advance, and a little below the vacant chair of the Speaker, kept his eye fixed on a clock over the doorway, and accordingly rung his bell when the hour of noon was indicated.

Every one being seated and in order, the work of the session commenced by the calling of the roll, each member answering to his name. The vote was afterwards taken for Speaker, when, much the larger number having named Linn Boyd of Kentucky, that gentleman was conducted to the chair amidst general plaudits. On the whole, I received a favourable impression of the method of conducting the business of the House, which was simple yet effective. Judging, however, by the accounts given in the newspapers of debates on questions of moment, it would appear that very impassioned scenes occur, and that at such times language is employed which would shock, and would not be tolerated in, the House of Commons. At the same time, I am told that petty means of annoying political opponents while speaking, such as braying, crowing like a cock, and so forth, have not obtained a footing in America; and so far the democracy of the States has an advantage.

The Senate, or Upper House, opens at the same hour as the House of Representatives; and, before departure, I had an opportunity also of noticing some of its proceedings, and being made acquainted with several of its members—among others, the Hon. Charles Sumner, whose eloquent harangues are well known in England.

The plain, business-like way in which legislation is conducted, has been mentioned in disparagement of Congress—a thing not easy to understand. In Great Britain, tradition and precedent are considered to be of so much importance, that arrangements altogether new, however reasonable in the abstract, are viewed with extreme suspicion, and can with the greatest difficulty be effected. In the United States, on the contrary, every subject may be said to stand on its own merits, and is legislated for accordingly. Tho

English, for example, under a habitual respect for what is sanctioned by antiquity, and fearful of disturbing the foundations of a venerable fabric, admit of extensions in the representative system with the utmost reluctance; while the Americans, having no antiquity to venerate, no traditional usages to embarrass, go right up to the point, and organise a code of representation on the broadest possible principle. Whether in doing so they achieve a higher degree of rational liberty, is a different question. What concerns us at present, is the mode of their procedure. Right or wrong, they have had no other course open to them. They have acted under the necessities of their condition.

In England, there has always existed a traditional authority, which, from time to time, has imparted privileges to the people; but in the States, starting at the revolution, there was no authority to impart anything. The monarchical authority was expelled, and power was vested in the people at large. Yet, as a fact in constitutional history, it is interesting to know that the Americans at this crisis in their affairs were not left to organise a government out of chaos. The British monarchy had long previously established Houses of Assembly in its thirteen colonies, and by these agencies, it will be remembered, the new organisation was tranquilly moulded. The thirteen states, therefore, federally united, were but the old colonies, *minus* their English governors, and *plus* the legislative independence they had secured. Besides this inheritance of constituted forms, the States retained the laws of England, with all the ordinary municipal arrangements; and to this day the stranger observes, that each of the original thirteen states possesses, to a lesser or greater extent, the impress which was given to it by its charters from the English monarchy. 'We get copies of all your parliamentary reports, all your statutes,' said a member of Congress to me on visiting the Capitol; 'we know what you are about, and our law-courts constantly quote your procedure.' Could there be a greater compliment paid to England, which, even after a separation of eighty years, is allowed to exert a parental influence over her children? Could America do herself more honour than in making this handsome acknowledgment?

By the creation out of wild territory, conquest, and purchase, the Union, at the time of my visit to the political metropolis, comprehended thirty-one states; and the manner in which these are represented in Congress may be alluded to. The Senate, answering to our House of Lords, is composed of two members from each state, irrespective of its size or amount of population; consequently, the number is sixty-two. These senators are chosen by the legislatures of the several states for the term of six years. One-third retire every two years, by which means a degree of permanency is imparted to the institution. The Vice-president of the United States is the President of the Senate, in which he has a casting vote; in his absence, a temporary president is elected from the body.

The House of Representatives is a purely popular assembly. The members are elected every two years by the people of the several states, and according to a rule fixed by Act of Congress in 1850. By this law, the number of representatives is established at 233. These representatives are appointed by universal suffrage among free citizens—the poorest as well as the richest having a vote. The number of voters for each representative is apportioned to each elective district every ten years; the number is determined by the simple plan of dividing the whole population by 233; the quotient being, therefore, the number apportioned. In the event of a state being admitted to the Union, a member is assigned to it until next decennial period, when a fresh division by 233 takes place. Thus to the ordinary number of 233, one is at present temporarily

added for California, making the actual number 234. Besides these members, the House comprehends a delegate from each of several territories; but these, though allowed to speak on any subject, do not vote. The recent addition of Nebraska to the number of states, will make some change in this respect.

In appointing senators and representatives, whether to Congress or to the legislatures of the several states, the Americans proceed on the principle of asking no public service for nothing. Every member is paid from public funds for his attendance. For a number of years, the rate of compensation for each member of the Senate and House of Representatives has been eight dollars a day during attendance on Congress; no deduction being made on account of sickness. Each also receives eight dollars for every twenty miles of travel by the usual road, in going to or returning from Washington. The Speaker of the House of Representatives is allowed sixteen dollars a day.

There can be little doubt that these payments are sufficiently tempting to induce needy men to seek the post of representative; the allowance, however, is altogether inadequate to compensate the loss which is frequently incurred by a neglect of professional duties, and the expense of living several months from home. As an additional inducement to assume the function of senator or representative, the members of Congress enjoy a large franking privilege. They may send or receive letters or packets free by post not exceeding two ounces, and public documents three pounds, in weight. Members of Congress would be more than human if such a privilege were not as greatly abused as it was in England, when franking was tolerated here. One of the more apparent results, is the enormous increase of matter passing through the post-office—so great as sometimes to retard the mails, and derange the transmission of letters and newspapers. A few days previous to the meeting of Congress, I found the lobbies and passages of the public offices in Washington encumbered with great loads of packages of printed reports, which men were preparing for the approaching demand. Neatly done up in built-tinted covers, these packages, piled in huge heaps, attested the lavish scale on which public documents are printed for distribution, and the labour to be incurred in inscribing them with the magical symbols—*Pub. Doc.*, and signature of a member. We observe by a newspaper, that this extraordinary system of franking is beginning to be seriously challenged; more particularly since it has been proposed to raise the ordinary charge for postage, in order to meet the cost of carrying so much free material. A characteristic paragraph on the subject is subjoined.\*

\* 'When the members reach Washington, they find huge quantities of documents printed and enveloped under the orders of the preceding session, and begin franking right and left. Two or three days thereafter, the stage-routes diverging from the temporary terminus of the railways, especially in the west are choked up by a medley of letters, newspapers, and documents. A stage-driver goes for the mail, and finds twice as much ready for him as his horses can possibly draw. So he picks up two or three bags, and starts off, leaving the residue to a more convenient season; and the next driver finds a still larger pile awaiting him, and treats it in the same manner. Thus we have had a ton of our weekly paper lying at one time at some half-way house on the route, and our disappointed subscribers writing us the most unflattering letters, ordering us to send on the papers they had paid us for, or send back their money. . . . The short of the matter is this: Congress is now paying some half a million of dollars a year out of the Treasury for printing documents, and perhaps a million more for their transportation and delivery to the members' favourite constituents. We think this all wrong—that everything should pay its way—that he who is not willing to pay postage on his documents, does not really want, and will not be benefited by them. Yet we can stand the abuse as it is. But Mr Olds and his Foggy committee, propose in effect to take this load off the Treasury, and put it on the postage-payers. Now, we tell the members of Congress that this won't go down—most decidedly not. So long as they pay the shot out of the Treasury—postage as well as printing—the people won't mind it; but from the day that letters are made to pay

With an extensive and clear field in their favour, and no embarrassment from antiquated usages, the United States have been able to accomplish aims for the good of society which Great Britain has found utterly impracticable. In organising systems of national education at the public expense, the several states have, for example, completely outstripped the old country. Yet as, in this respect, monarchical Canada is quite as far forward as the States, it would be an error to suppose that republicanism is the cause of the remarkable step in advance. Candidly considered, it will be seen that the legislation of the United Kingdom, when obstructions are overcome and an intelligent public feeling fairly roused, is abreast, if not ahead, of that of Congress. I would, in particular, call attention to the strides in advance made by England as regards freedom of commercial intercourse and navigation, leaving America to come laggingly behind, along with the nations for whom she, politically speaking, entertains anything but respect. The people of the United States, if true to themselves and the principles of a sound political economy, ought not, for the sake of special interests, to have been second in this great movement—will they even be second? Need I add, that the Americans have done themselves no honour in so long postponing the enactment of an international copyright treaty—a subject legislated upon years ago by Great Britain.

In the matter of cheap postage, the States have had the misfortune to be imitators of England, instead of taking the initiative; moreover, with the full knowledge of the post-office organisation of the United Kingdom, and possessing an overplus revenue, the Americans have strangely failed to place their postal-system on a footing so perfect as it might be. The franking privilege, accorded not only to members of Congress, but (restrictedly) to an inferior class of postmasters, is an abuse which surprises us to see still tolerated. More remarkable is it to find that the ordinary rate of prepaid postage of three cents for a single letter, does not infer delivery. When the American post undertakes to convey letters and newspapers, the service extends only to their transmission from post-office to post-office. For their delivery at the house of the party to whom they are addressed, there is an additional charge of one or two cents. It is an ordinary custom everywhere in the States, to call for letters or newspapers at the post-office, and by an arrangement with the postmaster, each person has a box into which his correspondence is put. In New York, I observed great crowds daily at the post-office seeking for letters. Let this monstrously inconvenient practice be compared with the plan pursued in London, of sending out four or five times a day a host of carriers, each with his bundle of letters and newspapers for delivery at the doors of the parties to whom they are addressed, without any additional charge. An American gentleman, who had been some time in London, mentioned to me, that nothing surprised and delighted him so much as the incessant distribution of letters; care being taken to transfer the carriers in detachments to their respective beats by means of rapidly driven omnibuses. 'Your government,' said he, 'is completely ahead of ours in this respect. We could not do better than transfer your postal-system, *body and bones*, to the States.'

Legislation in these, as well as matters of more grave concern, is of course regulated by the expression of public sentiment; but in no country is it more difficult than in America to ascertain what really consti-

tutes the unprejudiced feeling of the community. The States are not one, but many nations, united by a common interest, but differing greatly in social usages and opinions. Subjects of important concern are viewed in one light by the north, and in another by the south; just as it might be expected to be by nations in the north and south of Europe. Then there is the universal division of society into Whigs (answering in some degree to the English Tories or Conservatives) and Democrats, or extreme Republicans. Beyond these distinctions of genera and species, there is an indefinite number of varieties and sub-varieties—Free-soilers, Hunkers, Hards, Softs, Woolly-heads, Doughfaces, &c., rather puzzling to the uninitiated, yet of practical significance; for I observe that in some cases of examinations before judicial tribunals, the party sobriquet of witnesses is appended to their names in the published record of proceedings—as if credibility of evidence depended on political opinion!

Party-spirit is, to all appearance, the soul of American society—regulating and controlling everything. What any man says or does is too commonly judged by the press according to the opinion he entertains on political subjects. Bad as we are in this respect in England, we do not go quite this length, unless when sectarian interests are concerned—there, we regret to say, our so-called religious newspapers possess the worst features of the least respectable American journals. A natural consequence of the fierceness with which persons are attacked for their political sentiments, is an indisposition to mingle in public affairs. I was told over and over again in the States, by people of substance and intelligence, that they shrunk from appearance in public affairs—would have nothing to do with the vulgar wranglings at elections—left things to go any way. This can hardly be considered a sound state of things, for it amounts to delivering up the country to the most noisy and viperish of the population. In New York, as has been observed, the civic government has, from this cause, been practically in the hands of the mob, from which, however, as I understood, a spasmodic effort of the more respectable classes was about to rescue it.

'Things will be better for a little time,' said a gentleman of New York, speaking to me on this subject, 'but they will soon fall back to their former condition—the most noisy and calumnious will carry the day.'

We are scarcely entitled to make this a special charge against the democracy of the States, for a similar reluctance to take part in political movements is observable among certain classes in England; and such must ever be the case until the world is better instructed, and knows and feels that in constitutional governments, the franchise is as much a duty as a privilege. The keen party-spirit, the corrupt practices, the intimidation, the obloquy cast on opponents, are all dwelt upon as grievous sins in the republican elections of America—the ballot is spoken of as a sham. True, perhaps, in every particular; but after recent experiences, can any Englishman have the conscience to hold up the finger of scorn on account of these real or alleged imperfections? On such a subject, the fact of so many members of the House of Commons being convicted of bribery and corruption—and of so many others being ordinarily elected through the meanest venal influences—ought at least to make us careful how we utter a reproach.

Whatever be the faults of the American government, it cannot be said that extravagance is one of them. The Minister of the Exchequer is not called on to devise schemes of taxation to make the two ends meet. His only difficulty is a very strange one—it is what to do with the money in the public Treasury! In 1853, the entire expenditure of the government of the United States was \$1,000,000, and the population was 23,000,000.

wants each extra to take this load off the Treasury, there will be a low muttering, which those who put their ears to the ground may hear; and the members from the free states who vote in favour of the change, will get badly scratched whenever they are candidates again. If they don't believe it now, they will, after trying

of dollars. By accumulated balances, there was at the same time on hand the sum of 75,000,000 dollars; and how this money should be disposed of, was a matter of very serious concern. To be sure, there was a debt of 65,000,000 dollars; but it was at a high premium, and by a sacrifice it could easily have been discharged. Portions of the debt were, indeed, being paid off, when opportunities offered, and in a few years the whole will be extinguished, without impairing the balance. At present, a variety of schemes are on foot for disposing of this unfortunate overplus. All intelligent individuals, of course, see that the rational mode of procedure, is to abolish certain branches of revenue; and so bring the draughts down to the necessary outlay. But to this there are objections on the part of the manufacturing community. The federal government levies no direct taxes on the people. Its revenue is principally from custom-house duties, which in 1853 amounted to nearly 59,000,000 dollars. Now, these duties are of a protective character. They tax the nation at large, by an aggravation of prices, in order to give a monopoly to certain branches of native industry; and their removal or considerable modification would be equivalent to free-trade, which the public mind, jealous of foreign competition, is not prepared for. Meanwhile, the accumulating cash in the Treasury presents a dilemma of a different kind. It is universally felt to be a source of corruption and danger. Every faction is scheming to have a clutch at it. As a spare fund at command, it may induce some rash warlike expedition, or be otherwise employed in the undue extension of the Union. A third evil connected with it, is the gradual abstraction of money from circulation, in order to be locked profitlessly up in the Treasury; thereby starving commerce of its proper means of support. So that, if things go on as they are doing, the curious conjuncture may come about, of all the available money in the country finding its way into the national Exchequer, where it is not wanted, and trade, accordingly, being brought to a stand. Any way it can be viewed, the accumulation is considered to be most pernicious in its effects, both as regards administrative policy and social wellbeing; and the gravest politicians admit that, in comparison with the evils of the present system, an annual deficit would be a national blessing. After all, there would seem to be worse things than a National Debt!

While attending the opening of Congress, it was explained to me that much was done in the way of *lobbying* and *log-rolling*—phrases unknown in England, though the things signified are by no means wanting. By *lobbying*, is meant the influence exerted privately on members by interested parties hanging about the lobbies of the Capitol; and it is said jocularly, that in the passing of bills as much depends on the activity of members for the lobby as on the real representatives. It seems to be one of the duties of these lobbyists, to make such compromises among parties as will induce them to support the measures of each other. One member, for example, wishing to carry a bill for a grant of public land towards a projected railway, and another desiring to extend slavery into a new state, will, by discreet management, be induced to assist each other with a vote. Such is *log-rolling*: mutual assistance by a compromise, as it may be, of principle.

As we all know, splendid examples of *log-rolling* are of daily occurrence in the House of Commons, through the agency of party whippers-in; and neither are we altogether deficient in a practice, equally irregular, which the Americans describe as 'speaking for *bunkum*.' I heard of some interesting cases of *bunkum*, by which is signified the bringing forward of a sham proposal, in order to catch popular applause. A member, for instance, desirous of standing well with his constituents, makes an oratorical display in favour of a measure in which they are interested; but with the

knowledge that such a measure is impracticable, and will not be carried. In fact, he does not want to carry it; the sole object of the orator is to impose on his supporters, and acquire the character of a meritorious public leader. I was told that in one of the state legislatures, a bill for the Maine Liquor Law was proposed, entirely with a view to *bunkum*. It was, indeed, passed by the Lower House; all the members who voted for it having dishonestly thrown the odium of rejection on the Senate. The Senate, however, seeing through the trick, passed the bill also; and, finally, the governor appended his assent, rendering it a law—the whole thing, from first to last, being a piece of mutual deception. The result was, that in the state in question, the law became practically a dead-letter. That such actually was the occurrence, I am unable to say from my own knowledge; yet I think the circumstance, as related, must possess a certain degree of truth, for I observe by a newspaper, that in a neighbouring state, where a similar law has just been enacted, the people are recommended 'to organise a club or league in each township and city, to take care that this act is promptly and thoroughly enforced,' because, 'if this is not done, the act will prove only a sham and a disgrace.' Are we to understand from the counsel thus given by the press, that the enforcement of laws is to depend on popular leagues or clubs?—a doctrine which would argue prodigious weakness in the ordinary executive power.

It does not appear that the President of the United States holds any personal intercourse with Congress. As has been shewn, he does not, at least, attend at the opening of the session; a day or two after that event, he sends his Message, a voluminous document, to be read to the members. To one accustomed to the outward forms of respect for sovereigns in Europe, the manner in which the President and his measures are sometimes referred to, appears to be inconsistent with the high position he occupies. The latest American newspaper which has come to hand, gives an account of his being burned in effigy, on the ground of his connection with the Nebraska bill. The function of the President, however, is more analogous to that of a prime-minister than a king. He is a responsible officer—only the first magistrate of the republic. The comparatively small salary allowed him cannot be expected to go far towards keeping up the paraphernalia of state. It amounts to only 25,000 dollars (£6000) per annum; and as the President is appointed for only four years, the pecuniary advantages are not great. Perhaps the patronage belonging to the office is an object of no inconsiderable importance. According to a practice now of some standing, it is usual for every new President to dismiss some thousands of persons from office, and to appoint his own supporters in their stead; the consequence of which is, that a large number of individuals naturally become agitators for a presidential change. We are accustomed in England to see vacant offices filled by the party in power, on account of political bias; but expulsion is unknown, unless for incompetency, or on some other grounds equally valid. Should the projected arrangement be carried into effect, of appointing persons to civil offices only after they have undergone an examination as to competency, Great Britain will have made a signal step forward in administrative policy, eminently worthy of being copied in the United States, where things, in this respect, are about as bad as they can possibly be. The present President being a Democrat, and democracy having the ascendant in Congress, offices are, of course, filled with Democrats, greatly to the chagrin of the Whigs, who live in the expectation that, by a happy turn in affairs, their time of office is coming. All writers, native and foreign, deplore this most mischievous custom of changing the ordinary and bumble officials of government,

according to the rise and fall of party; and it undeniably forms one of the worst features of the American state.

At Washington, as well as other cities I visited, everybody with whom I had the honour of conversing on public matters, spoke with respect of England, and entertained the hope that nothing would ever occur to cause any serious disagreement between that country and the States; and such, I imagine, to be a very general feeling in America, notwithstanding the occasional remarks of a contrary nature by a portion of the press. I need hardly say, that I reciprocated the sentiments of good-will which were expressed, and perhaps was not thought the less of for giving it as my impression, that the least admirable thing about the government of the States, was the extreme deference to popular clamour. 'You are,' I said, 'great, wealthy, and with a boundless field of well-doing; your public economy is, in most things, worthy of all praise; but if legislation is to be conducted on the principle of yielding to every gale of popular and inconsiderate impulse—if you do not take time to reflect on consequences—you may be impelled into the most dangerous course of policy; your day of trouble may not be far distant.' Late events, afterwards to be alluded to, do not leave these hints unjustified. W. C.

#### FACTS AND FABLES ABOUT FLOWERS.

WHY is it that every eye kindles with delight at the sight of beautiful flowers? that in all lands, and amidst all nations, the love of flowers appears to prevail to so great an extent, that no home is considered complete without them—no festival duly honoured unless they decorate the place where it is observed? They are strewn in the path of the bride; they are laid on the bier of the dead; the merry-maker selects from the floral tribes the emblem of his joy; and the mourner, the insignia of his grief. Everywhere, and under all circumstances, flowers are eagerly sought after and affectionately cherished; and when the living and growing are not to be obtained, then is their place filled by some substitute or other, according to the taste or circumstances of the wearer; but whether that substitute be a wreath of gorgeous gems for the brow of royalty, or a bunch of coloured cambric for the adornment of a servant-girl, it is usually wrought into the form of *flowers*. The very furniture of our houses vouches for the prevalence of this passion; for we seldom see a carpet, a chintz, or a paper, that does not include flowers in its pattern. Our china tea and dinner services are richly enamelled with groups of these graceful objects; and on our Parian jugs and butter-coolers, our vases and chimney-ornaments, we find the moulded forms of lilies and snow-drops, and other such delicate floral imagery. Whence comes this all-prevailing taste? Surely it is a gift from God, planted by him in the heart of his creatures; for the capability of the heart to enjoy it belongs as much to the peasant as to the prince, and the means of gratifying it is as free to the one as to the other. This taste depends not on wealth or on education, but is given, if not to all individuals, yet to some of every class. From the infant's first gleam of intelligence, a flower will suffice to still its cries; and even in old age, the mind which has not been perverted from its natural instincts, can find a calm and soothing pleasure in the contemplation of these gems of creation. The little peasant-boy who basks on the bank in the corn-field, whilst his parents are busied in gathering in the golden grain, amuses himself by weaving a bright crown of the glowing scarlet poppy, and the brilliant blue corn botter, wherewith to bind the auburn curls of the tiny sister whom he has been left to watch; and the feeble old woman will totter on her crutch at early day to inhale the scent of her sweet double gillyflowers, and

mark the unfolding of their clustering petals. The sick and dying love flowers; for they remind them of that sweet home at which they are hoping soon to arrive, where, as sings an old poet—

Thy gardens and thy goodly walks  
Continually are green,  
Where grow such sweet and lovely flowers  
As nowhere else are seen.

And the young and healthy love flowers—oh, how dearly!—and delight to ramble through the lanes at the sweet April-time in search of the first young violets

That strew the green lap of the new-come spring;

or in July to wander in the dewy meadows by the river's side, and stretch far over its waters—even at the risk of getting an untimely and unwelcome bath—for the sake of attaining some of the pearly cups of the delicate water-lily (*Nymphaea alba*), or gathering a bunch of the turquoise clusters of the lovely water 'forget-me-not' (*Myosotis palustris*). The costly gems which adorn the prince or the noble are obtained only by the few; but those more pure, more fragrant ones, may be had freely, abundantly, without asking them at the hand of men. The hill and the valley teem with them, the mountain and the rock, the moss and the moor, 'bring forth spontaneous flowers of all hues'—flowers

Which not nice art  
In beds and curious knots, but Nature's boon  
Poured forth profuse on hill, and dale, and plain.

Every hedgerow displays its wealth of blossoms, and even the very walls and house-tops supply us with their own bright and peculiar floral embellishments.

Flowers are the subject of poets' dreams: we may cite in token Chaucer's sweet tale of *The Flower and the Leaf*, and Dunbar's—

Methought sweet May before my bed up stood,  
In weed depaint of many diverse hue, &c.;

and plenty of other instances. They are emblems of nations. They serve as badges of clans, and display themselves in the blazonry of heraldic devices. They have formed the insignia of party strife and hatred, as in the fatal and long-sustained wars between the houses of York and Lancaster. They have been used as indications of renewed amity and friendship, as when the reunion of these two houses did 'unite the white rose with the red;' and as Drayton sang—

In one stalk did happily unite  
The pure vermilion rose and purer white;

and the striped red and white rose, called at this day 'The York and Lancaster,' was worn peacefully by both parties alike.

That the love of flowers of which we speak is a true thing, and that it has pervaded all nations, and existed throughout all times, the many legends in which we find flowers bearing a prominent part, and forming the basis for traditions and fabulous tales, supply proof sufficient. In the records of the old Grecians and Romans, we find abundance of these floral myths; and we will now entertain our readers with a few of them. The *Flos Adonis*, a pretty little blood-red flower of the anemone tribe, bears the name, and serves to perpetuate the memory, of Venus's favourite, Adonis, the son of Myrrha, who was herself said to be turned into a tree called *myrrh*. Adonis was often cautioned by Venus not to hunt wild beasts; but he slighted her advice, and at last perished from injuries received from a wild-boar he had wounded, and his weeping mistress changed him into this flower.

Narcissus, too, bears witness to the love of the ancients for flowers. He, striving to grasp his own

beautiful form, as he saw it reflected on the surface of the water—but striving all in vain—in his futile exertion slew himself, and his blood was changed into a flower. But what flower was this? Surely not the snowy blossom which we designate by the name of *Narcissus poeticus*. Virgil calls the classical flower *Purpureus Narcissus*, and Pliny also speaks of it as purple; and we should be much more inclined to fix on the flower which the older botanists, Gerard and Parkinson, call the 'chequed' or 'chequered daffodill,' and which we name the April Fritillary, for that which ought to bear the name of *Narcissus*. Gerard says of this as follows: 'The chequered daffodill, or ginny-hen flower, hath small, narrow, grassy leaves; among which there riseth up a stalk three hands high, having at the top one or two flowers, and sometimes three, which consisteth of six small leaves chequered most strangely; wherein nature, or rather the Creator of all things, hath kept a very wonderful order, surpassing, as in all other things, the curiosest painting that art can set down. One square is of a greenish-yellow colour, the other purple, keeping the same order as well on the backside of the flower as on the inside, although they are blackish in one square, and of a violet colour in another, insomuch that every leaf seemeth to be the feather of a ginny-hen, whereof it took his name.' The dull purple tint of this flower may more fitly indicate that which sprang from the blood of

Foolish Narcisse, that likes the watery shore,  
than the pure white of the other.

*Hyacinth* is the next fabled hero we shall cite as bequeathing his name to a flower; but here is another ambiguity. The sweet-scented flower of various hues, blue, purple, white, or pink, which we thus designate, has, in reality, no claims to this classical appellation. It seems to be now generally admitted, that some species of lily, and probably, according to Professor Martyn, that called *Lilium Martagon*, the 'scarlet Turk's cap,' is the one thus honoured. The colour and scent of the so-called hyacinth, and the fact that it has no dark marks on the petals, would surely imply that it is not that which Virgil describes as 'rubens,' or 'ferrugineus,' and of which Ovid says—

*Ipsæ suos gemitus foliis inscripsit Ai Ai,  
Flos habet inscriptum funestaque litera ducta est.*

But the colour, the offensive smell, and the deeply stained petals of some of the red lilies, may be well considered as more suitable appendages to a flower of such evil origin. We give this poetical tale in verse, as best suited to its romantic character:—

Apollo—

A being fraught with all earth's richest gifts,  
Was closely bound in love with Deion's son,  
Young Hyacinthus. He, with all the force  
Of youth's deep love, was to Apollo knit.  
Young Zephyr also loved the noble boy,  
And sought return; but youth can never spare  
One gleam of love from that one charmed spot  
To which its soul is anchored. He was cold,  
Nor met young Zephyr's love. Ah! why should love,  
That joy of life, that precious comforter,  
So often turn to hate? 'Twas thus with that  
Of Zephyrus! He hated, and but sought  
Fit time to gratify his passionate wrath.  
One day, Apollo, who had charge to guide  
The boy's young mind through learning's glorious path,  
Played with his pupil; Zephyrus was near;  
Apollo threw the quoit; then Zephyr, prompt,  
Seized on the disk, and bore it through the air  
To where the beautiful boy stood, full of life,  
And with its fall, laid him a bleeding corpse.  
Apollo, mad with ire, beheld the child—  
That child within whose heart was garnered up  
His own, now lying there mangled and dead!  
The legend further tells, that he then raised

That wasted blood, and made this scarlet flower  
Spring from the dismal flood, and on its leaves  
Impressed the words of grief: 'Ai, Ai!'  
His bruised, fading body then he took,  
And set it in the firmament to shine,  
A beaming star for ever, 'mid the host  
Of ancient fires that kindle up the night.

The daphne, the myrtle, and many more, all come springing forward in our memory, and claiming a place in our pages. Daphne was a fair nymph, the daughter of the river Peneus by the goddess Terra; and fearing to be overtaken by Apollo, who pursued her, she entreated the gods for aid, and was by them turned into a laurel. Apollo gathered a crown of leaves from his metamorphosed love, and ordered that ever after that tree should be considered as sacred to his divinity. But the daphne is not the plant we usually call the laurel. The former is a most odorous flowering shrub, not even of the laurel tribe. There is no laurel indigenous in Greece; but there is a daphne native in Pontus (*Daphne Pontica*); and this, no doubt, is the plant to which this tradition belongs.

The story of Myrtillus is, that the father of Hippodamia declared that no one should marry his daughter who could not conquer him in a chariot-race; and one of the lovers of the young lady bribed Myrtillus, who was an attendant of Enomaüs, to take out the linchpin from his master's chariot, by which means the master was killed; and Myrtillus, repenting when he saw him dead, cast himself into the sea, and was afterwards changed by Mercury into this plant, the myrtle, or, as some say, into the whortleberry (*Vaccinium myrtillus*).

Of the bladder campion (*Silene inflata*), named after the god Silenus, ancient writers say that it was formerly a youth named Campion, whom Minerva employed to catch flies for her owls to eat during the day, when their eyes did not serve them to catch food for themselves; but Master Campion choosing to indulge himself with a nap, when he ought to have been busy hawking for the wise birds, the angry goddess changed him into this flower, which still retains in its form the bladder in which Campion kept his flies, and droops its head at night when owls fly abroad, and have their eyes about them.

The legend of Clytia, who, irritated and aggrieved by the falsehood of her lover Apollo, pined away, and was changed into a flower, must close our list of antique flower-fables. This flower is usually considered to be the sunflower (*Helianthus*); but it might more properly be said to be the *Helianthemum polifolium*, or white rock-rose, which sheds its leaves when the sun declines; and its snowy and fragile petals are more suitable as a memorial of pining lovers, than is the gorgeous beauty of the flaunting yellow helianthus.

These are a few amongst the mythic tales we find in pagan lore; but the traditions concerning flowers are not confined to the days of Venus and Apollo: much later times furnish us with quaint theories relating to the variations in tint, form, &c., of the subjects of Flora's dominion. Of the wall-flower, that most beautiful as well as most odorous of cruciferous plants, the graceful, though somewhat fanciful, poet Herrick tells us thus:—

Why this flower is now called so,  
List, sweet maids, and you shall know;  
Understand this firstling was,  
Once a brisk and bonny lass,  
Kept as close as Danaë was;  
Who a sprightly springal loved,  
And to have it fully proved,  
Up she got upon a wall,  
'Tempting down to slide withal;  
But the silken twist untied,  
So she fell, and, bruised, she died.

Love, in pity of the deed,  
And her loving, luckless speed,  
Turned her to this plant we call  
Now 'The flower of the wall.'

The tulip, albeit in its own characteristics not especially suggestive of poetic thoughts, has, nevertheless, been the subject of more interest in later days than perhaps any other flower of modern or ancient celebrity. The *facts*, however, about tulips are well known; but we have one of the prettiest of all *fables* concerning them to narrate—a real fairy tale, quite worth the hearing. Down in the south and west of that fair county, Devonshire, lies a wild and desolate tract of hill-country, called Dartmoor. This district remains in almost primeval simplicity, its deep solitudes but seldom invaded by the foot of man, its few and simple inhabitants almost as uncultured as its wild mountains and morasses. Here, amidst the rough relics of the homes of our ancient British forefathers, linger the remains of the dress and habits of former days; and here, too, are found remnants of the superstitions which prevailed of old.

In one of the sylvan glens which lie amongst these Tor-crowned hills, there lived, once on a time, an old woman, who was the happy owner of a pleasant rustic cottage, with a garden full of sweet flowers. There was the 'brave carnation,' rich with its clove-like fragrance; there was the clustering rose, forcing its way over the little porch, and climbing on the dark brown thatch; there, too, was a little rill coursing along the side of the cottage, its rushing waters making sweet melody as they broke over the stony bed through which they ran, and mixing their tones with the song of many birds, and the clear hum of the good old woman's bees, as they gathered honey from the wild-thyme and the dewy foxglove on the hills around. But although, no doubt, all her flowers were charming to the old lady, there was one treasure in the garden which was her chief delight, and exceeded all the others. This was a fine bed of most beautiful streaked tulips, over which she watched with warmest interest. One fine moonlight night, it seems the dame sallied forth to view her property, when her attention was arrested by a sweet gush of soft music, which rose and fell on the air in gentle cadence. It was as if a thousand tiny voices had joined in unison; clear and shrill, as if from the throats of so many grasshoppers, but as soft as if it had been produced by as many little feathered moths. With wonder and delight, the old woman gently drew near to the point whence the harmony seemed to arise, and found that it all emanated from the bells of her own many-coloured tulips, which she could now see bending and waving in the night-breeze. She watched her darling flowers with intense interest, and at last she saw by the light of the moon, then just at its full, that it was not the *wind* that swayed her tulips, but that there were thousands of lovely little beings climbing on the stems and leaves, and clustering amongst the powdery anthers of the blossoms, and that each of these tiny creatures held one tinier than itself in its arms. They were the pixies—or fairies, as they are called elsewhere than in Devonshire—who had brought their elfin babes to lay them to sleep in the chambers which these lovely blossoms afforded, and the music was the lullaby with which they were composing their infants for their rest. As soon as the little ones were fast asleep, the old woman saw the parent fays speed away to gambol in the fields around, where they spent the rest of the night in dancing in rings, and other fairy-like diversions, to which the marks on the grass the next morning bore testimony. At the earliest dawn, the old woman—who, of course, kept on her watch all night—saw the elves return to the tulip-bed, and taking up their babies with many kisses and caresses, bear them

away to their own domains. Some say that the watcher did not *see* these things, but only heard the sweet music, and the caresses of the parent fays; but on this subject we can give no opinion, for the one statement seems as likely to be true as the other. However it may be, it is said that these favoured flowers retained their beauty much longer than others of their tribe, which is no more than was to be expected; as also that, from the pixies breathing over them, they became as odorous as the Rose of Cashmere.

Whilst the old woman lived, she would not even allow a blossom to be gathered; but at last she died, and her less romantic and more utilitarian successors transmogrified the bed of tulips into a parsley-bed, much to the disgust of the fairies, who caused it to fade and die; and not only so, but they so managed that nothing would grow in that garden for years. But it seems they bore the memory of the old woman, who had thus protected their nursery, in affectionate remembrance—no weed was ever suffered to spring on her grave, but the greenest turf and the fairest flowers were ever found there, though no mortal hand tended the place where she lay; and this state of things continued until it might be supposed that the remains of their friend were wholly decayed, and resolved into the elements out of which they were created; and every month, on the night before the moon was at the full, the grateful sprites might be heard lamenting her loss in tuneful dirges at her grave.

#### THE LONDON CHAR-WOMAN.

'GIVE us a brown, sir—O do, sir—do, sir, give us a brown, sir—had no wittles since istryer artemnoon, sir!'

Such was the appeal of a ragged urchin of some nine years of age, as he skipped before me with shoeless feet in the mud, which he had made an ineffectual attempt to scrape out of my path with the worn stump of a birch-broom. The boy looked pale and hungry, though sharp, eager, and vivacious as a ferret; and it seemed probable that he spoke the truth.

'No victuals!—how comes that? Have you no father?'

'Yes I have, sir, and mother, too; but father broke his leg off the scaffold, and mother can't get no work.'

'And what does your mother work at?'

'Her chores.'

'Her chores!—That's a text, I am inclined to think, from which a pretty lengthy sermon might be preached by any man given to long-winded orations. The boy meant to say, that his mother sought, by acting as char-woman to any one that would employ her, to supply the place of her crippled husband. What are the special duties of a char-woman, I do not pretend to be able to define with perfect accuracy; but I do know, that just as the profession of a schoolmistress is the refuge for destitute females of a certain class, so is that of char-woman a like refuge for another class. It is a profession which involves the performance of duties of a remarkably practical kind, to which no degree of éclat, no prestige of notoriety is attached: nobody ever heard of an honorary char-woman. Its emoluments have never, to my knowledge, been the subject of statistical inquiry, or its functions of regulation by authorities official or magisterial. It has been insinuated, that while other professionals have to study and struggle in order to *rise* into a position and sphere of practice, the candidates for the office of char-woman qualify themselves for the proper performance of its duties by a species of inverse progression, which, in the

course of time, and by the lapse of opportunity, leads down to it—that, in fact, it cannot be approached by any upward movement at all. Does a woman fail in the vocation of cook, then, assuming that of housemaid, fail in that too—then, transforming herself into a maid-of-all-work, fail again?—she is qualified as a char-woman from that time forth. Does a sempstress, weary of the everlasting 'stitch, stitch, stitch,' and perhaps half-blinded by the perpetual strain upon her eyes, abandon the needle and thread, and hopelessly resign herself to fate?—fate deposits her at once in the rank of char-women. Is the wife of an artisan or a labouring-man overtaken by adversity?—is her husband laid up by sickness?—has he abandoned her to go a gold-digging at the antipodes?—is he dead? or, worse still, is he alive, and daily drunk?—in either of these cases, the poor woman, as a matter of course, enlists as a char-woman. Besides these, there may be, for aught I know, a hundred different tracks marked out on the chart of woman's eventful life, which land the poor tempest-tossed voyager at this undesirable haven. At anyrate, the profession is one which, though lacking in any very inviting attractions, is undergoing continual augmentation, and, consequently, suffers in its emoluments from continual competition.

Owing to the very various sources from which the ranks of this numerous sisterhood are recruited, it is difficult to define, with anything like exactness, the physiology of the individual. You may regard her, if you choose, as a devout worshipper at the domestic altar: she is often upon her knees before it; but she prefers a very noisy, clamorous kind of adoration; and her piety is of the abstract species, not paid to any particular *penates*, but to the household gods of universal man or woman who may be standing in need of her ceremonial rites. Candour compels the declaration, that the char-woman prefers the service of man, young or old, unmarried or widowed, to that of her own sex. Not that she is to be accused of any design upon his personal liberty; but she counts more upon his amiable ignorance of household mysteries, and the permanence of household stores—especially of such small matters as fall unavoidably under her control in the course of the cleansing, soaping, rubbing, scrubbing, polishing, and brightening of the sanctuary of home—concerning all which particulars, she generously supposes him too much of a gentleman to demand a fractional account. Where there is a mistress, the credit and the privilege of these little responsibilities do not devolve on the char-woman.

The costume of this sisterhood is as various as their character and antecedents, and may be regarded, perhaps, in some degree as an indication of both. In general, however, it may be remarked, that their outer integuments have a tendency to coagulate in tumours and amorphous bundles about the loins, and at the same time to trail sweepingly at the heels. I have heard it affirmed, that the celebrated Dorothy Draggletail, of harmonious notoriety, was a char-woman; and a friend suggests that she might be taken as a type of the class. I am not so sure upon that matter; the class being so very numerous, and the good woman who at this moment is clattering about in the kitchen below, being a type of a very different order—not only an example of neatness in her own person, but in the persons of two young fatherless children, whom she maintains by her arduous labour. She happens to be

the only teetotal char-woman that ever came beneath my notice, however; and as I am a bachelor of fifty, and, in a small way, a man of observation to boot, I suspect this fact may be regarded as evidence that total abstinence is not extensively practised among them. But Mrs Pottler, like a woman who has seen the world, makes a market of her temperance—and who shall blame her for that, seeing that so many foul wares are brought to market, and fetch a high price? In demanding an extra sixpence a day, in lieu of beer and gin, she practically asserts the value of the virtues which all praise, whether they exercise them or not; and her employers, in acceding to her demand, I am persuaded, lose nothing by the compact.

The rarity of total abstinence among these untiring vestals, may be due to the very lowliness of their lot, which drives them to seek consolation in such brief joys as they can snatch from the present, for the loss of those vanished hopes which have long ceased to gild their prospects of the future. I have had opportunity of noting, during some of those great domestic revolutions which take place occasionally in the best regulated households, that when two or more char-women get together, whether it be around the tea-pot or the black bottle, their conversation is invariably of a melancholy and retrospective kind; and if the sitting be continued long, and the libation be alcoholic, the melancholy deepens, and the retrospection becomes dramatic and tragic. Like their ancient friend and brother, honest Dogberry, they have had their losses—far be it from us to say that they have deserved them. They are always unanimous in deploring the departure of the 'better days' which they once knew, and of which they cherish a remembrance all the dearer to them that they know they are gone for ever—thus exercising, without knowing it, a species of philosophy which the serious and didactic poets have long been striving to inculcate. It is owing to these sentimental remembrances, it may be, that the modest stimulants which excite and exalt others, depress them; and that the most pardonable excess makes them often mandarin, but never merry. So I have come to the conclusion, that though the mass of the profession differ physiologically more, perhaps, than do the members of any other profession that could be named, they are united by one remarkable characteristic—namely, that of resignation; a virtue, if it be a virtue, which, in these fast and stirring days, they almost exclusively monopolise.

Scandal is often busy with the subjects of our sketch. Deficits in household stores, if they cannot be otherwise accounted for, are unscrupulously set down to their agency. They are accused of surreptitiously meddling where they have no concern—of wandering unaccountably into beer-cellars, and groping mesmerically in wine-bins—of exercising a comprehensive philanthropy among a numerous circle of relatives at the expense of their employers—of coming to work in the morning thin, spare, and cylindrical, and of departing at night in an unsightly bulbous, tuberculous condition—and of fifty other things, which I hold it invidious to set down. To all such charges, I turn, on principle, a deaf ear. The man or woman either who cannot submit to be cheated a little, is not fit to live in this world, and need not reckon upon my sympathy. The true, I should like to see that pair of slippers again unaccountably after I had worn them twice; and if the good woman who preceded Mrs Pottler in the Saturday sovereignty of the basement-floor of the respectable house in which I lodge, *did* remove them by mistake in one of those fits of abstraction to which I know she

was unhappily subject, and will return them to me 'per Parcels Delivery,' I shall be happy to pay the carriage, and will retain a grateful remembrance of the act of restitution.

## THE HEIR-AT-LAW.

### CHAPTER III.

CAPTAIN TOULMIN had, we found, already left the Priory, after hurriedly excusing himself to his mother and Mrs Herbert, by the pretext of urgent and suddenly remembered business affairs. He did not reappear till three clear days had elapsed, and then looking like a man recently fallen from the clouds, and hardly yet certain whether he had alighted upon his head or his feet. His bearing towards Clara was awkwardly but strictly in accordance with the prescribed pattern—a change which terribly mystified Mrs Selwyn, and for a time evidently disconcerted and annoyed Clara. Pride, however, as her sister anticipated, soon came to her relief, and before the discomfited captain's uncomfortable visit terminated, her manner was as cold and haughty as his was affectedly indifferent and neglectful: there was no longer, thank Heaven, any fear that her affections had been seriously entangled. The man was possessed of astonishing self-command; but for all that, an attentive observer could easily see frequent flashes of the volcanic rage within break through the exterior mask—prophetic of vengeance upon Mrs Calvert and her relatives, should fate ever place the means of inflicting it within his power. And that passionately longed for opportunity would, it daily became more clearly apparent, be ere long afforded him. Little Francis drooped rapidly: he was not precisely ill; that is, no cognizable, definite malady had as yet attacked him, but he suffered under an increasing *malaise*—a dejection of spirit which would almost certainly render him an easy prey to any active disease by which he might be assailed. This was more evidently than ever Mrs Calvert's decided conviction, and greatly contributed, of course, to the pleasure she felt, and she could hardly help openly expressing, at observing the fresh life and vigour that marked the hymeneal aspirations of the reverend rector since she, to him and others, unaccountable withdrawal of Captain Toulmin's formidable pretensions. Very natural in an attached sister was that pleasurable feeling. A union with the Rev. Charles Atherley would place Clara high out of adverse fortune's reach; and that great point secured, no other evil of any magnitude was to be apprehended. Mary herself, it was understood, enjoyed a quite sufficient income, though to what amount was not known, she being the very reverse of communicative upon the subject; and Mrs Selwyn would be fairly enough provided for by the Selwyn one-hundred-a-year patrimony, and the rent of Beach Villa. The future of myself alone seemed entirely bleak and cheerless, but even for me Mary had words of encouragement and hope; and it was in a manner tacitly agreed between us, that if our fears were realised, I should abide with her till, at all events, a more eligible home presented itself for my acceptance. The duration of Mrs Calvert's stay at the Priory, I should mention, was governed by two motives: in the first place, her own children being, as she told me, in perfect health, and under the care of trustworthy persons, she was desirous of remaining till a change for the worse or better took place in her sister's son;

secondly, the colonial bishop I have spoken of was shortly expected to arrive in England, and would, of course, pay a visit to Ashe Priory, when the important question relative to the personality would be set at rest.

The dreaded blow was not long delayed, and our low-whispered apprehensions were bruited through the stately mansion by Dr Mitchell's announcement, that Francis Herbert was attacked by *scarletina*—a disease just then extremely prevalent, and very generally fatal. The rigidly demure, but withal demoniac aspect of Captain Toulmin—now again a constant and defiant visitor at the Priory—presented an unmistakable daily bulletin of the mortal progress of the disease, till the fifth day, when, mocking us with idle hopes, it appeared to be almost miraculously arrested. The fever had certainly abated, there was considerable moisture on the skin, and the pretty patient had enjoyed a brief but seemingly refreshing sleep. An incident arose out of this pause between life and death, from which I drew, perhaps unjustly, a terrible inference, whether fairly justified by the facts the reader will decide for himself. I was near at hand in one of the corridors, though not visible to the speakers, when I heard Captain Toulmin ask Dr Mitchell, who was just leaving the house, whether it was true that the little boy was, as reported, so much better. The physician replied that the child certainly was very much better, but whether the improvement would continue or not, he could not say. Dr Mitchell then passed on; Captain Toulmin entered the blue drawing-room, as it was called; and I, still unobserved by him, went into the sick-chamber, where it was my turn to watch, and sent Mrs Calvert, who was nearly worn out with fatigue and anxiety, to bed. It was the close of a dull December day, and when I sat down by the bedside, no candle, lest it should disturb the child, who was uneasily slumbering, having been lighted, it was quite dark, save for a faint starlight which shone coldly in through the casement. There was no one, I knew, except Captain Toulmin in the blue drawing-room, the door of which I heard once, twice, thrice gently opened, and footsteps, light, stealthy footsteps, approach the sick-chamber, pause irresolutely, as it were, and go back again. Once more the steps approached, and this time came so near that I distinctly saw—the door being partially open for the admission of air—the shadow of a man upon the wall just within, and in the attitude of listening. Two or three slight knuckle-taps on the door followed, to which I, astonished, anxious, but not in the least alarmed, did not reply. The next instant, Captain Toulmin entered the chamber, walked lightly and swiftly towards the bed, on the opposite side to where I sat, and drew back the curtain. 'Captain Toulmin,' I exclaimed, not loudly, suddenly standing up and confronting him, 'you here!' I could not see his face distinctly, and the start of terror or surprise, which he could not repress, I would gladly not have seen. His agitation, from whatever cause arising, was not easily mastered, and his voice shook uncontrollably as he, not immediately, replied: 'Oh, it's you, Miss Redburn—how is the—the child?'

'Better, sir, considerably better, as I heard Dr Mitchell tell you not many minutes since.'

'True, true—I—I know; but it struck me that the nurse, or—or whoever might be here, could give me more positive, more decisive information before I left the Priory for the night. Good-evening, Miss Redburn.'

This was all that passed, and it scared me terribly—not at the moment, curiously enough, but upon after reflection. If he *did* intend—undeterminedly, as I think, at the worst—intend evil to the child, and had not been balked, he would have needlessly stained his soul with murder; for before the next day dawned, the disease had accomplished its mission, and the child heir-at-law was no more! I said nothing of the strange appearance of Captain Toulmin in the sick-room; and it was not, I think, till last year that I mentioned it, and then in a manner unintentionally, to Mary. It is a circumstance that my mind, even now, does not love to dwell upon.

Various were the emotions excited by that premature boy-death! Captain Toulmin—and, knowing the man, one can hardly feel surprised at it—had not the decency to affect concealment of his rampant joy; whilst the struggle in his lady-mother's breast between the promptings of sympathetic kindness of disposition and motherly exultation, was very palpable. Mrs Selwyn entered forthwith upon her accustomed course of hysterics; Mary, sad, grieving, but calm, entirely devoted herself to soothe the bitter anguish of the bereaved young mother; and as for the Rev. Charles Atherley, it was plain as truth that he was mentally accusing himself of detestable depravity and hardness of heart, because that pulsating organ *would* throb with a quicker, wilder beat, and illumine with a brighter glow the tell-tale tablet of his face.

Well, a few flutters only of the wings of Time sufficed to subdue, modify, and harden all those varying emotions and passions. Captain Toulmin, calmed considerably down from the fierce ecstasy of triumph with which he clutched the splendid prize that not very long since appeared to be hopelessly beyond his reach, had taken quiet possession of the Priory, already projected numerous modernising alterations therein, and had furthermore lent a favourable ear, it was said, to a deputation of numerous free and independent electors. These gentlemen had suddenly discovered, that of all the esquires in that division of the county, there was no one so admirably qualified to fill the legislative seat, soon to be vacated by the retirement of its present occupant from the fatigues and responsibilities of public life, as Captain Augustus Toulmin, of Ashe Priory. It was still but ten days subsequent to the funeral, when Mrs Selwyn, Mrs Herbert, Mrs Calvert, Captain and the Hon. Mrs Toulmin, the Rev. Charles Atherley, and myself, were all assembled in the library, awaiting, with at least outward composure, the expected arrival of his lordship, the colonial bishop, from whom a letter had been received, addressed to 'Mrs Herbert, Ashe Priory, Lancashire,' announcing his lordship's intention of calling on her that day about twelve o'clock, on his way to North Wales—a communication which, brief as it was, suggested the probability, aware as his lordship must have been of her son's death, that he was in possession, or cognizant, of a will distributive of the personals, in which Clara was interested. The desirableness of awaiting the bishop's arrival in order to the decisive clearing up of that essential point, was the reason, I understood, that we had not yet taken our departure from a residence where even its late mistress was already looked upon as little better than an unauthorised, unwelcome intruder. Clara, poor, timid, nervous Clara, would have yielded entire possession of everything without a struggle or a word of protest; but her sister—who really seemed made for occasions of difficulty, with such admirable firmness and decision did she act when there was a right to be vindicated, or insolence to be repressed—would not hear of her leaving Ashe Priory till after the bishop's visit; and Captain Toulmin, with a very ill grace, acquiesced, probably because he could not legally do otherwise.

It was, however, not near twelve o'clock when we

thus met, our being gathered together so early having been arranged—except as regarded the rector, who, as usual, was self-invited—by dear, fidgety, well-intentioned Mrs Toulmin. The worthy lady's never quite accurately poised mind had been sadly thrown off its equivocal balance by the domestic revolution that had just taken place, and a vague notion been set floating in her brain, that the lower-intimacy formerly subsisting between her son, Captain Toulmin, and 'sweet Mrs Herbert,' which had been so suddenly and mysteriously broken off, might be renewed by the genial influence of a sort of family-council, and possibly—so altogether flighty had she lately become—that the Right Reverend gentleman about to appear on the scene might conclude the affair connubially off-hand without further ado or delay, and thereby reconcile the conflicting emotions by which she was agitated. The aspect of the 'council' would have sufficed to convince any one less hopelessly obtuse than the Hon. Mrs Toulmin, of the desperate character of her enterprise. Her admirable son was lolling, sublimely insolent, upon a luxurious leather-chair near the fire, and fondling Ponto, a huge Newfoundland dog, one of the numerous quadrupedal additions he had already made to the establishment at Ashe Priory; his elaborately got up, sardonic smile and sneer saying, as plainly as he could make them say: 'You, Ponto, my fine fellow, are the only creature in this room I care a button for, or that has any right to be here.' Clara, as pale as a lily, frightened-looking—tears in her eyes, that a jarring whisper would cause to overflow—was standing at the further end of the apartment, as far away from Captain Toulmin as she well could be, with one hand clasped tightly round her sister's waist, looking, or pretending to look, over huge portfolios of prints and drawings she had seen twenty times before, which the delighted rector was lugging from the library-cases, and displaying before her with a zealous assiduity, infinitely rewarded by the occasional faint smile and blush of thanks which it called forth. For myself, seated near the fire opposite Captain Toulmin, I was soon thoroughly absorbed in painful retrospection, especially of the former scene I had witnessed in that library between Mary and Captain Toulmin, and the different positions in which they stood to each other then and now—a train of ill-boding reverie, from which I was suddenly roused by loud, sharp, pellet-like sentences emitted by the Hon. Mrs Toulmin, the precise tenor of which I did not catch in answer to some observation of her son's, as was evident by his rude rejoinder: 'Really, madam, you are too absurd in persisting that a pastime which may have amused an idle hour or two, indicated a serious purpose. *N'est ce pas*, friend Ponto?'

This was said in a sneering, taunting tone, clearly intended to be heard and understood by the group at the further end of the library. That it was quite perfectly heard and understood, Clara's agitation and varying colour—the Rev. Mr Atherley's fierce, I had almost written fighting look, directed full at the insolent speaker—and Mary's angry, yet, if the phrase may be permitted, *pleased* disdain, abundantly testified. Captain Toulmin no more comprehended that puzzling expression of Mary's countenance than I did, though it greatly irritated him, or even he would not have replied to it by saying: 'As to your proposal of last evening, my lady-mother, that I should allow the fair widow of my cousin, Francis Herbert, a pension, or something of that sort, I do not, as at present advised, see any necessity for doing so; her portion of the hereditary Selwyn property being doubtless amply sufficient for the needs of an unencumbered young lady.'

I do not believe that this brutality was levelled at, or deliberately meant to annoy Clara; it was a sudden, savage retort upon Mary for the bitter humiliation to which she had subjected him in that very room, and which the queenly look she had now, as then,

assumed, must have vividly recalled to his mind, as it did to mine. 'Mary,' I for the hundredth time mentally exclaimed, 'is wonderfully changed. Her husband, I remember, was a person of distinguished air and carriage; it must have been through long companionship with him that she has learned that lofty bearing.'

The Hon. Mrs Toulmin said something I did not hear, to which Mary replied: 'Pray, do not apologise, my dear madam: your son's words, I have no doubt, quite faithfully reflect his peculiarly constituted mind. I have only to remark, though it is scarcely worth while to do so, that under no possible circumstances will Mrs Francis Herbert condescend to hold the slightest avoidable intercourse with Captain Toulmin. As to pensions, it is quite possible he may yet be the suppliant to her for such favours, instead of the bestower of them.'

'Come, come,' interposed the Hon. Mrs Toulmin, who alone of us all did not appear to heed the implied menace contained in the last sentence; 'that is a little too harsh: you should not forget'—

'I forget nothing, my dear madam,' interrupted Mary; 'and I must beg that the subject be let drop. These painful, but, I have no doubt, fleeting trials,' she added, addressing the excited rector, and seating herself on a couch beside her sister, so as to screen her from observation, 'will, I trust, be sanctified to her, and—Ha! here, at last, I hope, is the bishop's carriage.'

It was the bishop's carriage; and in a very few minutes the right reverend gentleman entered the library, and saluted the two sisters with an almost undignified briskness of cordiality. To Clara he addressed a few words of pious condolence; congratulated Mary upon her health and cheerful looks; inquired for her sons; appeared surprised they were not at the Priory; then made a comprehensive bow, and seated himself: his stay could not, his lordship added, be longer on this occasion than a quarter of an hour at the most, he having to attend a church missionary-meeting twelve miles off at three o'clock precisely; but on his return he would, if permitted, make a longer stay. This being the case, instead of adjourning to partake of the luncheon prepared in the dining-room, some sherry and biscuits were brought into the library at his request.

'Your lordship being so pressed for time,' presently observed Captain Toulmin, 'will hardly be able to do more than acquaint us with the general purport of the important papers forwarded to your address immediately after the decease of Mr Edmund Herbert.'

'This gentleman is——?' queried the bishop, averting his gold hand-spectacles from the speaker's face towards that of Mrs Calvert.

'Captain Toulmin,' replied Mary quickly. 'This lady's, the Hon. Mrs Toulmin, son.'

'I remember—I remember: a distant relative of the family's. Well, sir, I *did* receive some important papers, as you mention; that is to say, they would be important were any one insane enough to dispute that a Herbert could have contracted a valid marriage with an estimable lady, though not of his own rank in life.'

'No one wants to dispute that, your lordship must be quite aware,' said Captain Toulmin.

'Exactly so,' replied the bishop; 'in which case the papers are *not* very important.'

'There was no will, then, amongst them, I conclude?'

'There was not,' said the bishop, 'which I regret—which I regret,' repeated his lordship, who had paused for a moment, startled by the demoniac glance of triumph that Captain Toulmin darted at Mary; 'as it would be more satisfactory to all parties if his wishes could be known with precise accuracy. This lady, Mrs Francis Herbert, he intended, as I know from one of his letters, to provide handsomely for. But, after

all,' added the bishop, 'the absence of a will can be of little consequence, under the actual circumstances. Edmund Herbert knew, as I know, that his intentions will be substantially fulfilled, as certainly as if engrossed and sealed upon parchment.'

'Permit me to differ from your lordship upon that point,' said Captain Toulmin with a sneering laugh: 'I have already declared that I feel bound by no obligation, moral or legal, to provide for Mrs Francis Herbert.'

'You have already declared!' said the bishop, looking bewilderedly towards Mrs Calvert. 'Really, I don't understand! What does the gentleman, Captain Toulmin, mean?'

The bright smile curling Mary's lip and dancing in her eyes, sent a wild electric thought, hope, through me; and so fiercely did my heart beat with the bare imagination flashing in my brain, that I caught at the back of a chair for support. But no—no, that were too good—too glorious to be true; and yet—

'Not understand me!' Captain Toulmin was saying the while, though, why, I know not, his voice sounded as if speaking at a great distance off. 'I do not, for all that, speak in parables. The late heir-at-law to the Herbert property, Mrs Francis Herbert's son, being dead, I am of course the present heir-at-law: that is plain English, I believe.'

'The late heir-at-law, Mrs Francis Herbert's son, being dead,' echoed the bishop, still with his eyes intently fixed upon Mrs Calvert, 'he is of course the present heir-at-law!'

'Your lordship must understand,' said Mary, 'that I have disclosed nothing: I had powerful reasons for not doing so till you were present.'

'Oh, now I comprehend,' exclaimed the bishop, rising from his chair, a motion which, from sympathy, I suppose, lifted everybody else at the same moment to their feet. 'It is not known, then, to you, ladies, and to you, gentlemen, that this lady, who, for perfectly justifiable reasons, has for a time borne the name of Calvert, is in reality the widow of Mr Edmund Herbert, to whom she was espoused by myself, in the church of the parish of which I was then rector, in his own proper name; and that, consequently, her eldest son, *not* Captain Toulmin, is the heir-at-law to the Herbert estates, real and personal.'

A silence like that which follows crashing thunder—a silence that could be felt in the audibly beating pulse, followed the bishop's announcement. What others felt, or how they looked, I know not; I remember only that my own almost suffocating emotions at last finding vent, I threw myself, in a paroxysm of sobs and tears, into Clara's arms, almost strangling her in an excess of delight very little short, for a time, of delirium. When I partially recovered, I saw that the terrible counter-stroke had prostrated Captain Toulmin, who was lying, pale and senseless, upon a couch—his mother, to whom Mary was speaking kindly, standing over him, chafing his temples, and wildly sobbing. Then the scene closed in again, so far as I was concerned, for I fainted, and was carried insensible to bed. In truth, I had been weak and ill for some days past, and was therefore not so well able as usual to bear up against such a sudden revulsion of feeling.

I think I only need add, by way of postscriptum, that the Hon. Mrs Toulmin is still a permanent guest at Ashe Priory; that Captain Toulmin, who was treated much better than he deserved, is an officer in the service of Austria; that Mary is, if possible, a more admirable person than ever; that her two sons are fine young men, who will, I doubt not, some of these days, do honour to the ancient, but, there can be little doubt, in some degree, till the introduction of fresh blood, partially decaying stock of the Herberts; that Clara is the happy and honoured wife of the rector—again a mother, and quite as much mistress of Ashe Priory as

ever she was; that Mrs Selwyn has been of necessity relegated, upon a sufficient income, to Beach Villa; and, finally, that I have been for a long time settled in London, and that my name, when I left Ashe Priory, ceased to be Redburn.

### THE REFORMER OF TURKEY AND HIS GAZETTE.

WE do not read much in what are called the War-books; but in dipping into the volumes, we occasionally alight upon passages that have more than a transitory interest. In a work now before us, for instance, which gives an impromptu history of Islamism, commencing with the biography of Mohammed from his birth, we skip over with suspicion those portions that ought to have taken years to write instead of months or weeks, but give ourselves up with perfect faith to the off-hand sketches of existing things that are evidently drawn from personal observation.\* The author does not paint the Turks quite *en beau*; but he has confidence in the reality of the civilisation they are commencing, and looks with hope to their future. This civilisation, our readers know, is spick-and-span new, and some deny its title to the name of civilisation at all. The last sultan, Mahmoud, and all his subjects, were semi-barbarians till the chief arrived at the calm and reflective middle age of man; at which point he seems to have been suddenly inspired with an ambition to imitate the refinement of Christian Europe. The slavery of the harem was discouraged, although the sultan did not dare to attempt to put it down. The number of captives for the market was diminished, and their consequently heightened value told favourably on their treatment. A man looked at his purchased slave in the light of a good round sum of money; more attention was paid to her health and comfort; jealousy demanded more in the way of confirmation than trifles light as air; even absolute misconduct did not seem to justify the master in condemning himself to so heavy a mulct, and recourse, therefore, was more rarely had to the ultimate measures hinted at in the verse of the poet—

There yawns the sack, and yonder rolls the wave.

As Mahmoud rose in civilisation, he uncrossed his legs, got up from his carpet, and seated himself decently on a chair, like a Christian man. He rigged a table in his dining-room, covered it with a damask cloth, and overspread it with plate. His dishes and plates were of silver, his spoons of gold, and instead of his own unbelieving fingers, which he had hitherto used in dipping into the greasy pillauks, he had orthodox knives and forks. Mahmoud drank champagne at his meals: this was, in fact, his favourite beverage, and he sipped away at it till he became as glorious as any king in Christendom. Poor Mahmoud! his barbarous admiration of the Franks could not distinguish between their virtues and their vices; and so he became not only tolerant and merciful, but drunken, and the reforming sultan is shrewdly suspected to have died at last of *delirium tremens*.

It was Mahmoud who began those reforms in the army, the result of which we now read in every newspaper; but we are more interested in another step in advance made by this lover of champagne—the establishment at Constantinople of a Gazette. ‘This first Turkish newspaper,’ says Mr Neale, ‘was called the *Taakvimi Veekai*, or the *Tatler of Events*, and it was first issued to the public on Guy Faux Day 1831. No Guy in the streets of London ever attracted a greater

portion of inquisitiveness than did this first specimen of the Turkish press. I doubt whether the conspirator himself, when taken in the very act, with his lantern and matches, gave rise to more conversation, inquiries, suggestions, and execrations, than did this Turkish *Tatler*. Crowds assembled in the streets round any learned scribe who could spell its pages out to them; and the indignation of the old school knew no bounds at this fresh innovation upon their long-inherent rights of exclusive ignorance and fanaticism—the *padasta* and the vizier must have gone mad to countenance such a scandal. Curiosity, however, got the better of indignation. The most bigoted of the Turks slipped the atrocious article into their fathomless trousers, and carried it home with them, to examine its contents in the secret recesses of the harem. These, however, were the learned men who could read; the others flocked to the public cafes and *khatibs*, where they could share the misdemeanour with a crowd of their own class, and employ the services of persons who possessed the necessary accomplishment. These individuals rose at once to the surface of society. The heavens rained coffee, pipes, and paras upon them; and as the solemn audience sat around, stroking their beards, and staring in amazement as the recital went on, a spectator might have fancied that he saw the Moslem mind awakening, rubbing its eyes to find out where it was, and blinking in the new light of morning.

The paper was a decided success; and not merely in Constantinople, but throughout a great part of the empire. This appears marvellous, but it is full of hope. The Turks parted with their literary prejudices with less struggle than the army did with their sack trousers; and in a singularly short time the circulation of the *Tatler* became immense. In out-of-the-way places, such as Alexandretta and Antioch, our author himself was indebted to its columns for news of what was doing in Europe. ‘Some fair notion may be conceived of the varied instructive and amusing information the columns of this paper contained, when I state that through its medium ignorant bigoted old Turks, who had never travelled, even by a boat, ten miles beyond the town of their birth, whose education had consisted entirely in being able just to read and write their language—the latter imperfectly enough—the patterns of whose huge sherwals, and turbans, and zennars had been perpetuated in the same family through twenty generations—whose pride was plentiful, and who never condescended to smile; even these hard-headed and harder-hearted men, were enabled to form some indistinct conception of railways and steamers, and of the immense advantage which they must eventually prove to the advancement of commerce and science. The projected aerial ship was perfectly described, and constituted the theme of endless conversation. Being a Frank, and, above all, an Englishman, I was allowed no peace of mind or tranquillity, being supposed to possess perfect knowledge of the working and planning of so marvellous an invention. Day after day, week after week, the same incomparably dull old faces, all beard and inquisitiveness, preceded by the invariable pipe-bearer, followed by some half-score attendants and hangers-on, would be seen approaching the house, entering and taking precisely the same seat as yesterday, and recapitulating the same questions which, at the expiration of the first week, had been asked and responded to at least a score of times. Happily, the project exploded. The ship was a failure. The old Turks no longer looked nervously forward to the day when, turning out some fine morning, they would find the whole town gazing earnestly up into the air at Smith, and Brown, and Jones, and other adventurous travellers, who were ballooning it to Timbuctoo from the fabulous cities of Mexico. The *Tatler* explained to the Turks that the

\* *Islamism: its Rise and its Progress; or, the Present and Past Condition of the Turks.* By F. A. Neale. London: James Madden. 1854.

project was a failure, and then we were permitted some small peace of mind.' The great object accomplished by the *Tailler*, was forcing upon the Turks the knowledge that there existed other countries worthy of observation as well as their own. They began to doubt, while they read, whether they actually were, as they had hitherto believed themselves to be—a peculiar people, favoured, like the Israelites of old, with an especial patronage; and as the present war against a nation low down in refinement, brings them in friendly contact with the refined peoples of the West, it is not too much to hope that the change thus begun will go steadily on.

If we add that Mahmoud was a patron of art, and that pictures are now bought and hung up in Turkey—that he founded a school of surgery—and that he opened asylums for lunatics, who are now treated as patients, instead of being venerated as saints or prophets—we have said enough to shew that at least the point of the wedge has been inserted.

## THE MONTH.

### THE LIBRARY AND THE STUDIO.

#### THE LIBRARY.

THE migratory tendencies which so many people annually exhibit at this period of the year, have been much developed during the past week or two, by the beautiful weather with which we have been favoured. With a sky of a deep clear blue, that even metropolitan smoke seems unable to tarnish—with sunlight that finds its way into the duller nooks and corners, and with the thermometer, even in the shade, at a point that pleads most eloquently in favour of sea-breezes and sylvan coolness, we can feel no surprise that there is a general desire to escape from the stifling oppressiveness of a London atmosphere, in search of that buoyancy which only the country can afford. Already large detachments of health and pleasure seekers have departed by the various railways and steam-boats, to invade favourite rural spots and watering-places. Painters, sketch-book in hand, swarm, north, east, west, and southwards, to study new effects, and bring home materials for future triumphs. Literary men, such, at least, as are not fettered by the duties of journalism, swell considerably the tide of migration—only the rear-guard of the 'great world' remains. In a very short time, that, too, will be on the move. It may well be imagined, that in the state of semi-desertion into which the metropolis is falling, there is little activity to be noted in any direction, and scarcely any topic which provokes discussion, except the progress of the war. Literary intelligence is of the scantiest description, and without particular interest.

The Guild of Literature and Art, which had remained so long inactive as to engender a belief that it had fallen into a condition of hopeless torpor, has lately shewn symptoms of reviving animation. Having now overcome the legal difficulties which at one time beset its path, it has obtained a charter, and will, I understand, very shortly make a public statement of its intentions, and the mode in which it is to be carried on. It is to be hoped this statement will be explicit. In the meantime, an attempt has been made to establish another society of a somewhat similar description. The Literary Institute of the British Empire, is the title of this new project; and its chief object is to form literary men into a corporate body, and to establish a common hall or place of resort for the use of members. The scheme has grown out of another which, under the title of the *Athenæum Institute for Authors*, had been for some time in agitation, but without gaining much attention or support. It is to be hoped that the form in which

the new institution has been put forward, will be found more attractive than that of its predecessor. Some such institute as that proposed has long been wanted.

Complaints, iterated and reiterated in the public press, of the want of proper accommodation for the readers who frequent the library of the British Museum, have at last had some effect upon the supine and sleepy governing powers. A new reading-room, considerably larger than the overcrowded, ill-ventilated apartment now in use, is to be constructed in one of the open quadrangles of the building; and another change—the opening of the library at night, with proper precautions against fire—is said to be under consideration. By such an arrangement, the treasures of the national library would be accessible to a large body of men who are at present unable, from professional or other duties, to attend during the day. With all this talk of reform; we have not a word respecting the catalogue, which still continues to be a disgrace to the nation. What is called the New Catalogue, is tolerably well arranged and easy of reference; but the old catalogue, numbering some sixty or seventy volumes, and in very general use, is a mass of irregularity and confusion. A few days ago, I wished to refer to the works of a very well-known recent writer, and found his name in three separate places, without any reference from one to the other. Upon mentioning this circumstance to a friend, he lifted his eyes in a manner which said plainly, that I ought to think myself lucky in having found what I wished at all. The amount of time positively wasted over that catalogue in one week is incalculable; and the most annoying circumstance is, that a very little labour might remove all cause of complaint. A dozen ordinary auctioneers' clerks would, with the materials already existing, make a good catalogue in a month. These remarks lead me to a subject which is worthy of a passing notice—the rapidly increasing value of old books. To say that a rare volume is worth its weight in gold, is now no figure of speech. At the sale of the books of Mr Gardner of Chatteris, the other day, by Messrs Sotheby and Wilkinson, some of the lots realised the most astonishing prices. Caxton's black-lettered *History of Reynarde the Foxe* sold for L.195; his *Golden Legend*, for L.230. The first edition of Matthew's translation of the Bible sold for L.150. A first edition of Cranmer's Bible, L.121; and a first edition of Shakspeare—dated 1623—for the large sum of L.250. The entire collection, consisting of between two and three thousand books, sold for L.8171.

New books, however, do not meet with so good a market, and continue very little in demand. Of those that have been recently published, a work by Mr Patmore upon the *Deceased Celebrities of the Nineteenth Century*,\* has awakened some little attention, by statements of the author, which are alleged to be incorrect, and which, as affecting the characters of the persons to whom they refer, cannot be passed over in silence. Amongst other things, more or less calculated to provoke controversy, Mr Patmore affirms that the poet Campbell had no other share in the *Life of Mrs Siddons* which bears his name, than that of 'overlooking the manuscript,' and 'looking over the proof-sheets'—that the book was 'entirely prepared and composed by a rapid and off-hand writer, much employed by popular publishers, when called upon at a pinch, to supply the cravings of the literary market.' It was scarcely to be expected that a statement like this, made so positively, and yet wearing such an air of improbability, would be likely to pass unchallenged. The publisher of the work in question has written

\* *My Friends and Acquaintances, being Mind Portraits and Personal Recollections of Deceased Celebrities of the Nineteenth Century; with Selections from their Unpublished Letters.* 2 vols. Saunders and Otley.

to a literary journal, calling upon Mr Patmore to prove what he has advanced, and adducing, in support of his own opinion that the statement is altogether without foundation, a letter from Campbell, in which allusion is made by the writer to the labour he has bestowed upon the work, and to the conviction of himself and his friends with respect to its execution.

*Friends and Acquaintances*, though its texture is slight, and its statements, as we have seen, are open to question, is amusing reading; though more adapted for those who are old enough to remember the individuals mentioned, than for the general reader.

The only other book that has attracted much notice, is Mrs Harriet Beecher Stowe's *Sunny Memories*. Such persons as can fix their attention on anything at all in this hot weather, have felt bound to read these volumes; but the critics have, with pretty considerable unanimity, 'pooh-pooled' the whole production. Perhaps they expected too much. Perhaps they feel inclined to revenge on Mrs Stowe the fact, that they were carried away a couple of years ago by popular enthusiasm into elevating her a good deal above her merits. *Uncle Tom* has taken a deserved place in our literature; but it is not the place which its admirers at first endeavoured to force it into. At anyrate, *Sunny Memories* answers nobody's expectations; for the whole two volumes prove nothing but what might have been proved in a very few pages—namely, that the authoress egotises very agreeably, and was marvellously delighted with the reception she met with in England.

I mentioned before, that a very valuable literary treasure, an unpublished character, in verse, by Pope, of the Duke of Marlborough, had come into the possession of Mr Wilson Croker, who was preparing a new edition of Pope's life and works. In an anticipatory criticism of this work, inspired, it would seem, by the preliminary advertisement which has recently appeared, the *Athenæum* has brought forward a number of facts respecting the author and his writings which are of the most interesting kind, and which no biographer ever discovered. The chief feature in the very able and lengthy articles in the *Athenæum*, is the proof afforded that the correspondence of Pope, published with his own authority as to its authenticity, is far from genuine—alterations having been made to an extent that quite startles the reader who has always imagined the letters to have been, as stated, 'written in the openness of friendship—a proof what were his real sentiments as they flowed warm from the heart, and fresh from the occasion, without the least thought that ever the world should be witness to them.'

The writer in the *Athenæum*, who has evidently obtained access to many unpublished letters of Pope, prints them side by side with those which have hitherto been recognised as the originals, and thus presents in a new light, and free from obscurity or doubt, many circumstances which have proved a stumbling-block to all Pope's biographers. It is pleasing to find, that although these discoveries tend somewhat to lower Pope in our estimation, we have, from the same source, a complete refutation of the charge revived by Bowles, of an improper intimacy having existed between the poet and Martha Blount, and many incidents and facts brought to light which place Pope in a more pleasing and favourable position than he has yet occupied. Whether Mr Wilson Croker will distrust the information contained in the *Athenæum*, or avail himself of it, as suggested, has yet to be seen.

#### THE STUDIO.

With the close of the Royal Academy, it is to be hoped we have heard the last of Mr Hunt's fantastic picture, 'the Light of the World,' which has been almost the talk of the town this season. So many letters have been written concerning this picture, and so much criticism expended upon it, that it

seemed probable we were at last to be spared all further allusion to the subject; but, at the eleventh hour, Dr Waagen has passed his judgment upon this marvel of modern art, and the views he expresses are so sound and sensible, that it is matter of congratulation, rather than otherwise, that his opinion has been added to the number of those already recorded. Dr Waagen, as might be expected, is no admirer of the 'Light of the World,' or of the school to which the artist belongs. He shews that the composition of the picture is incongruous and contradictory, and that it arbitrarily unites two widely opposite tendencies of art. Of the Pre-Raphaelites generally, Dr Waagen says, that while imitating the great masters of the fifteenth century, they have imitated not only their beauties but their defects, utterly forgetful of the fact, that the works of that period attract us not by their defects, their hard outlines, erroneous perspective, and meagre drawing, but in spite thereof. Dr Waagen adds that in Germany, where the new school had, at one time, many disciples, artists have, in almost every instance, given up their faith in Pre-Raphaelitism, and returned to a sounder and more rational belief. When will our own painters follow such a laudable example?

The Hood Memorial is at length completed, and has just been erected over the poet's grave in Kensal Green Cemetery. The monument consists of a pedestal of polished red granite, surmounted by a well-executed bust. At the sides of the pedestal are bass-reliefs illustrating the *Bridge of Sighs* and the *Dream of Eugene Aram*; at the foot are placed a comic mask and the poetic lyre; and above, an inscription, stating the date of the poet's birth and death, and that the monument has been erected by public subscription. His own simple epitaph, 'He sang the Song of the Shirt,' is placed just under the bust. The general effect of the monument is very good; and Mr Matthew Noble, the sculptor, certainly deserves high praise, not only for the artistic manner in which he has executed the work, but for the generous spirit which has directed his labours—the amount for which he has completed the design being far from an adequate remuneration, in a pecuniary point of view. It is much to be regretted, that so interesting a memorial should have been inaugurated in a manner unworthy of the poet's memory. Paragraphs in a few newspapers had intimated that many distinguished literary men would be present at the ceremony. Tempted by this announcement and the fineness of the day, I proceeded to the cemetery at the appointed hour. In due time, about fifty people gathered round the monument; and then Mr Monckton Milnes, supported by a policeman as a kind of vice-president, recited an address. This was the beginning and end of the proceedings. Not a single literary celebrity was present. It would of course be absurd to suppose, that this neglect was owing to any want of sympathy with the object of the ceremonial.

Undaunted by the unsightly aspect of the colossal Egyptian figures at the Crystal Palace—which, but for the interest that attaches to them as the production of another age and people, would be unendurable as works of art—Signor Chardini suggests, in the *Journal of the Society of Arts*, the erection of an enormous statue to Shakespeare, which, in point of size, will put even the giants of Aboos Simbel to the blush. Signor Chardini proposes that the statue should be 100 feet high, and of cast iron; that the interior shall contain three floors, on each of which is to be an apartment of about eighty feet in circumference, and fifteen feet high; that, by an ingenious arrangement, light shall be admitted at various places not visible from the outside; and the top room shall be lighted by a roof of glass fixed in the head, and by the apertures of the eyes, those apertures being in due proportion with the rest of the figure—two feet wide! That the proposition should

have been made, is not surprising, precedents for such a work of art being afforded by Russia, Italy, and Bavaria; but the good taste of these colossal statues is somewhat questionable. Surely, in paying homage to genius, the mere size of our tribute can be but of little consequence, else let us at once change gold for copper, and our presentation-cups and purses of money will be large indeed. Such a statue as that proposed by Signor Chardini, might look very well hoisted upon a rock, and fixed in an open plain; but in the midst of houses and streets, it would be out of proportion to everything around. The *Athenæum* suggests Primrose Hill as a good site; but as Primrose Hill is one of the few places within a reasonable distance from the centre of the metropolis where a breath of fresh air may be obtained, it would be unwise to lumber it with a huge erection which must curtail a considerable amount of its space, and may or may not add to its beauty. Surely a national tribute to Shakspeare should be conceived in a less showman-like spirit than that which is suggested by this gigantic proposal.

### A FRENCH PATTERN.

THE other evening, when looking over a little French fashion-book, much prized for its pretty 'patterns,' my attention was arrested by one of a different kind from what I expected to find there. It is a history of the sacrifice of a ruling taste at the shrine of duty. Few who have not felt the *besoin d'écrire*, can imagine how strong a passion it may become; yet all, I think, will agree with me in considering Mademoiselle de Lézardière a literary heroine, and will sympathise in her struggles and her sorrows.

About the end of the reign of Louis XV.—thus runs the sketch I have translated—a young girl of sixteen years of age, living in a remote manor-house of Poitou, conceived and undertook to execute a work, the erudition of which might have taxed the learned perseverance of a Benedictine monk. At this early age, she began to write the *Theory of the Political Laws of the Ancient Monarchy of France*, from its cradle to the eighteenth century—from the period of Roman legislation, to the edicts which then regulated the political relations of parliament.

M. de Lézardière, her father, often regretted having given her too masculine an education; he was anxious to forbid her embarking on such laborious investigations, and desired to lead her taste to subjects better suited to her sex. He did everything he could to oppose what he conceived to be so erroneous a direction of her talents; but Pauline had such faith in her own powers, that she defended her cause vigorously. She saw the greatness and the value of the object she had in view, and she felt an inward anticipation of success.

At this period, nothing of a satisfactory nature had been written on the political laws of France. Detached portions of history, such as related to the absolute power of the crown, the influence of the different orders—the clergy, nobility, and commons, or *tiers-état*—had their panegyrist and their censurers; but no comprehensive or conscientious political writer had arisen to grasp the whole, and to search for historical truth alone, unbiassed by party, in the study of the origin and development of public rights and privileges.

Mademoiselle de Lézardière longed to undertake the work thus neglected by others, and her noble ambition was to present it to her country.

The young girl's first historical essays were submitted to M. de Malaherbes, to the Duc de Nivernais, to M. de Breguigny, and to the Benedictine Don Poirier. They all admired her style, and appreciated the greatness of her views; and to facilitate the execution of her important plan, those new patrons of Pauline placed at her command all the books and documents she could desire. Twenty years passed over, devoted

to her laborious investigations, and she had completed one-half of her gigantic task, when the French Revolution broke out. She fancied that its publication might be of service to the state at a time when the fundamental principles of the French constitution were under discussion. Her work appeared in 1792, but during the turbulent violence of this period, it did not attract the attention she had expected. Mademoiselle de Lézardière, however, cared little for this neglect, as her thoughts and affections were now otherwise occupied. Her family, ardently devoted to the royal cause, was threatened with proscription. One of her brothers—a priest—fell an early victim to the popular excitement against the clergy; her mother died of grief on hearing of the sentence of death passed on Louis XVI.; and her father was arrested on suspicion. The crime of which he was accused was that his two sons, Paul and Sylvestre, were serving under the standard of La Rochejaquequin, in La Vendée. On hearing of the danger that threatened their father, these noble young men at once surrendered themselves as prisoners in his place. At their entreaty, their father was released, and they had the glory and happiness of dying in his stead.

In a state of despair, the heart-broken M. de Lézardière, with his daughter Pauline, buried himself in the most obscure seclusion. One of his sons, Joseph, an infantry officer, had emigrated. Charles, the youngest, while fighting in La Vendée, was made prisoner, and owed his life to the intervention of a soldier, who, recognising him, ran to him, and throwing his arms around him, exclaimed: 'If he dies, I shall die with him!' The council of war condemned the *rebel*, therefore, to exile instead of to execution. He was dragged from prison to prison, till at last he contrived to escape.

These domestic afflictions broke the spirit of Mademoiselle de Lézardière. She renounced her literary labours, and devoted herself to an obscure and monotonous life. She put from her all hope of the fame for which she had so long and so meritoriously struggled, to devote herself to her sorrow-stricken father, and live with him in retirement, forgetting and forgot. Her brother Joseph, on his return from emigration, had recovered some of his property. On their father's death, he persuaded his sister to join him at the remote Château de la Prunetière, in La Vendée. There she lived for thirty-five years, devoting herself with fervent piety to works of benevolence; undistinguished in outward appearance from the good women of the neighbourhood, who prayed beside her in the village church, and drawing from religion a balm for the great sorrows that had embittered her life.

Mademoiselle de Lézardière lived to the age of fourscore-years-and-one; she died in 1835, deeply lamented by the poor, whom she had so loved and tended in her latter days.

The literary reputation of this humble-minded woman has greatly increased since her death. A new edition of her *Théorie des Lois Politiques de la Monarchie Française* has appeared, under the superintendence of MM. Guizot and Villemain; and, in the opinion of competent judges, it combines profound erudition, rare sagacity, and new ideas, with strict and powerful logical views.

The illustrious historian, M. Augustin Thierry, has said of it: 'The work of Mademoiselle de Lézardière is complete, ingenious, and full of wisdom. She has manifested a remarkable power of analysis. She has sought out and weighed discreetly the most important questions, and has not lost sight of them until she has exhausted the subjects to which they relate; and she is never deceived as to the relative bearing and intention of the documents she has inserted.'

The writer in the *Journal des Demoiselles* goes on to say: 'We wished to make you, young ladies, acquainted

at least with the name of this noble-hearted woman, who consecrated her talents to the good of her country, but who did not allow the possession of genius of the highest order, to estrange her from the practice of the ordinary and domestic duties of life. The history of the pious and modest Mademoiselle de Lézardière may serve as a pattern to all, and a lesson to many.'

#### THE HYMENAL ALTAR.

Why are people about to marry always represented as going to lead or be led to the hymeneal altar? Are we in a Christian land? Here is a paragraph from a fashionable contemporary:—'Lady E. E., daughter of the Earl and Countess of E., is about to be married to the Hon. G. B., M.P.' Now, this reads like a bit of reasonable current history. Antiquaries, who may come from New Zealand to dig up mounds on the Thames, finding such a statement, will conclude that Lady E. E. and Mr G. B. lived in Christian times, and were members of a Christian church. But what will they make of the announcement in the same paper:—'Mr H. will lead to the hymeneal altar the youthful and beautiful Miss E. L.?' Will they infer that Mr H. and Miss L. followed the pagan rite? or will they assume that it was customary for ladies to be wedded at the communion-table, and misses at some other sort of shrine, known as the altar of Hymen? or will they suppose that marriage was a purely patrician institution—the lady being made a wife, and the miss being only made a lady? We, of course, know the facts—but we know them in spite of the report. We are aware that Mr H. is not about to lead Miss L. to the hymeneal altar. We know that there is no hymeneal altar in London. We are sure, moreover, that if there were, it would be the very last place to which Miss L. would consent to be led. Why, then, will our chroniclers go on talking of things that have passed away as if they were still living? Why prattle of hymeneal altar, when the thing meant is a communion-table—talking nonsense now, in order to puzzle learned pundits in the future?—*Lloyd's Newspaper*.

#### AMERICAN STATESMEN.

Daniel Webster was the son of a New Hampshire farmer in very moderate circumstances; Henry Clay, of a poor backwoods preacher. Martin Van Buren was too poor in youth to obtain a tolerable education; and it has been said of him in reproach, that he sold cabbages around the village of Kinderhook. Andrew Jackson was an orphan at an early age, and was left penniless, with nothing but his own efforts to aid him. Governor Vance, of Ohio, had been a plain farmer through life, and entered that state as a pioneer, with an axe on his shoulder and very little in his pocket. Joseph Ritner, former governor of Pennsylvania, served his time with a farmer as a regular bound apprentice; after which time, he for several years drove a wagon from Philadelphia to Pittsburgh.—*Newspaper paragraph*.

#### EXTERNALS OF A GENTLEMAN.

Cut off that beard which reaches to the waist—never let your hair grow lower than your ears—never let your nails be seen either long or in mourning. A black coat and trousers are the only ones that can possibly be worn at a first visit, a banquet, or a ball. Under these circumstances, a white waistcoat, or one of black satin, may be seen with equal propriety. Visits of ceremony demand dress-shoes and a white waistcoat. The hands should always be gloved; and a man of good society is known to dance only in white gloves. A distinguished man may be recognised by the fineness of his linen, by the elegance of his boots, the careful disposal of his hair, and the perfect fit of his gloves. Care should be taken never to appear anywhere without gloves: this is a great sign of good society. You may have one hand ungloved: this should be the hand you will give to a friend, if you meet one. Rings and heavy gold chains are in bad taste. The shirt-front should not show any buttons: it may, however, be finely embroidered. The collar should not be far above the neckcloth.—*Meilheurat's Manual of Etiquette*.

#### LEONORA.

LEONORA, Leonora,  
How the word rolls!—'Leonora.'  
Lionlike, in full-mouthed sound,  
Marching o'er the metric ground  
With a tawny tread sublime—  
So your name moves, Leonora,  
Down my barren rhyme.

So you walk, young Leonora,  
Down the mossy-alleyed wood,  
Head erect, majestic, tall,  
The meet daughter of the Hall;  
Yet with brown eyes soft declined,  
And a voice like summer wind,  
And a meek mouth, sweet and good,  
Dimpling ever, Leonora,  
In fair womanhood.

How those smiles dance, Leonora,  
As you meet the sun and breeze  
Under your ancestral trees:  
For your heart is free and pure,  
As this blue March sky o'erhead:  
And in the life-path you tread  
All the leaves are budding, sure!  
And the birds break into singing,  
And the primroses are springing—  
'Tis your spring-time, Leonora,  
May that prime endure!

But spring passes, Leonora,  
And the silent days must fall  
When a change comes over all;  
When the last leaf downward flutters,  
And the last, last sunbeam glitters  
On the terraced hillside cool,  
On the peacocks by the pool:  
When you walk along these alleys  
With no airy foot that dallies  
O'er the daisies and the moss,  
But with quiet step and slow,  
And grave eyes that earthward grow,  
And a matron-heart, inured  
To all woman has endured;  
All the sorrow and the loss,  
All the blessing and the gain—  
Could you meet that time of wane?  
Could you smilingly lay down  
Happy girlhood's flowery crown,  
And take up, O Leonora,  
Womanhood's meek cross?

Ay: your eyes shine, Leonora,  
Warm and true, and brave and kind;  
And although I nothing know  
Of the maiden soul below,  
I in them good omens find.  
Go—enjoy your spring-time's hours  
Like the birds and bees and flowers—  
And may summer skies bestow  
On you just so much of rain—  
The blest baptism of pain,  
As will make your blossoms grow:  
May you walk, as through life's road  
Every noble woman can,  
With a pure heart before God,  
And a true heart unto man:  
Till with this same smile you wait  
For the opening of the gate  
That shuts earth from your tired eyes;  
Leaving children's children playing  
In those woods you used to stray in;  
Glad you enter, Leonora,  
Into Paradise.

# CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 34.

SATURDAY, AUGUST 26, 1854.

PRICE 1½d.

## THE BRINGING FORTH OF THE DAILY NEWSPAPER.

THE mechanical wonders of the daily newspaper have been described a hundred times. We have been made familiar with the great inventions whereby so many thousand lines are put into type, and so many thousand copies laid on the breakfast-tables of the country; the lines having been only a dozen hours before in manuscript, and the copies blank paper. In truth, it would be difficult to point out any fact which combines in itself so many of the prodigious successes of modern science, as the great fact of a London morning paper lying upon an Edinburgh counter at eight o'clock in the evening. Twenty-four hours before, the matter of two octavo volumes existed only in manuscript—part of it, indeed, in the brain of certain persons, at a distance of four hundred miles.

The mechanical arrangements by which this feat is effected are, as has been said, sufficiently familiar to most people: of the intellectual arrangements, much less is known. Few ever think of the direct process whereby such a heterogeneous mass as the columns of daily papers present, is collected, digested, and put into forms so clear, regular, and connected, during the course of one-half of a single night; or how half-a-dozen articles—which would be among the brightest in a collection of essays—are thrown off at an hour's notice, with small preparation, amid the confusion of facts yet uncertain, and after the toil and pressure of the labour of the day. It may be interesting to watch, during its progress, the development of a daily newspaper.

Enter the working-office of the paper in the middle of the day: it is like a geological interval between the extinction of one creation and the formation of another. You go up a narrow, creaking staircase—dirty and ink—such as would disgrace a collier. Everything is still. Half-way up, in a little dusty room, sits a man with a pot of porter before him; he wonders what on earth you can want at that time of day. If you succeed in penetrating to the working-room—not yet put in order—your impressions will be curious. On one side lie the slips of an article which cost the writer infinite pains and satisfaction—on another, the fragment of a dispatch, containing news of the utmost importance, which excited the whole office at its arrival. Both are now interesting myriads of people at a distance of many miles. Here they are crammed into a corner, covered with dirt, and forgotten by the persons who, a few hours before, were so much interested and excited about them. A new world is about to dawn upon the newspaper, and the past is already sunk and forgotten.

The newspaper world never thinks again of a thing when it has once done with it: with that world, each day's work is like the May-fly—brilliant and rapid for its hour, then lost upon the winds.

At the same time the editor, four miles out of town, is taking his breakfast. He glances listlessly over his paper, just to see how it looks; but it is a thing gone by with him as with the rest of his world: he would be lucky if, till his hour of duty, he could forget altogether that such a thing as a newspaper existed: but this is a happiness not allowed to editors of daily papers. At every sip of his tea—amidst the prattle of his family—amidst the chat of his friends—the inquiries of his wife—rises in dreary solemnity the image of the next morning's paper. Never did coming event cast its shadow before more effectually than the coming newspaper throws its shadow over the mind of its ill-fated editor. What are to be the general subjects for the day—the particular subjects, of course, depend upon what may turn up—whether he shall be indignant on judicial abuses—proud of commercial prosperity—virtuous on the rich—sentimental on the poor—indulgent towards the Lords—piquant towards the Commons—all this—how it is to be done, and who is to do it, will intrude upon his thoughts, however closely he may fix his eyes on the flaxen hair of his pet daughter, or the bright illustrations of the last new publication.

But between him and his next paper there yet intervenes an important ceremony: he has to meet the proprietors at four o'clock. In the old times, those of which our fathers have told us, these meetings were very pleasant. When there was yet a race amongst the newspapers for the first place in influence and profit—ere a single publication had overshadowed all the rest—when personal communications from men of official rank were matters of course—when the destinies of the country seemed to hang upon the press—when the great public pressed less, and great people pressed more upon the newspapers—when the race for earliest intelligence was eager and fiery, and £200, and occasionally very much more, would be spent on a single dispatch—in those days, the four o'clock meetings embraced matters of extraordinary interest and excitement. It is much duller work now. If the paper succeeds so far as to pay a dividend, the eagerness of gain sends the proprietors—starched, white-cravated men—closely into the accounts; the penny-a-line book is too large; a reporter may be dispensed with at such a court; a correspondent at such a station. If the great topics of the day are touched upon, it is in the mercantile view of circulation. If a great name is to be connected with the establishment, it is asked if it will increase the sale. If, on the other hand, the affair

does not pay, the poor editor has a sad game to play: his mode of handling general topics, the style of his articles, his choice of features, his management of contributors, and a thousand other matters, are liable to be discussed in an impatient and cross-grained humour, which is not likely to lighten the mind of a man who has a mental burden of such weight to lift and carry every day of his life. It is true, there is commonly a business-manager attached to the paper, who ought to take much of this off the editor's hands; and so he generally does, under new arrangements and new proprietors. But the editorial duties are so intimately connected with the business, under all its forms, that the load gradually and naturally slides from the manager to the editor, who ends by having all the plague, whether he has ostensibly the business or not.

It is seldom the fortune of the editor to fall upon the golden days of a large profit; then, indeed, these annoyances are spared him, and his position is in many respects enviable. The next best position to this is to have rich proprietors, who have taken the paper for the purpose of promoting a crotchet or a principle, and are comparatively indifferent as to the expenses. A few strong articles, good personal praise, and a special tone, suffice to keep these men in good-humour; and their editor has an easy time. But this seldom lasts. Such a hobby is terribly expensive, and wearies out most people after a few months.

Our editor has got rid of his proprietors; he has now his contributors to attend to; persons from influential quarters with messages or articles, are to be seen and satisfied; new hands are to be engaged for the Gallery, or elsewhere. No wonder the candidate is somewhat fidgety at the approach of the great *chef*, for it is a question with him between starvation and £300 a year. It is one of the misfortunes of metropolitan journalism, that its members, instead of beginning with small salaries, and rising gradually and certainly, begin at once with five guineas a week. With this they live famously for a time; but a change intervenes; they are thrown out, and left with nothing. But we cannot stop now to dilate on a subject on which so much might be said, and on which so much depends in the state of modern literature. The editor has fulfilled his engagements; let him go home to his dinner; we shall not want him again till nine.

Meanwhile, the editorial apartments begin to exhibit some slight signs of life. A few packets have found their way to the tables—some of the reports of the day, parcels from penny-a-liners, and letters of correspondents. One or two of the parliamentary staff drop in, to make inquiries about the arrangements of the evening. It is a slight gust before the evening's storm, and drops into silence soon after five.

Between seven and eight, in walks the sub-editor, and with him begins the regular business of the evening. He is a pale, worn-looking man the sub-editor. Hard and drudging work all through the dark hours, from seven till four, six days out of the seven, and with only a fortnight's holiday in the year, tell grievously on a man's constitution. He is well paid; but where is the enjoyment of money to one whose day is spent in providing rest against the exigencies of the night? However, rested or not, there he is, looking on the accustomed packets upon his table. Half of these—reports of the law-courts, or communications from known and accredited persons—he hands at once to the printer without further examination. He then sits down to the 'flimsy,' as the communications are called of the penny-a-liners—who, by the way, should be 'three-halfpence-a-liners,' three-halfpence a line being their usual honourarium. With these gentlemen he has a world of trouble. Being paid by the yard, they have of course a direct interest in lengthening their measure. This they might do by amplifying incidents, or inventing a few supplementary particulars; but this the

penny-a-liner never does; although, for the most part, the poorest of poor fellows, he is thoroughly conscientious as to matter of fact. His amplifications are sentences of pathos, compound epithets, and little pieces of humour. He has, perhaps, sent in some penny-a-lining matter every day of his life for ten years. During that time, he has certainly never known a single instance in which his pathos, his humour, or his epithets, have actually found their way into print. The sub-editorial pen is most ruthless in its erasures. The sub-editor, too, having often the choice of several accounts of the same occurrence, chooses naturally that with the least ornamental superfluity, as giving the least trouble. Yet, nothing can cure these gentlemen of their passion for eloquence. The same heroic flourish in a shipwreck, the same magnificent indignation in a murder, expressed in terms of sublimity which Milton never thought of, still, night after night, solicit publication, only to have it refused. The heroism of genius must be truly great to resist such eternal rebuffs! If authors lose half their praise, because it never can be known what they blot, what is to be said of penny-a-liners?

The foreign editor, or rather sub-editor, makes his appearance about half-past eight. This functionary, like others, has of late years had his glories dimmed. The incessant activity of 'our own correspondent' leaves him little to do. His work, in former times, used to include the memorabilia of all Europe: at present, it is mainly confined to what is found in the German papers. These multifarious productions, from holes and corners beyond the reach of the corresponding system, often contain facts of interest when least expected. These, and a few gleanings from the Italian papers, form the substance of the foreign work now done at home; and this last source produces so little as to be scarcely worth notice. In these days, when periodical-writing reaches every extreme, from the highest point to the lowest, it would be difficult to find any publication more utterly lifeless, pointless, and uninteresting, than an Italian newspaper.

A heap of country newspapers is lying on the table. If these papers were what they ought to be, they might furnish our sub-editor with the means of placing the state of the nation before the public with unrivalled certainty and completeness. In the country districts, the workings of the law, the state of prisons, of workhouses, of agriculture, of religious opinion, are known to every diligent inquirer; and if these things were properly gathered by the local editors, the daily papers in the metropolis could form a summary of the great facts of the nation, which would utterly throw into the shade the reports of parliamentary commissions. England might know itself every week, instead of waiting for enlightenment every two or three years at the hands of peripatetic philosophers, who have just begun to comprehend the district, when they are called somewhere else. Unfortunately, the local newspapers, with a very few exceptions, tells nothing of all this. Observe how languidly our sub-editor glances over its columns, as if fulfilling a duty he cared little about, and from which he expected but small fruits. His scissors are inserted at last, only to cut out the notice of the consecration of a church, a colliery accident, or a cabbage of preternatural growth. Let such country papers as aim at higher things, pardon us if we lament that so few of their brethren resemble them: great are the opportunities of all, since the country knows or can know the country, while London is far from having the power of knowing London. Hitherto, there has been little either of excitement or amusement in the office; the first sounds of either come from the Reporters' Room. By this time the debates have become heavy, and have brought with them a host of anecdotes—the snubbing given by the minister to a troublesome querist, the absurd look of such a member when he

was called to order, the bull of one man, the fantastical argument of another, are—or rather were, for we must again speak in the past tense—an unfulfilling source of jest and merriment—often just, piquant, and well aimed. They were a gay, rattling set, too, the reporters, with their working-coats, which might have come fresh from Houndsditch, capering and playing pranks in a close, mouldy room, black with the ink of ages. Now, the liberality and sense of convenience of the parliament and its architect have spoiled all the fun. In the gentlemanly, well-contrived lobbies of the Reporters' Gallery is to be found all the accommodation requisite for giving the senatorial eloquence in its full detail. The reporters work silently, under the eye of authority, with the leaden atmosphere of legislation pressing heavily upon them. They make but little use of the jolly old room at the office. They have become, in consequence, staid and gentlemanly themselves, as befits official functionaries, many of them appearing in the gallery in dress fit for a dinner-party, and which would have struck their predecessors with astonishment. The tact necessary for a reporter is greatly diminished. Of old, it was a great point when an eminent speaker fell to the turn of the reporter best qualified to manage him. One was good for an argumentative, another for a humorous debater. At present, the great speeches are written out at full length, or if shortened, it is by omission rather than abridgment. A simple readiness in short-hand serves instead of the able and often singular dexterity with which the reporters in past days were wont to condense without injuring the wit, wisdom, and follies of parliamentary effusions. Condensation is now chiefly applied to unimportant speeches, where the style matters but little.

At about half-past nine, the editor himself makes his appearance. By this time it has become tolerably clear, as a general rule, what will be the special demands on his attention: it is but seldom that, after this hour, either news arrives or anything turns up in the debates requiring a special article. He is, therefore, able at once to arrange the subject of the one or perhaps two leading articles not already provided. Sometimes, however, it is necessary, from some unforeseen occurrence, to get up a leader at a later hour; and the commotion to obtain at a moment's notice the right thing from the right person, is quite wonderful. This is what the continental papers find most to admire in the English. Their articles are uniformly got up the day before; their writers have no notion whatever of working on the spur of the moment. The Paris paper of Tuesday is settled, written, and half printed by noon on Monday—at a time when an English newspaper would scarcely have its doors open, and more than half its staff would be fast asleep. Some of the very best articles in our papers have been written in this hasty way: the hurry of the moment produces a vigour and excitement *sui generis*; but it is not everybody who is to be trusted, for as there is no time to look up facts, a man not perfectly careful, or not perfectly well informed, may be betrayed into awful blunders.

The editor then lounges probably into the sub-editor's room, to hear the day's scandal, and form some estimate of the space and importance of general topics. This is by far the most lively time of newspaper work. You have the consciousness of living a day earlier than the rest of the world; occurrences are fresh, and have not been spoiled by the jokes and commentaries of the herd; the masquerade-dresses of the world are new again, and you have the first look at them. Editorial feelings require some such stimulus to brace and nerve them to the proper point.

With a tolerably clear idea of his paper now before him, the editor re-descends to his room. His next task will be one of much more importance than is generally

has accumulated during the day. In the multitude of facts, incidents, grievances, suggestions, offered by this correspondence, lies an immensity of the special interest attaching to the chief morning paper. The other newspapers get the individual political opinions of their own set, but very little beyond. On the other hand, the mass of fact alone in the occasional correspondence of the *Times*, is sufficient to set up an ordinary paper. Besides these, there are the whims and caprices of all the world; the thousand little adventures, fancies, and whimsies, which bubble up in the everyday life of ten millions of people; all the multifarious mishaps, hopes, fears, and ideas of twenty-four hours of society—matter much more amusing than private strictures on this or that debate; or the solemn assurance of A. B., that Lord C. is the worst man possible for the duties of his office. The variety of topic, style, and feeling, in the 'letters to the editor,' is worth anything to the said editor: it saves him a world of thought and trouble in his efforts to vary and enliven his paper. The choice given to the editor of the *Times* in the myriads of the letters he receives, is no small element in the success and superiority of the journal. Another point to be observed is, that a man, writing under the smart of provocation or injury, usually writes forcibly; and many of these letters—the majority of them, indeed—are singularly well written. Their business, matter-of-fact, and often homely style, serve admirably to set off the studied tones of communications purely literary. The letters to the other papers are not from the same class of persons: they come from talkers at the clubs, oracles of a set, who have picked up one of the threadbare coats of a great question, and send it, with their compliments, to the editor. This matter settled, our editor, if the news and topics of the day are not particularly heavy, unlocks his desk, and extracts therefrom sundry articles of literature on general topics, selecting, for variety's sake, that which contrasts most with the rest of his night's matter. In its reviews, the *Times*, again, occupies a peculiar position. The other papers usually intrust the reviewing duty to some of the staff of reporters. These men are clever and trustworthy, and a partial notice is a great rarity; but they are wont to look upon their task as a work of supererogation, of which it is their principal business to get rid as soon as possible. The *Times*, on the contrary, seldom reviews, except when it intends to produce an effect; intrusts the work to a specialist; and has frequently published some of the most striking pieces of criticism in our literature. To create an effect, wherever an effect is possible, has been uniformly the tactics of that paper, and we all see their success.
